The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

14. ABSTRACT

This Remedial Investigation/Feasibility Study Report for the Building 1200 AOC presents physical characteristics, geology, and hydrogeology of the Building 1200 AOC; compiles historical and newly acquired environmental data; summarizes nature and extent of contamination in soil, surface water, and sediment; evaluates contaminant fate and transport; provides human health and ecological risk assessments; identifies response actions, screening of remedial technologies and process options, develops remedial alternatives to address chemicals of concern (COCs) presenting unacceptable risk; and presents a recommended alternative to meet the remedial action objective at this AOC. To achieve National Guard Training and an unrestricted land use scenario for soil, sediment, and surface water, this report recommends implementing "Alternative 2: Attain National Guard Training and Residential Land Uses" to excavate shallow surface soil that exceeds the manganese CUG for the National Guard Trainee at locations B12ss-016M and B12ss-017M.

15. SUBJECT TERMS

Cleanup goals, remedial action objective, risk assessment, weight of evidence, nature and extent, fate and transport, remedial alternative

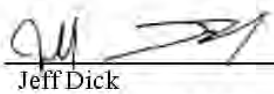
CONTRACTOR STATEMENT OF INDEPENDENT TECHNICAL REVIEW

Science Applications International Corporation (SAIC) has completed the Remedial Investigation/Feasibility Study Report for Soil, Sediment, and Surface Water at RVAAP-13 Building 1200 at the Ravenna Army Ammunition Plant, Ravenna, Ohio. Notice is hereby given that an independent technical review has been conducted that is appropriate to the level of risk and complexity inherent in the project. During the independent technical review, compliance with established policy principles and procedures, utilizing justified and valid assumptions, was verified. This included review of data quality objectives; technical assumptions; methods, procedures, and materials to be used; the appropriateness of data used and level of data obtained; and reasonableness of the results, including whether the product meets the customer's needs consistent with law and existing United States Army Corps of Engineers (USACE) policy.

Jed Thomas, P.E. — 10/7/10
Study/Design Team Leader — Date



Corey Pacer, P.E. — 10/7/10
Independent Technical Review Team Leader — Date

Harry Fatkin — 10/7/10
Risk Assessment Reviewer — Date

Significant concerns and the explanation of the resolution are as follows:

Internal SAIC Independent Technical Review was conducted on the Preliminary Draft version of this document. Subsequent versions of this document (e.g., Draft and Final) incorporated changes based on the technical reviews of USACE, the Ohio Army National Guard, and the Ohio Environmental Protection Agency. Internal SAIC Independent Technical Review comments are recorded on a Document Review Record per SAIC quality assurance procedure QAAP 3.1. This Document Review Record is maintained in the project file. Changes to the report addressing the comments have been verified by the Study/Design Team Leader. As noted above, all concerns resulting from independent technical review of the project have been considered.

Jeff Dick — 10/8/10
Principal w/ A-E firm — Date

EXECUTIVE SUMMARY

ES.1 INTRODUCTION AND SCOPE

This Remedial Investigation (RI)/Feasibility Study (FS) report addresses soil, surface water, and sediment at the Building 1200 area of concern (AOC) at the Ravenna Army Ammunition Plant (RVAAP). The Building 1200 AOC is designated as RVAAP-13. This document was prepared by Science Application International Corporation (SAIC) under the United States Army Corps of Engineers (USACE), Louisville District, Multiple Award Remediation Contract (MARC) W912QR-04-D-0028, Delivery Order No. 0001, entitled 2008 Performance-Based Acquisition (PBA) for Environmental Investigation and Remediation at RVAAP. This RI/FS report was prepared in accordance with the Ohio Environmental Protection Agency (Ohio EPA) *Director's Final Findings and Orders* (DFFO) for RVAAP, dated June 10, 2004, and conforms with Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and National Contingency Plan (NCP) requirements.

This RI/FS report for the Building 1200 AOC presents the following:

- A description of the operational history and environmental setting for the AOC.
- A summary of the field activities and results of the Performance-Based Acquisition 2008 Remedial Investigation (PBA08 RI) conducted from February 2010 through April 2010 at the AOC.
- A description of the nature and extent of contamination, including the identification of site-related contaminants (SRCs) by screening all eligible data against background concentrations, essential human nutrients, and frequency of detection/weight-of-evidence (WOE) screening.
- An evaluation of contaminant fate and transport by identifying contaminant migration chemicals of potential concern (CMCOPCs) and contaminant migration chemicals of concern (CMCOCs) that may pose a future threat to groundwater.
- A human health risk assessment (HHRA) to identify chemicals of concern (COCs) and an ecological risk assessment (ERA) to identify chemicals of potential ecological concern (COPECs).
- Conclusions of the RI report including the identification and extent of COCs, which form the basis for conducting the FS.
- Identification of a remedial action objective (RAO) for contaminated media at the AOC.
- Identification of applicable or relevant and appropriate requirements (ARARs).

- Identification of general response actions (GRAs) and screening of a range of remedial technologies to reduce risks to human health and the environment at the AOC from COCs identified in the RI report.

- Development of remedial alternatives from appropriate GRAs and remedial technologies and evaluation of alternatives against criteria specified by CERCLA.

- Conclusions of the FS and a recommended alternative.

Under the scope of this RI/FS report, the term sediment equates to periodically inundated sediment as defined by RVAAP guidelines. The scope of this report does not include full evaluation of groundwater contaminant nature and extent, risk assessment, and remedial alternatives (if required). Groundwater will be evaluated as an individual AOC for the entire facility (designated as RVAAP-66) and addressed in a separate RI/FS report. However, the potential for soil contaminants to leach to, and migrate in, groundwater is evaluated in this RI/FS report to determine whether soil remedial actions to protect groundwater may be necessary. Figure ES-1 provides a map of the Building 1200 AOC.

ES.2 AOC DESCRIPTION

The Building 1200 AOC was designated as the Ammunition Sectioning Area. From 1941 to 1971, the AOC was used for ammunition demilitarization, which consisted of disassembly and removal of explosive charges using steam to melt-out the explosives. The primary operations building was Building 1200, which was a 30 ft by 20 ft combined reinforced concrete and transite panel frame structure. The steam melt-out process generated explosives-contaminated wastewater (pink water), which discharged from the building via a pipe through a crushed slag gravel bed and into a drainage ditch connected to a 0.5-acre, unlined settling pond (located approximated 415 ft northeast of Building 1200). The depth of the settling pond is less than 3 ft. Overflow from the settling pond discharged directly to the ground surface southeast of the pond; there is no documented evidence of a discharge drainage ditch exiting the settling pond and flowing to a surface water body.

ES.3 FINDINGS AND RECOMMENDATIONS OF THE REMEDIAL INVESTIGATION

Quality assured sample data were collected during prior investigations completed in 1996 and 2004. These historical samples were collected using both discrete and incremental sampling methods (ISM). New data acquisition as part of the PBA08 RI focused on delineating the extent of contaminants identified in soil during prior investigations, assessing current contaminant concentrations in sediment, and investigation of subsurface soil, which had not been previously characterized. Data quality objectives (DQOs) and the scope of the PBA08 RI were outlined in the *PBA 2008 Supplemental Investigation Sampling Analysis Plan Addendum No. 1* (USACE 2009a). PBA08 RI sampling completed for the Building 1200 AOC included:

- Four ISM surface soil samples from 0-1 ft below ground surface (bgs) in the former Building 1200 operational area;

- Three discrete surface soil samples for chromium speciation analysis;

- Installation of three soil borings in the former Building 1200 operational area and collection of one discrete surface soil and one discrete subsurface soil sample from each;

- Installation of one soil boring in the former settling pond downstream of the former operational area and collection of one discrete sediment (0-1 ft bgs) and one discrete subsurface soil sample; and

- Installation of one soil boring to collect an undisturbed sample for geotechnical analysis.

ES.3.1 SUMMARY OF CONTAMINANT NATURE AND EXTENT

All available data were evaluated with respect to usability and screened to identify SRCs. Figure ES-1 illustrates all sample locations deemed usable for the RI. The evaluation of contaminant nature and extent focused on identified SRCs; key findings are as follows:

Surface soil (0-1 ft bgs) at the Building 1200 AOC contains the majority of SRCs. The highest concentrations of inorganic SRCs, explosives, propellants, and semi-volatile organic compounds (SVOCs) in surface soil were detected in the vicinity of the former Building 1200 footprint. The number and concentrations of SRCs in surface soil generally decreased and were more sporadic with distance from the former Building 1200 footprint. The PBA08 RI data indicated overall lower concentrations of SRCs relative to historical ISM samples taken prior to demolition of buildings in the AOC in 2005. Toluene was detected at one sample location at a low, estimated concentration less than reporting limits. No pesticides or polychlorinated biphenyls (PCBs) were detected or identified as SRCs in surface soil at this AOC.

- Bedrock was encountered at a depth of 3 ft or less across the Building 1200 AOC. Subsurface soil within the former settling pond contains the majority of inorganic SRCs. Within the unconsolidated overburden zone, concentrations of inorganic SRCs decreased with depth. Two SVOCs (fluoranthene and pyrene), one volatile organic compound (VOC) (carbon disulfide), and one propellant (nitrocellulose) were detected only in one subsurface soil sample collected adjacent to former Building 1200. Explosives, pesticides, and PCBs were not detected.

- Sediment occurs in the lower reaches of the drainage ditch to the former settling pond and within the pond. The majority of identified SRCs were detected in the lower reaches of the drainage ditch. The occurrence of inorganic SRCs in sediment was generally sporadic, with the exception of cadmium. Nitrocellulose, lindane, trace concentrations of two SVOCs [benzo(b)fluoranthene and benzo(ghi)perylene], and 2-butanone were detected only in the lower reach of the drainage ditch. No explosives or PCBs were detected in sediment samples.

- Surface water within the drainage ditch and former settling pond is intermittent. Generally, the maximum detected concentration (MDC) of SRCs occurred in the drainage ditch upstream of the former settling pond. Manganese and explosive compounds were identified as SRCs in surface water but not in corresponding sediment samples. A decreasing longitudinal concentration trend was evident for these SRCs, indicating partitioning from surface soil in the former operations area and transport in soluble form during periods of rainfall or snowmelt. Detected SVOCs were primarily phenolic compounds, which were not present in sediment. Detected VOCs were acetone and toluene. The propellant nitroglycerin was detected in one sample. PCBs and pesticides were not detected in the surface water.

ES.3.2 SUMMARY OF CONTAMINANT FATE AND TRANSPORT

Contaminant fate and transport modeling predicts the MDC of hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX) and selenium in surface soil (uppermost reach of the drainage ditch) could leach and migrate to the groundwater table beneath the source at concentrations exceeding its U.S. Environmental Protection Agency (USEPA) Maximum Contaminant Level (MCL), Regional Screening Level (RSL) and RVAAP groundwater facility-wide cleanup goals (FWCUGs) for the National Guard Trainee and Resident Farmer. No chemicals were predicted to migrate to the nearest downgradient groundwater receptor (a tributary to the Mahoning River 4,120 ft to the northeast) at concentrations above USEPA MCL, RSLs, or FWCUGs within the 1,000-year model timeframe. Available groundwater data for the Building 1200 AOC provide validation of modeling results; RDX has never been detected in downgradient monitoring wells since inception of groundwater monitoring in 2004, and selenium has been detected in a downgradient monitoring well but at concentrations less than USEPA MCLs, RSLs, and FWCUGs.

ES.3.3 SUMMARY AND CONCLUSIONS OF THE HUMAN HEALTH RISK ASSESSMENT

An HHRA was performed to identify COCs and provide a risk management evaluation to determine COCs requiring remediation based on potential risks to human receptors. The representative human receptor for the HHRA is the National Guard Trainee based on the Reasonable and Anticipated Future Land Use (RAFLU) for the Building 1200 AOC. The risk assessment also included an evaluation of the Resident Farmer receptor to evaluate an unrestricted land use option. Exposure units (EUs) evaluated in the HHRA were shallow surface soil (0-1 ft bgs), deep surface soil (1-3 ft bgs) for the National Guard Trainee, subsurface soil (1-3 ft bgs) for the Resident Farmer, surface water, and sediment. As noted above, bedrock was encountered at depths of 3 ft or less across the AOC, thereby adjusting the deep surface soil and subsurface soil EUs.

Manganese was identified as a COC in ISM shallow surface soil (0-1 ft bgs) samples for both the National Guard Trainee and Resident Farmer. No COCs were identified in deep surface soil (1-3 ft bgs) samples for the National Guard Trainee or in subsurface soil for the Resident Farmer. No COCs were identified in surface water or sediment samples.

ES.3.4 SUMMARY AND CONCLUSIONS OF THE ECOLOGICAL RISK ASSESSMENT

There is chemical contamination present in soil and sediment at the Building 1200 AOC. This contamination was identified using both historical and PBA08 RI data. Various forest and other ecological resources were observed on the AOC. There are important and significant ecological resources at the AOC. Specifically, a wetland and special interest area are present and near contamination. These findings invoked a requirement of a Level II assessment.

The Level II assessment evaluated soil and sediment COPECs. This assessment identified 14 integrated COPECs for soil [aluminum; cadmium; chromium; cobalt; copper; lead; manganese; mercury; selenium; zinc; 2,4,6-trinitrotoluene (TNT); HMX; nitrocellulose; and RDX] and 5 integrated COPECs for sediment (beryllium, mercury, nitrocellulose, lindane, and acetone). The integrated soil and sediment COPECs were further evaluated with technical and refinement factors in Step 3A. The factors in Step 3A showed that there are no integrated COPECs that are of ecological concern requiring remediation or further evaluation. Consequently, the ERA for the Building 1200 AOC concludes with a Level II Screening Level ERA recommending no further action (NFA) from the ecological perspective.

ES.3.5 RECOMMENDATION OF THE REMEDIAL INVESTIGATION

Based on PBA08 RI results, no further investigation is recommended for the Building 1200 AOC. The RI recommends proceeding to the FS phase to evaluate manganese contamination in shallow surface soil (0-1 ft bgs) at ISM sampling areas B12ss-016M and B12ss-017M that exceeded FWCUGs for National Guard Trainee and Resident Farmer receptors (Figure ES-1). Table ES-1 summarizes the recommended cleanup goals (CUGs) based on the RAFLU and Residential Land Use.

Table ES-1. Chemicals of Concern and Recommended Cleanup Goals

Media	Chemical of Concern	Cleanup Goal (mg/kg)	Location Requiring Remediation (COC Concentration)
National Guard Training Land Use			
Shallow Surface Soil (0-1 ft bgs)	Manganese	1,800	B12ss-016M (4,100 mg/kg)
			B12ss-017M (2,700 mg/kg)
Residential Land Use			
Shallow Surface Soil (0-1 ft bgs)	Manganese	2,927	B12ss-016M (4,100 mg/kg)
			B12ss-017M (2,700 mg/kg)

Cleanup goal (CUG) for unrestricted land use is the lower of the Facility-Wide Cleanup Goals (FWCUGs) for the National Guard Trainee Land Use and the Residential Land Use.
bgs = below ground surface
COC = Chemical of Concern

Analyses of remedial alternatives are not warranted for subsurface soil greater than 1 ft depth, sediment, or surface water based on the absence of human health COCs and results of the ERA and WOE. Soil remediation to protect groundwater resources is not warranted based on contaminant leaching and fate and transport modeling results. NFA is recommended for these media.

ES.4 SUMMARY AND RECOMMENDATION OF THE FEASIBILITY STUDY

The FS develops an RAO, identifies appropriate CUGs for remedial actions, identifies ARARs, screens potential remedial technologies and process options, and develops and evaluates remedial alternatives.

ES.4.1 Remedial Action Objective and Cleanup Goals

The RAO for the Building 1200 AOC is to prevent: (1) National Guard Trainee exposure to COCs above CUGs in soil, sediment, and surface; (2) adverse ecological effects from previous AOC activities; and (3) negative groundwater impacts from contaminant migration from source media (e.g., soil and sediment).

The RAFLU for the Building 1200 AOC is National Guard Training. A Residential Land Use scenario provides a baseline for evaluating whether the AOC may be eligible for unrestricted future use. In either land use scenario, manganese was identified as the only COC for remediation. A precedent surface soil CUG of 1,800 mg/kg exists for manganese and was selected as the CUG for development and evaluation of alternatives consistent with guidelines provided in the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a). The Resident Farmer CUG for manganese is higher than the precedent CUG for the National Guard Trainee. Attainment of the precedent CUG for the National Guard Trainee is, therefore, protective for Residential Land Use and provides the requisite level of protectiveness for unrestricted land use.

ES.4.2 Development and Evaluation of Alternatives

Remedial technologies and process options were screened and the following viable remedial alternatives developed:

- Alternative 1: No Action

- Alternative 2: Attain National Guard Training and Residential Land Uses
  - Shallow Surface Soil (0-1 ft bgs) – Excavation with Off-site Disposal
  - Deep Surface Soil (1-4 ft bgs) – NFA
  - Subsurface Soil (1-13 ft bgs) – NFA
  - Sediment – NFA
  - Surface Water – NFA

The No Action alternative, required for evaluation under the NCP, provides the baseline against which other remedial alternatives are compared. This alternative assumes all current actions (e.g., access restrictions and environmental monitoring) will be discontinued, and assumes no future actions take place to protect human receptors or the environment. Removal or treatment of COCs at the AOC will not be implemented.

Alternative 2 requires removal of shallow surface soil (0-1 ft bgs) exceeding the manganese CUG for the National Guard Trainee and Resident Farmer at sampling locations B12ss-016M and B12ss-017M. Soil would be disposed off-site at an approved, licensed facility. The extent of the excavation is depicted on Figure ES-1, and the estimated total disposal volume (i.e., ex situ) is approximately 75 yd^3. Backfilling and restoration of the excavated area would be conducted in accordance with RVAAP requirements. No land use controls (LUCs) or five-year reviews will be required, as this alternative attains a requisite level of protectiveness for unrestricted use.

The alternatives were compared to CERCLA threshold and balancing criteria, and a comparative analysis was completed to justify the selection of a recommended alternative for Building 1200 AOC soil, sediment, and surface water. Table ES-2 summarizes the comparative analysis of the alternatives.

Table ES-2. Summary of Comparative Analysis of Remedial Alternatives

NCP Evaluation Criteria	Alternative 1: No Action		Alternative 2: Attain National Guard Training and Residential Land Uses	
Threshold Criteria	***Result***		***Result***	
1. Overall Protectiveness of Human Health and the Environment	Not protective		Protective	
2. Compliance with ARARs	Compliant		Compliant	
Balancing Criteria	***Ranking***	***Score***	***Ranking***	***Score***
3. Long-Term Effectiveness and Permanence	Low	1	High	3
4. Reduction of Toxicity, Mobility, or Volume through Treatment	Low	1	Medium	2
5. Short-Term Effectiveness	High	3	Medium	2
6. Implementability	High	3	Medium	2
7. Cost	High	3	Medium	2
Balancing Criteria Score		11		11

ARARs = Applicable or Relevant and Appropriate Requirements
NCP = National Contingency Plan
Scoring for the Balancing Criteria is as follows: High = 3, Medium = 2, Low = 1
High = Highly favorable situation
Medium = Moderately favorable situation
Low = Situation that is not favorable

ES.4.3 Recommended Alternative

The recommended alternative for the Building 1200 AOC is Alternative 2: Attain National Guard Training and Residential Land Uses. Under this alternative, shallow surface soil (0-1 ft bgs) that exceeds the manganese CUG for the National Guard Trainee at locations B12ss-016M and B12ss-017M will be excavated by mechanical equipment and disposed off-site in an approved, licensed facility. Confirmation samples will be collected along excavation sidewalls using ISM to verify the extent of excavation is below the CUG or if further lateral removal of soil is required. If the excavation extends to a previously sampled ISM sampling area that had a concentration less than the CUG (e.g., B12ss-021M), excavation will stop and confirmation sampling on the corresponding sidewall will not be required. The excavated areas will be backfilled with clean soil from an Ohio

EPA-approved off-site source and re-vegetated using Ohio Army National Guard (OHARNG)-approved native seed mixtures and mulched.

Assuming removal beyond the extent of the B12ss-016M and B12ss-017M is not needed, the cost for the alternative is estimated at $123,271. Successful implementation of the alternative will attain a requisite level of protectiveness for soil, sediment, and surface water for unrestricted land use (represented by the National Guard Trainee and Resident Farmer receptors). Therefore, LUCs and five-year reviews will not be required following the remedy.

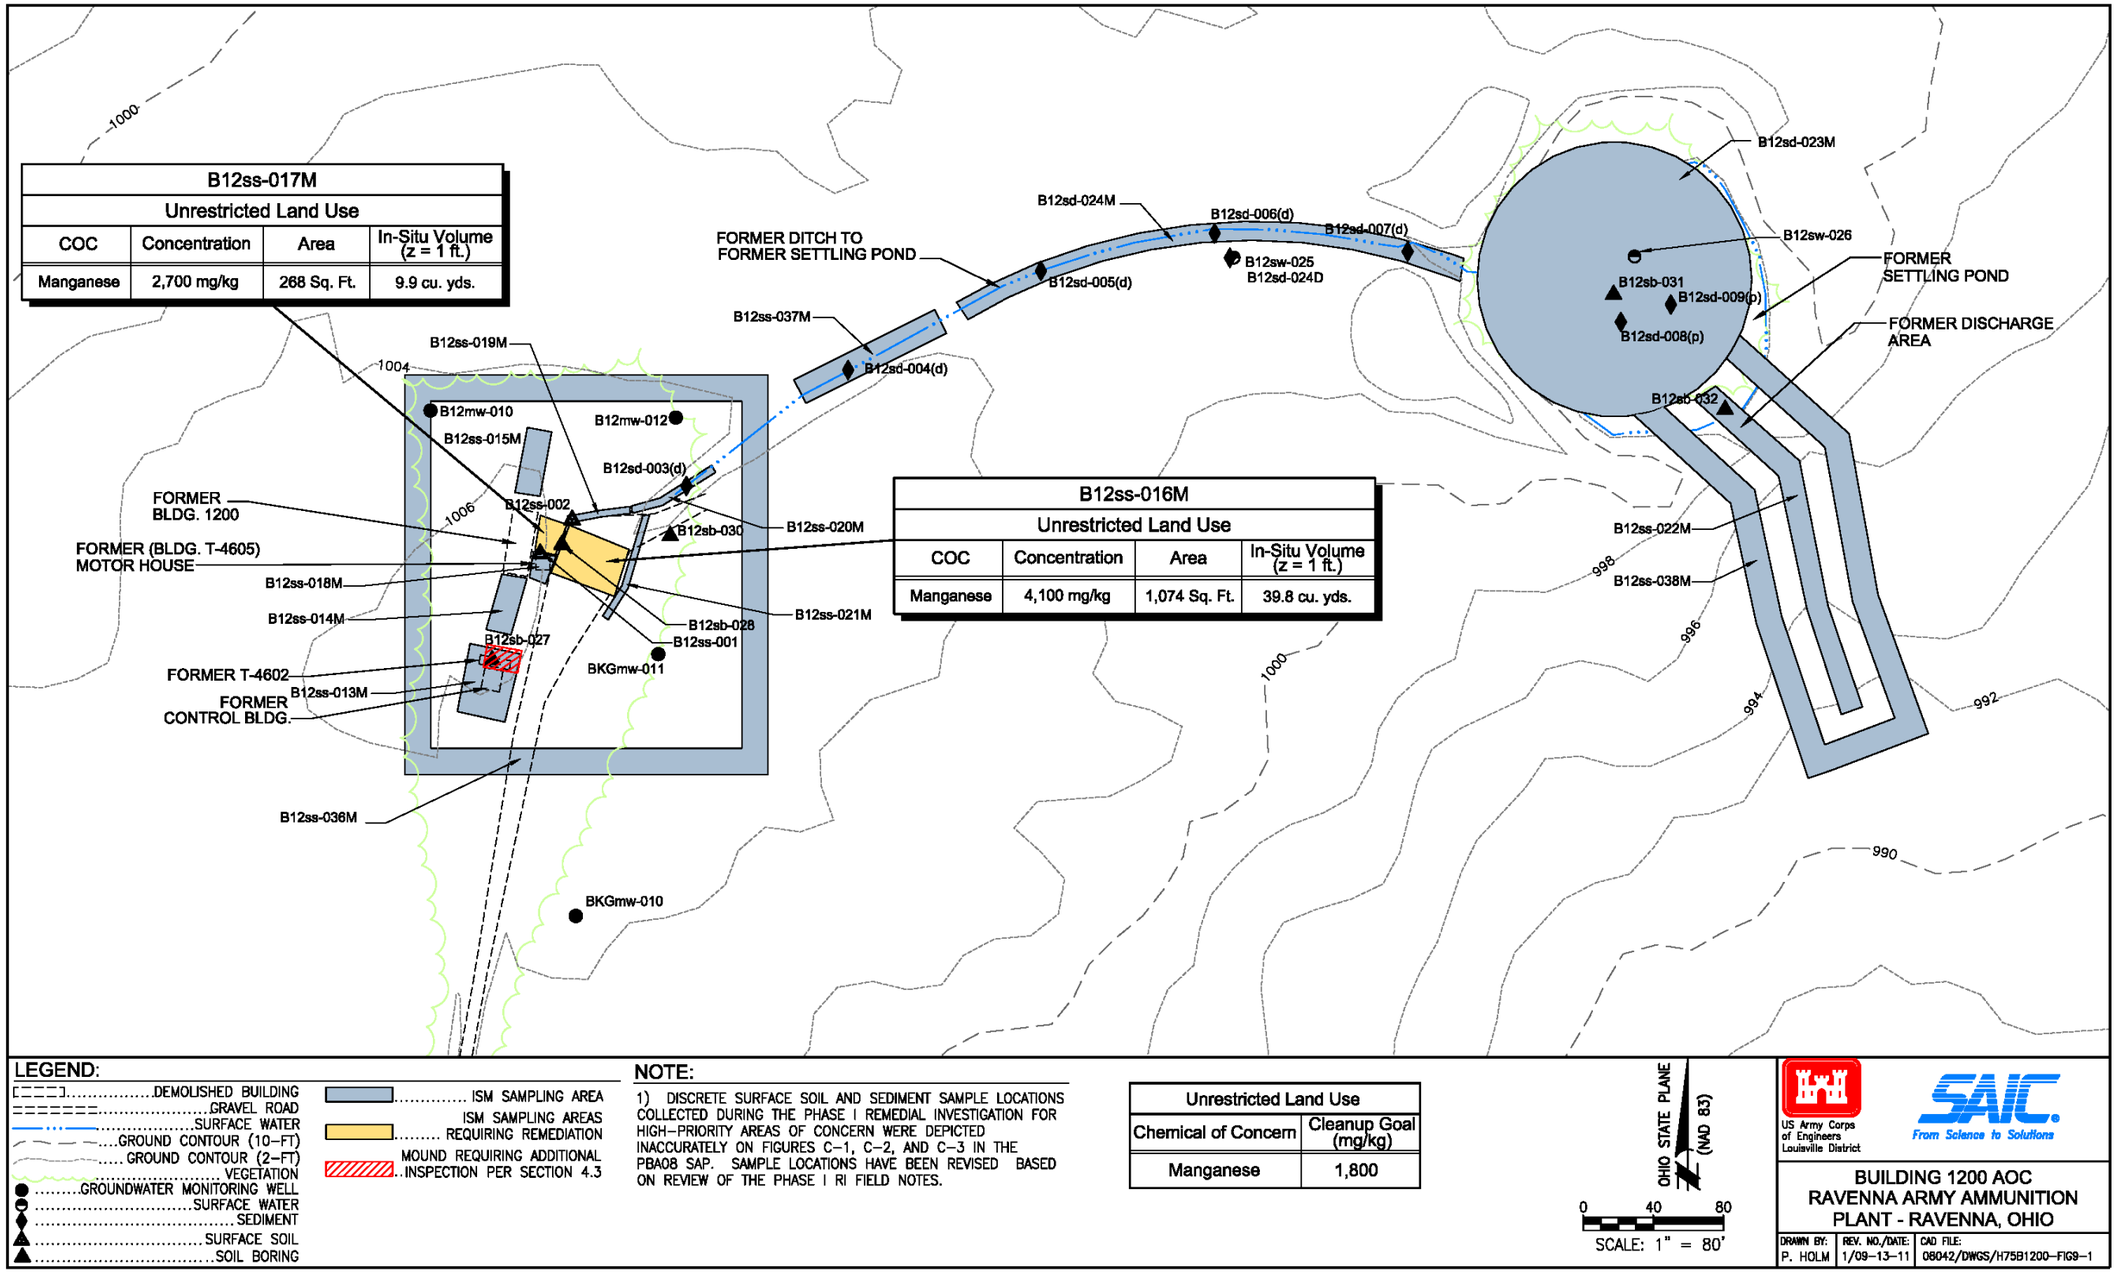

Figure ES-1. Building 1200 AOC Map and Estimated Extent of Surface Soil Excavation Under the Recommended Alternative

THIS PAGE INTENTIONALLY LEFT BLANK.

1.0 INTRODUCTION

Science Application International Corporation (SAIC) has been contracted by the United States Army Corps of Engineers (USACE), Louisville District to provide environmental services to achieve response complete, remedy in place, or site closeout, as documented in an approved Record of Decision (ROD) for the Building 1200 area of concern (AOC) (designated as RVAAP-13) within the Ravenna Army Ammunition Plant (RVAAP) in Ravenna, Ohio (Figures 1-1 and 1-2). This work is being performed in accordance with USACE, Louisville District, Multiple Award Remediation Contract (MARC) W912QR-04-D-0028, Delivery Order No. 0001, under a Performance-Based Acquisition (PBA).

Planning and performance of all elements of this PBA are in accordance with the requirements of the Ohio Environmental Protection Agency (Ohio EPA) *Director's Final Findings and Orders* (DFFO) for RVAAP, dated June 10, 2004 (Ohio EPA 2004). The DFFO requires conformance with Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Contingency Plan (NCP) to implement a remedial investigation (RI) to characterize the AOC, develop a feasibility study (FS) report to present and evaluate remedial alternatives to address contamination presenting unacceptable risk to human health and the environment, present a recommended remedial alternative in a proposed plan (PP), and document stakeholder selection and acceptance of the preferred final remedy in a ROD. Figure 1-3 presents this process.

This document is a combined RI and FS report and includes:

- A description of the operational history and environmental setting for the AOC.
- A summary of the field activities and results of the Performance-Based Acquisition 2008 Remedial Investigation (PBA08 RI) conducted from February 2010 through April 2010 at the AOC.
- A description of the nature and extent of contamination, including the identification of site-related contaminants (SRCs) by screening all eligible data against background concentrations, essential human nutrients, and frequency of detection/weight-of-evidence (WOE) screening.
- An evaluation of contaminant fate and transport by identifying contaminant migration chemicals of potential concern (CMCOPCs) and contaminant migration chemicals of concern (CMCOCs) that may pose a future threat to groundwater.
- A human health risk assessment (HHRA) to identify chemicals of concern (COCs) and an ecological risk assessment (ERA) to identify chemicals of potential ecological concern (COPECs).
- Conclusions of the RI report, including the identification and extent of COCs, which form the basis for conducting the FS.

- Identification of a remedial action objective (RAO) for contaminated media at the AOC.

- Identification of applicable or relevant and appropriate requirements (ARARs).

- Identification of general response actions (GRAs) and screening of a range of remedial technologies to reduce risks to human health and the environment at the AOC from COCs identified in the RI report.

- Development of remedial alternatives from appropriate GRAs and remedial technologies and evaluation of alternatives against criteria specified by CERCLA.

- Conclusions of the FS and a recommended alternative.

Based on the outcome of the evaluation in this RI/FS report, the recommended alternative will be submitted for public review and comment in a PP. Public comments will be considered in the final selection of a remedy, which will be documented in a ROD.

1.1 PURPOSE

The purpose of the PBA08 RI at the Building 1200 AOC is to supplement the data from previous sampling events to delineate the nature and extent of contamination, evaluate contaminant fate and transport, and complete an HHRA and ERA to support remedial decisions. Depending on the results of the RI, a recommendation is provided for either no further action (NFA) or an FS to evaluate potential remedies and future actions. The purpose of the FS is to identify RAOs and appropriate cleanup goals (CUGs) and, subsequently, to screen remedial technologies, develop remedial alternatives to meet the RAO and attain CUGs, and perform a detailed evaluation of remedial alternatives to identify a recommended remedy.

1.2 SCOPE

The scope of this RI/FS report is to present (1) the nature and extent of contamination, fate and transport of contaminants in the environment, and risk assessments for surface soil, subsurface soil, sediment, and surface water; (2) the results of the evaluation of remedial alternatives for meeting the RAO for any COCs identified in these media; and (3) a recommendation for either NFA or a recommended alternative to present to the public in a PP. If remedial actions are warranted, the recommended alternative will achieve required risk reductions to protect human health and the environment and attain all ARARs. In accordance with CERCLA, remedial alternatives are to be cost effective; use permanent solutions and alternative treatment technologies to the maximum extent practicable; and satisfy the preference for treatment that reduces volume, toxicity, or mobility to the maximum practical extent.

For the purposes of this RI/FS report, the term “surface soil” includes dry sediment. Dry sediment refers to unconsolidated inorganic and organic material within conveyances, ditches, or low-lying

areas that occasionally may be covered with water, usually following a precipitation event or due to snowmelt. Dry sediment is not covered with water for extended periods, and typically is dry within seven days of a precipitation event. Dry sediment does not function as permanent habitat for aquatic organisms, although it may serve as a natural medium for the growth of terrestrial organisms. Dry sediment is addressed the same as surface soil [0-1 ft below ground surface (bgs)] in terms of contaminant nature and extent, fate and transport, and risk exposure models. The term "sediment," as used in this RI/FS report, refers to wet sediment within conveyances, ditches, wetlands, or water bodies that is inundated for extended periods of time. These definitions and terminology usage are consistent with the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a) (herein referred to as the FWCUG Report).

Potential impacts to groundwater from soil and sediment media (e.g., contaminant leaching) are evaluated in this report, as protectiveness to groundwater is included in the evaluation of remedial alternatives for these media. However, potential groundwater remedies, if required, will be assessed in a separate report. Buildings and structures at the Building 1200 AOC have been demolished; therefore, they are not evaluated as continuing sources of contamination in the RI/FS report.

1.3 REPORT ORGANIZATION

This RI/FS report is organized to in accordance with Ohio EPA and U.S. Environmental Protection Agency (USEPA) CERCLA RI/FS guidance, as well as applicable USACE guidance. Below is a summary the components of the report and appendices:

- Section 2.0 provides a description and history of RVAAP and the Building 1200 AOC operational area.

- Section 3.0 describes the environmental setting at RVAAP and the Building 1200 AOC, including the geology, hydrogeology, climate, population, and ecological resources.

- Section 4.0 describes the specific RI methods used for field data collection for the PBA08 RI and the approach to analytical data management and laboratory programs.

- Section 5.0 presents the data generated during the PBA08 RI and discusses the occurrence and distribution of contamination at the Building 1200 AOC.

- Section 6.0 presents and evaluation of contaminant fate and transport.

- Section 7.0 includes the methods and results of the HHRA and ERA.

- Section 8.0 provides the conclusions and recommendations of the RI.

- Section 9.0 outlines the development of the RAO for the chemicals and media of concern.

- Section 10.0 summarizes potential federal and state chemical-, location-, and action-specific ARARs for the potential remedial actions.

- Section 11.0 presents GRAs and the identification and screening of technology types and process options considered for possible use in remediation.

- Section 12.0 develops remedial alternatives from technologies and process options that passed initial screening and presents an initial evaluation against effectiveness, implementability, and cost.

- Section 13.0 presents the detailed and comparative analyses of viable remedial action alternatives developed to address chemicals and media of concern using the seven criteria specified by USEPA CERCLA guidance.

- Section 14.0 summarizes the framework for conducting the necessary agency and public involvement activities.

- Section 15.0 presents the conclusions of the FS and the recommended remedial alternative.

- Section 16.0 provides a list of references used to develop this report.

- Appendices:
  Appendix A: Field Sampling Logs;
  Appendix B: Project Quality Assurance Summary;
  Appendix C: Data Quality Control Summary Report;
  Appendix D: Laboratory Analytical Results and Chains-of-Custody;
  Appendix E: Fate and Transport Modeling Results;
  Appendix F: Investigation-derived Waste Management Reports;
  Appendix G: Human Health Risk Assessment Tables;
  Appendix H: Ecological Risk Assessment Information and Data; and
  Appendix I: Detailed Cost Estimates.

2.0 BACKGROUND

2.1 FACILITY-WIDE BACKGROUND INFORMATION

2.1.1 General Facility Description

When the RVAAP Installation Restoration Program (IRP) began in 1989, RVAAP was identified as a 21,419-acre facility. The property boundary was resurveyed by Ohio Army National Guard (OHARNG) over a 2-year period (2002 and 2003) and the total acreage of the property was found to be 21,683 acres. As of June 2010, a total of 20,423 acres of the former 21,683-acre RVAAP have been transferred to the National Guard Bureau (NGB) and subsequently licensed to OHARNG for use as a military training site.

The current RVAAP consists of 1,260 acres scattered throughout the OHARNG Camp Ravenna Joint Military Training Center, herein referred to as Camp Ravenna. Camp Ravenna is in northeastern Ohio within Portage and Trumbull counties, approximately 3 miles east-northeast of the city of Ravenna and approximately 1 mile northwest of the city of Newton Falls. The RVAAP portions of the property are located solely within Portage County. RVAAP and Camp Ravenna occupy a parcel of property approximately 11 miles long and 3.5 miles wide bounded by State Route 5, the Michael J. Kirwan Reservoir, and the CSX System Railroad on the south; Garrett, McCormick, and Berry roads on the west; the Norfolk Southern Railroad on the north; and State Route 534 on the east (Figures 1-1 and 1-2). Camp Ravenna is surrounded by several communities: Windham on the north, Garrettsville 6 miles to the northwest, Newton Falls 1 mile to the southeast, Charlestown to the southwest, and Wayland 3 miles to the south.

When RVAAP was operational, Camp Ravenna did not exist and the entire 21,683-acre parcel was a government-owned, contractor-operated, industrial facility. The RVAAP IRP encompasses investigation and cleanup of past activities over the entire 21,683 acres of the former RVAAP. References to RVAAP in this document indicate the historical extent of RVAAP, which is inclusive of the combined acreages of the current Camp Ravenna and RVAAP, unless otherwise specifically stated.

Former industrial operations at RVAAP consisted of 12 munitions-assembly facilities referred to as "load lines." Load Lines 1 through 4 were used to melt and load 2,4,6-trinitrotoluene (TNT) and Composition B into large-caliber shells and bombs. The operations on the load lines produced explosive dust, spills, and vapors that collected on the floors and walls of each building. Periodically, the floors and walls were cleaned with water and steam. Following cleaning, the wastewater, containing TNT and Composition B, was known as "pink water" for its characteristic color. Pink water was collected in concrete holding tanks, filtered, and pumped into unlined ditches for transport to earthen settling ponds. Load Lines 5 through 11 were used to manufacture fuzes, primers, and boosters. Potential contaminants in these load lines include lead compounds, mercury compounds, and explosives. From 1946 to 1949, Load Line 12 was used to produce ammonium nitrate for explosives and fertilizers prior to use as a weapons demilitarization facility.

In 1950, the facility was placed on standby status and operations were limited to renovation, demilitarization, and normal maintenance of equipment, along with storage of munitions. Production activities were resumed from July 1954 to October 1957 and again from May 1968 to August 1972. In addition to production missions, various demilitarization activities were conducted at facilities constructed at Load Lines 1, 2, 3, and 12. Demilitarization activities included disassembly of munitions and explosives melt-out and recovery operations using hot water and steam processes. Periodic demilitarization of various munitions continued through 1992.

In addition to production and demilitarization activities at the load lines, other facilities at RVAAP include AOCs that were used for the burning, demolition, and testing of munitions. These burning and demolition grounds consist of large parcels of open space or abandoned quarries. Potential contaminants at these AOCs include explosives, propellants, inorganic chemicals, and waste oils. Other types of AOCs present at RVAAP include landfills, an aircraft fuel tank testing facility, and various general industrial support and maintenance facilities.

2.1.2 Demography and Land Use

RVAAP consists of 21,683 acres and is located in northeastern Ohio, approximately 23 miles east–northeast of Akron and 30 miles west–northwest of Youngstown. RVAAP occupies east–central Portage County and southwestern Trumbull County. Census projections for 2010 indicate the populations of Portage and Trumbull counties are 161,419 and 210,312, respectively. Population centers closest to RVAAP are Ravenna, with a population of 11,724, and Newton Falls, with a population of 4,795.

The RVAAP facility is located in a rural area, and is not close to any major industrial or developed areas. Approximately 55% of Portage County, in which the majority of RVAAP is located, consists of either woodland or farmland acreage. The closest major recreational area, the Michael J. Kirwan Reservoir (also known as West Branch Reservoir), is located adjacent to the western half of RVAAP south of State Route 5.

RVAAP is operated by the Base Realignment and Closure (BRAC) Division of the Army who manages the restoration activities at RVAAP. Camp Ravenna (which is located on the remainder of the property) is owned by NGB who licenses it to the OHARNG for use as a military training site. Training and related activities at Camp Ravenna include field operations and bivouac training, convoy training, equipment maintenance, C-130 aircraft drop zone operations, helicopter operations, and storage of heavy equipment.

2.2 BUILDING 1200 AOC BACKGROUND INFORMATION

2.2.1 Operational History

The Building 1200 AOC was designated as the Ammunition Sectioning Area (Figure 2-1). From 1941 to 1971, the AOC was used for ammunition demilitarization, which consisted of disassembly and removal of explosive charges using steam to melt-out the explosives. The primary operations building was Building 1200, which was a 30 ft by 20 ft combined reinforced concrete and transite panel frame structure. The steam melt-out process generated explosives-contaminated wastewater (pink water), which discharged from the building via a pipe, through a crushed slag gravel bed, and into a ditch connected to a 0.5-acre, unlined settling pond (located approximated 415 ft northeast of Building 1200). The depth of the settling pond is less than 3 ft. Overflow from the settling pond discharged directly to the ground surface southeast of the pond; there is no documented evidence of a discharge drainage ditch exiting the settling pond and flowing to a surface water body.

2.2.2 Building Demolitions

Building demolition activities occurred at the Building 1200 AOC between November 2004 and August 2005. These demolition activities took place along with building demolition at Load Line 11 and Building F-15. Demolition activities at the Building 1200 AOC included the complete removal of the buildings, floor slabs, and footers of Building 1200 (530 sq ft), Building T-4605 (69 sq ft), and Building T-4602 (117 sq ft) (MKM 2005).

Paint on the interior of each building was sampled to determine regulatory status of the applied dry paints. The paint sampling was performed in accordance with a USEPA and Ohio EPA-approved sampling and analysis plan (SAP). Sample results showed the polychlorinated biphenyl (PCB) concentrations in the applied paint at the buildings within the Building 1200 AOC were less than 50 parts per million (ppm), which is the concentration that indicates a waste may be disposed of in a Toxic Substances Control Act (TSCA) incinerator, in a TSCA chemical waste landfill, or by an EPA-approved alternative method.

Additionally, 63,343 ft^2 of transite roofing and 3,341 ft^2 of tar/shingle roofing material were removed from Load Line 11, Building 1200, Building T-4605, and Building T-4602. All asbestos removal operations were performed by a state of Ohio licensed asbestos removal contractor. All asbestos-containing material (ACM) was disposed off-site in accordance with federal, state, and local rules laws and regulations.

Following building demolition activities, the former building footprints were re-graded, seeded, and mulched to match pre-existing AOC conditions. Surface and subsurface soil adjacent to the former building structures were disturbed during removal activities. Remnant infrastructure consists only of a drainage ditch, former settling pond, and discharge area from the former settling pond. None of these areas were backfilled or re-graded during demolition activities. The area immediately surrounding the AOC is forested with the exception of the access road (Ammunition Sectioning

Road), a small sparsely vegetated area around the former building footprints, and the former settling pond located approximately 415 ft northeast of the former building footprints.

2.2.3 Previous Investigations

Since 1989, the Building 1200 AOC has been included in various assessments and investigations conducted at RVAAP including:

- Resource Conservation and Recovery Act (RCRA) Facility Assessment (Jacobs 1989);
- Preliminary Assessment for the Characterization of Areas of Contamination (USACE 1996);
- Phase I Remedial Investigation of High-Priority Areas of Concern (USACE 1998); and
- Characterization of 14 AOCs at the Ravenna Army Ammunition Plant (MKM 2007).

The following subsections describe these assessments and investigations.

2.2.3.1 Ravenna Army Ammunition Plant RCRA Facility Assessment

Jacobs Engineering Group performed a RCRA Facility Assessment in 1989, as documented in the *Ravenna Army Ammunition Plant RCRA Facility Assessment* (Jacobs 1989). The RCRA Facility Assessment performed a visual inspection of known AOCs and identified new AOCs and solid waste management units. From this inspection, the Building 1200 AOC showed a high potential for release of contamination to groundwater, surface water, and soil. The following sample types were recommended for analysis of inorganic chemicals and explosives:

- Soil samples from the drainage ditch to the former settling pond;
- Sediment samples from the former settling pond; and
- Surface water samples from the former settling pond.

2.2.3.2 Preliminary Assessment for the Characterization of Areas of Contamination

In 1996, USACE completed the *Preliminary Assessment for the Characterization of Areas of Contamination* (USACE 1996), which provided facility history, process operations, and activities conducted at 38 identified AOCs in RVAAP with known or suspect environmental concerns. The identified AOCs were prioritized for CERCLA action using a Relative Risk Site Evaluation (RRSE) that was based on an analytical hierarchy process score that evaluated potential threat to human health and the environment (e.g., potential hazards, release mechanisms, and environmental conditions). Of the 38 identified AOCs, ten AOCs, including the Building 1200 and dilution/settling pond (i.e., the Building 1200 AOC), were categorized as high-priority warranting further action. The Preliminary Assessment identified the following potential contaminants and release mechanisms associated with former operations at the Building 1200 AOC:

- Potential contaminants identified were explosives [e.g., TNT; hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX); octahydro-1,3,5,7-tetranitro-1,3,5,7-tetrazocine (HMX); composition B; and lead azide] and heavy metals (lead and mercury).

- The primary release mechanism for contamination at the Building 1200 AOC was identified as wastewater effluent from munitions disassembly and demilitarization processes.

2.2.3.3 Phase I Remedial Investigation for High-Priority Areas of Concern

From July to August of 1996, USACE conducted a Phase I Remedial Investigation for High-Priority Areas of Concern, which included the Building 1200 AOC (USACE 1998). Two surface soil and seven sediment samples were collected at the Building 1200 AOC from soil adjacent to the former process building, sediment within in the drainage ditch to the former settling pond, and sediment within the former settling pond. Based on RVAAP standardized definitions of wet and dry sediment, five of the seven sediment samples were subsequently classified as surface soil in the Ravenna Environmental Information Management System (REIMS) database. All surface soil and sediment samples were analyzed for USEPA Target Analyte List (TAL)/Total Compound List (TCL) inorganic chemicals, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, PCBs, cyanide, and explosives.

The findings of this investigation concluded the Building 1200 AOC was "medium" priority because no widespread contamination was detected in the soil, explosives were not detected in the soil, and polycyclic aromatic hydrocarbons (PAHs) were detected in only one soil sample. Low concentrations of explosives were detected in the drainage ditch and former settling pond. The *Phase I Remedial Investigation Report for High-Priority Areas of Concern* (USACE 1998) concluded there were two chemicals of potential concern (COPCs) identified in soil [beryllium (at background concentrations) and benzo(a)pyrene].

2.2.3.4 Characterization of 14 Areas of Concern

The following field activities were conducted in 2004 at the Building 1200 AOC as part of the Characterization of 14 AOCs [as documented in *Characterization of 14 AOCs at the Ravenna Army Ammunition Plant* (MKM 2007)] to assess the potential impacts from former operations:

- Collection of 10 incremental sampling methodology (ISM) surface soil (0-1 ft) samples;

- Excavation of one test trench;

- Collection of two ISM sediment (0 to 0.5 ft) samples from the drainage ditch leading to the former settling pond;

- Collection of two surface water samples from drainage pathways;

- Installation, development, and sampling of three bedrock groundwater monitoring wells;
- Collection of a geotechnical sample from one soil boring during monitoring well installation;
- Conduction of in-situ permeability testing (slug tests); and
- Survey of AOC sampling and monitoring well locations.

The Characterization of 14 AOCs report utilizes the term "multi-increment®" or "MI" sample. This sampling technique is currently referred to as "ISM." All surface soil and sediment samples were analyzed for TAL metals and explosives. In addition, one soil sample was analyzed for VOCs, SVOCs, propellants, pesticides, and PCBs. Sediment samples were also analyzed for total organic carbon (TOC) and grain size. Groundwater and surface water samples were analyzed for TAL metals, explosives, propellants, VOCs, SVOCs, pesticides, and PCBs.

During test trench excavation, bedrock was encountered at approximately 3.5 ft bgs. No munitions and explosives of concern (MEC) were encountered during trenching activities. Data from monitoring wells installed during the characterization effort showed the depth to the groundwater table was between 12 and 20 ft bgs.

A human health risk screening (HHRS) and an ecological risk screening (ERS) for the Building 1200 AOC were included in the Characterization of 14 AOCs. The HHRS compared chemical concentrations detected in the Building 1200 AOC samples to RVAAP criteria in effect at that time, which included facility-wide background concentrations for inorganic chemicals and USEPA Region 9 residential Preliminary Remediation Goals (PRGs). The results of the HHRS identified contaminants above screening criteria in surface soil, sediment, surface water, and groundwater at the Building 1200 AOC, as summarized in Table 2-1.

Table 2-1. Chemicals of Potential Concern per the Characterization of 14 AOCs Report

Surface Soil	Sediment	Surface Water	Groundwater
Aluminum Chromium Iron Manganese Benzo(ghi)perylene RDX Nitrocellulose	Aluminum Benzo(ghi)perylene Nitrocellulose	Manganese RDX Nitrocellulose	Arsenic

Source: *Characterization of 14 AOCs* (MKM 2007)
AOC = Area of Concern
RDX = hexahydro-1,3,5-trinitro-1,3,5-triazine

The ERS compared chemical concentrations detected in the Building 1200 AOC media to RVAAP facility-wide background concentrations for inorganic chemicals and ecological screening values (ESVs). The ERS followed screening methodology guidance presented in the *2003 RVAAP Facility-Wide Ecological Risk Work Plan* (USACE 2003c) (herein referred to as the FWERWP) and *Guidance*

for Conducting Ecological Risk Assessments (Ohio EPA 2003). Constituents were retained if they did not have screening values. Table 2-2 presents those chemicals identified in the ERS as exceeding screening values for the Building 1200 AOC.

Table 2-2. Chemicals Exceeding ESVs per the Characterization of 14 AOCs Report

Surface Soil		Sediment	Surface Water	Groundwater
Aluminum	Mercury	Beryllium	Iron	Not evaluated
Barium	Selenium	Mercury	Manganese	
Chromium	Zinc	Gamma-BHC	Mercury	
Copper	TNT	Acetone	Acetone	
Iron	HMX	Nitrocellulose	Benzoic Acid	
Lead	RDX		Benzenemethanol	
Manganese	Nitrocellulose			

Source: *Characterization of 14 AOCs* (MKM 2007)
AOC = Area of Concern
ESV = Ecological Screening Value
HMX = octahydro-1,3,5,7-tetranitro-1,3,5,7-tetrazocine
RVAAP = Ravenna Army Ammunition Plant
RDX = hexahydro-1,3,5-trinitro-1,3,5-triazine
TNT = 2,4,6-trinitrotoluene
Gamma-BHC = lindane

The Characterization of 14 AOCs recommended a full risk assessment should be considered to assist in the overall risk management decisions for the Building 1200 AOC.

THIS PAGE INTENTIONALLY LEFT BLANK.

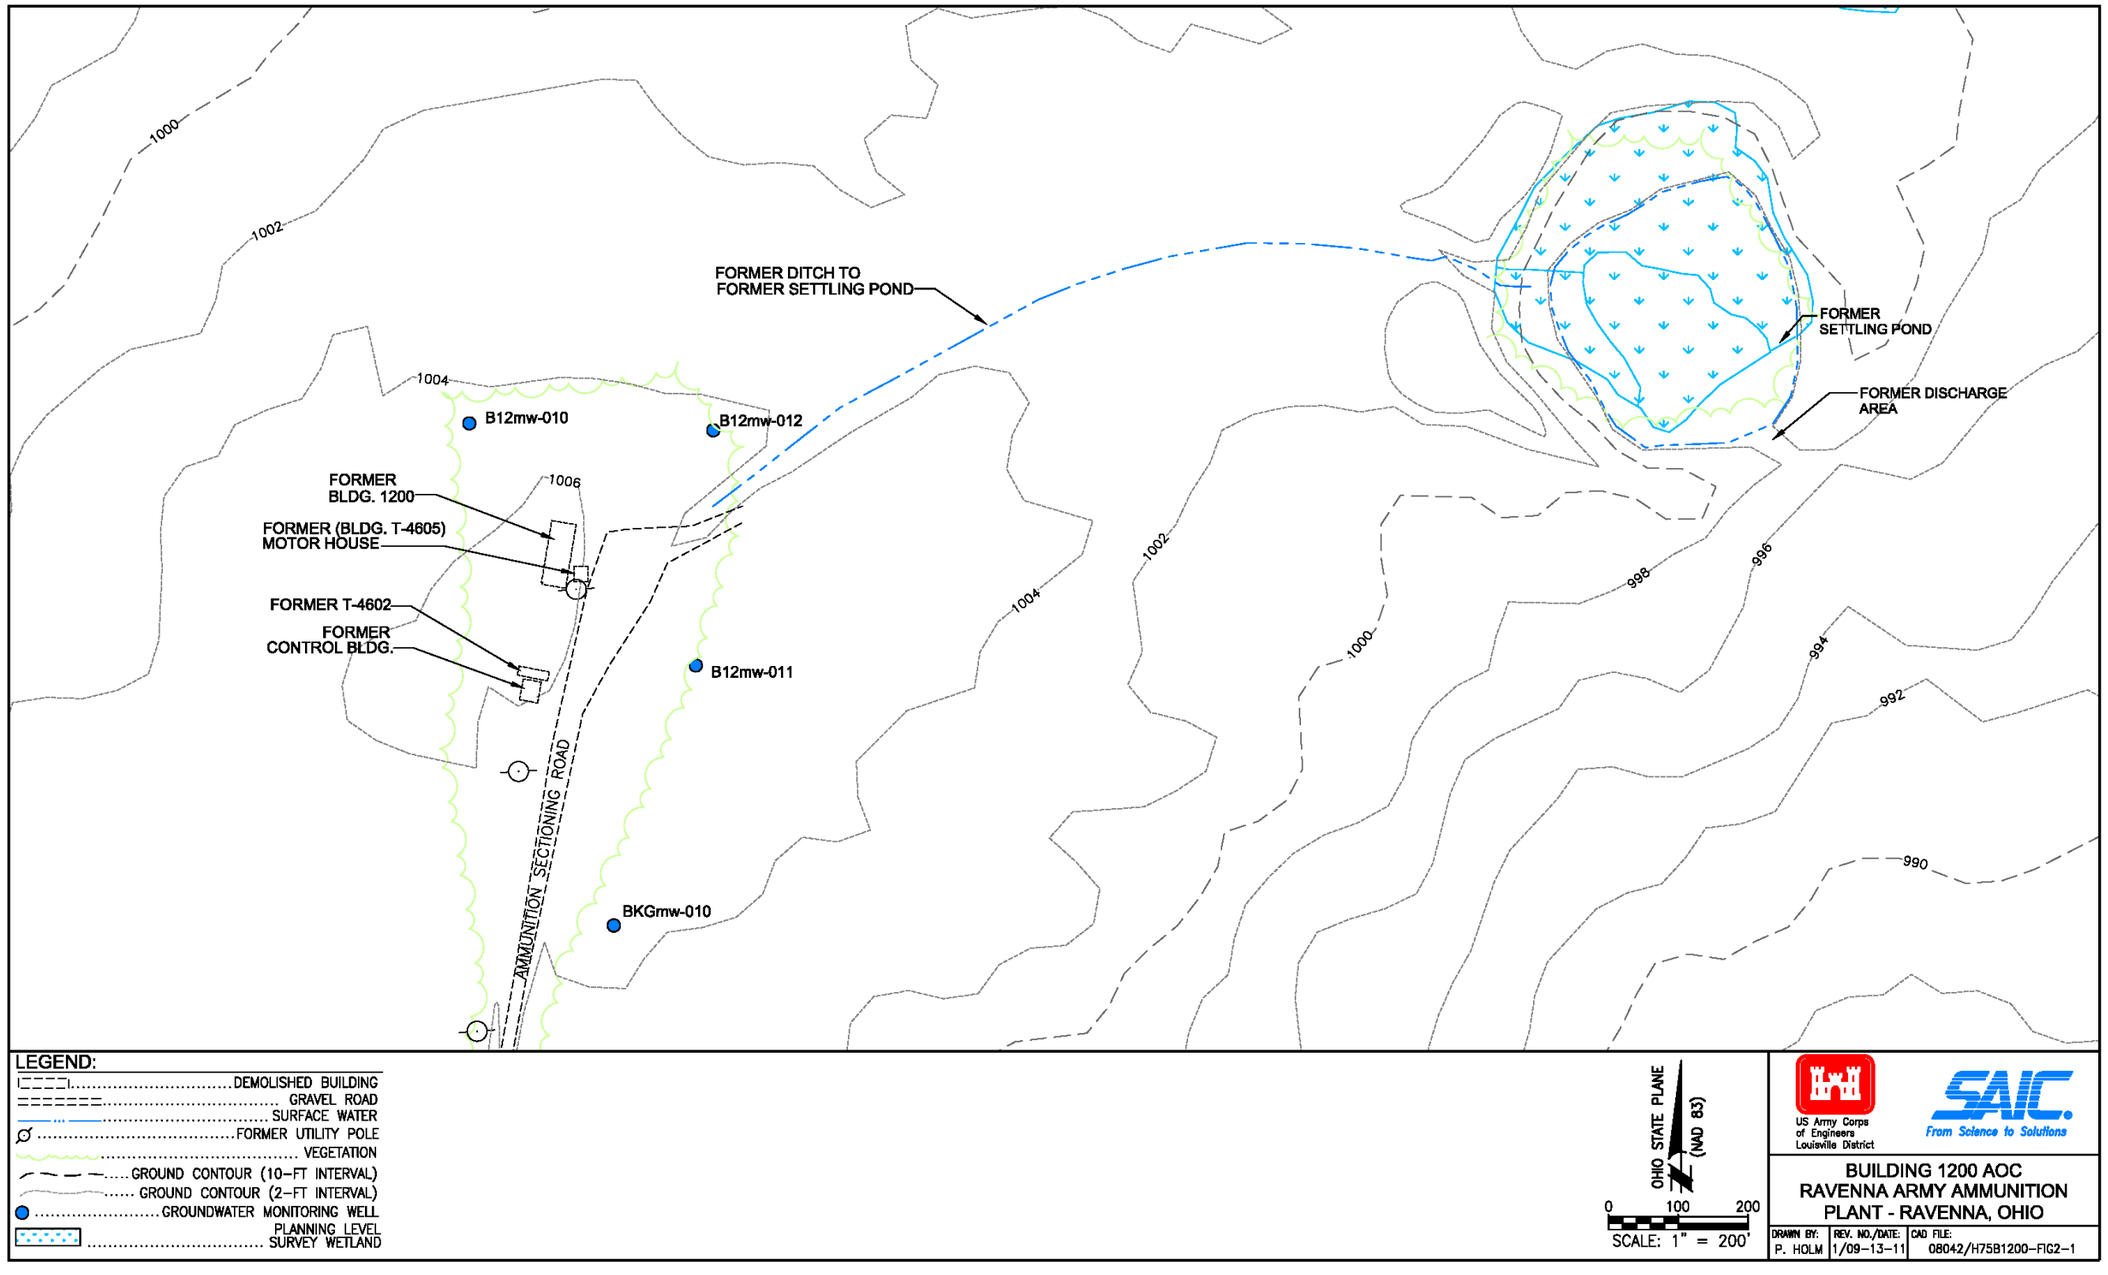

Figure 2-1. Building 1200 AOC Map and AOC Features

THIS PAGE INTENTIONALLY LEFT BLANK.

3.0 ENVIRONMENTAL SETTING

This section describes the physical characteristics of RVAAP and the Building 1200 AOC that are factors in identifying the potential contaminant transport pathways, receptor populations, and exposure scenarios with respect to the evaluation of human health and ecological risks. This section also presents a preliminary conceptual site model (CSM) based on AOC characteristics and historical investigation data to provide a framework for evaluating contaminant nature and extent, fate and transport, and human health and ecological risk. An updated CSM is presented in Section 8.0 to integrate the results of evaluations performed in this report.

3.1 RVAAP PHYSIOGRAPHIC SETTING

RVAAP is located within the Southern New York Section of the Appalachian Plateaus physiographic province (USGS 1968). This province is characterized by elevated uplands underlain primarily by Mississippian and Pennsylvanian age bedrock units that are horizontal or gently dipping. The province is characterized by rolling topography with incised streams having dendritic drainage patterns. The Southern New York Section has been modified by glaciation, which rounded ridges, filled major valleys, and blanketed many areas with glacially-derived, unconsolidated deposits (i.e., sand, gravel, and finer grained outwash deposits). As a result of glacial activity in this section, old stream drainage patterns were disrupted in many locales, and extensive wetland areas developed.

3.2 SURFACE FEATURES AND AOC TOPOGRAPHY

The topography of RVAAP is gently undulating with an overall decrease in ground elevation from a topographic high of approximately 1220 ft above mean sea level (amsl) in the far western portion of the facility to low areas at approximately 930 ft amsl in the far eastern portion of the facility.

USACE mapped the facility topography in February 1998 using a 2-ft (60.1-cm) contour interval with an accuracy of 0.02 ft (0.61 cm). USACE based the topographic information on aerial photographs taken during the spring of 1997. The USACE survey is the basis for the topographical information illustrated in figures found in this report.

The topography at the Building 1200 AOC gently slopes radially from a high point just southwest of the former operations buildings. Ground elevations at the AOC range from 990 ft amsl to 1004 ft amsl (Figure 3-1). Storm water runoff from former operational areas within the AOC generally follows topography and eventually exits the AOC to the south. The closest surface water, a tributary of Sand Creek, is located approximately 1000 ft south of the former settling pond. The remaining surface features include the access road, drainage ditch from the former operations area to the former settling pond, and the former settling pond and associated discharge area.

3.3 SOIL AND GEOLOGY

3.3.1 Regional Geology

The regional geology at RVAAP consists of horizontal to gently dipping bedrock strata of Mississippian and Pennsylvanian age overlain by varying thicknesses of unconsolidated glacial deposits. The bedrock and unconsolidated geology at RVAAP and geology specific to the Building 1200 AOC are presented in the following subsections.

3.3.2 Soil and Glacial Deposits

Bedrock at RVAAP is overlain by deposits of the Wisconsin-aged Lavery Till in the western portion of the facility and the younger Hiram Till and associated outwash deposits in the eastern two-thirds of the facility (Figure 3-2). Unconsolidated glacial deposits vary considerably in character and thickness across RVAAP, from zero in some of the eastern portions of the facility to an estimated 150 ft in the south-central portion.

Thin coverings of glacial material have been completely removed as a consequence of human activities at locations such as Ramsdell Quarry. Bedrock is present at or near the ground surface in locations such as at Load Line 1 and the Erie Burning Grounds (USACE 2001a). Where this glacial material is still present, its distribution and character indicate their origin as ground moraine. These tills consist of laterally discontinuous assemblages of yellow-brown, brown, and gray silty clays to clayey silts with sand and rock fragments. Lacustrine sediment from bodies of glacial-age standing water also has been encountered in the form of deposits of uniform light gray silt greater than 50-ft thick in some areas (USACE 2001a).

Soil at RVAAP is generally derived from the Wisconsin-age silty clay glacial till. Distributions of soil types are discussed and mapped in the *Soil Survey of Portage County, Ohio*, which describes soil as nearly level to gently sloping and poor to moderately well drained (USDA 1978). Much of the native soil at RVAAP was disturbed during construction activities in former production and operational areas of the facility.

The Sharon Member of the Pennsylvanian Pottsville Formation is the primary bedrock beneath RVAAP. In the western half of the facility, the upper members of the Pottsville Formation, including the Connoquenessing Sandstone (also known as the Massillon Sandstone), Mercer Shale, and uppermost Homewood Sandstone have been found. The regional dip of the Pottsville Formation measured in the west portion of RVAAP is between 5-11.5 ft per mile to the south.

3.3.3 Geologic Setting of the Building 1200 AOC

The Building 1200 AOC is on a local bedrock high. The Building 1200 AOC is underlain by a thin unconsolidated interval generally less than 3 ft thick. The underlying bedrock formation observed at the Building 1200 AOC is the Pennsylvanian age Pottsville Formation, Sharon Sandstone Member

(Figure 3-3). The sandstone unit of the Sharon member (informally referred to as the Sharon Conglomerate) is a highly porous, loosely cemented, permeable, cross-bedded, frequently fractured and weathered orthoquartzite sandstone, which is locally conglomeritic. The Sharon Conglomerate exhibits locally occurring thin shale lenses in the upper portion of the unit. Upper members of the Pottsville Formation are not present at the AOC.

During the PBA08 RI, bedrock was encountered at depths ranging from 1.8 ft bgs in the center of the settling pond to 3 ft bgs in the former building footprint. Monitoring well installation conducted during the Characterization of 14 AOCs encountered bedrock at 2-4 ft bgs.

Two soil types found at this AOC include the Mahoning silt loam (MgB), 2 to 6% slopes, and Mitiwanga silt loam (MtB), 2 to 6% slopes. Mahoning silt loam is a gently sloping, poorly drained soil formed in silty clay loam or clay loam glacial till, generally where bedrock is greater than 6 ft bgs. The Mahoning silt loam is present in the northeastern part of the AOC in the area of the former settling pond. The Mahoning silt loam has low permeability with rapid runoff and seasonal wetness. Permeability ranges from 1.52 to 5.08 cm/hour. Mitiwanga silt loam is a gently sloping, moderately well drained soil formed from glacial till over weathered sandstone and exists in the area of former buildings in the southern portion of the AOC. The soil has a moderate permeability of 1.52 to 5.08 cm/hour and is seasonally wet (USACE 2010a).

Lithologic logs from three monitoring well borings, advanced to a maximum depth of 24 ft bgs during the Characterization of 14 AOCs, characterize the surface and subsurface geology at the Building 1200 AOC as:

- Soil consisting of clay to sand-rich silt tills with interbedded sand and weathered sandstone scattered throughout from 0 ft bgs to approximately 4 ft bgs. These deposits are generally firm, moderately plastic, and tend to hold water.

- Fine-grained sandstone with thin interbedded shale ranges from approximately 3-24 ft bgs.

Geologic descriptions and geotechnical analyses of subsurface soil samples collected during the PBA08 RI are generally consistent with the conclusions from the Characterization of 14 AOCs. Overall, the PBA08 RI observed silty clay till above sandstone encountered at a maximum depth of 3 ft bgs. Groundwater was not observed in unconsolidated borings. PBA08 RI boring logs containing geologic descriptions of unconsolidated deposits at the Building 1200 AOC are included in Appendix A.

Geotechnical analysis conducted during the Characterization of 14 AOCs indicated a grain size distribution of 68% silt and clay fractions, 31% sand fractions, and 1% aggregate. The geotechnical sample collected from 0-2 ft bgs was characterized as brown sandy lean clay (MKM 2007). One geotechnical sample was collected as part of the PBA08 RI from 0.5-2.5 ft bgs. Analysis of the undisturbed geotechnical samples (Shelby tube) indicates 16% sand, 42% silt, and 42% clay fractions.

Geotechnical analysis further indicted a porosity of 37.5% and a permeability of 8.2E-06 cm/sec for this sample. A summary of the PBA08 RI geotechnical analysis is presented in Section 5.2.4.

3.4 HYDROGEOLOGY

3.4.1 Regional Hydrogeology

Sand and gravel aquifers are present in the buried-valley and outwash deposits in Portage County as described in the *Phase I Remedial Investigation Report for High-Priority Areas of Concern* (USACE 1998). Generally, these saturated zones are too thin and localized to provide large quantities of water for industrial or public water supplies; however, yields are sufficient for residential water supplies. Lateral continuity of these aquifers is unknown. Recharge of these units is derived from surface water infiltration of precipitation and surface streams. Specific groundwater recharge and discharge areas at RVAAP have not been delineated.

The thickness of the unconsolidated interval at RVAAP ranges from thin to absent in the eastern and northeastern portion of the facility, to an estimated 150 ft in central portion of the facility. The groundwater table occurs within the unconsolidated zone in many areas of the facility. Because of the heterogeneous nature of the unconsolidated glacial material, groundwater flow patterns are difficult to determine with a high degree of accuracy. Vertical recharge from precipitation likely occurs via infiltration along root zones, desiccation cracks, and partings within the soil column. Laterally, most groundwater flow likely follows topographic contours and stream drainage patterns, with preferential flow along pathways (e.g., sand seams, channel deposits, or other stratigraphic discontinuities) having higher permeabilities than surrounding clay or silt-rich material. Figure 3-4 illustrates facility-wide potentiometric surface data in the unconsolidated interval for the most recent available contemporaneous measurement event in January 2010 (EQM 2010).

Within bedrock units at RVAAP, the principle water-bearing aquifer is the Sharon Sandstone/Conglomerate. Depending on the existence and depth of overburden, the Sharon Sandstone/Conglomerate ranges from an unconfined to a leaky artesian aquifer. Water yields from on-site water supply wells completed in the Sharon Sandstone/Conglomerate ranged from 30-400 gallons per minute (gpm) (USATHAMA 1978). Well yields of 5-200 gpm were reported for on-site bedrock wells completed in the Sharon Sandstone/Conglomerate (Kammer 1982). Other local bedrock units capable of producing water include the Homewood Sandstone, which is generally thinner and only capable of well yields less than 10 gpm, and the Connoquenessing Sandstone. Wells completed in the Connoquenessing Sandstone in Portage County have yields ranging from 5-100 gpm but are typically less productive than the Sharon Sandstone/Conglomerate due to lower permeabilities (Winslow et al. 1966).

Figure 3-5 shows the potentiometric surface within bedrock strata at RVAAP in January 2010 (EQM 2010). The bedrock potentiometric map shows a more uniform and regional eastward flow direction than the unconsolidated zone that is not as affected by local surface topography. Due to the lack of well data in the western portion of RVAAP, general flow patterns are difficult to discern. For much

of the eastern half of RVAAP, bedrock potentiometric elevations are higher than the overlying unconsolidated potentiometric elevations, indicating an upward hydraulic gradient. This evidence suggests there is a confining layer that separates the two aquifers. In the far eastern area, the two potentiometric surfaces are at approximately the same elevation, suggesting that hydraulic communication between the two aquifers is occurring.

3.4.2 Building 1200 AOC Hydrologic/Hydrogeologic Setting

Three groundwater monitoring wells were installed at the Building 1200 AOC during the Characterization of 14 AOCs. In addition, one background monitoring well exists to the south of the AOC. Initial depths to groundwater encountered during the three AOC monitoring well installations varied from 12-20 ft bgs. All monitoring wells are currently monitored under the Facility-Wide Groundwater Monitoring Program (FWGWMP). All monitoring wells (B12mw-010 through B12mw-012 and BKGmw-010) are screened in bedrock.

Potentiometric surface of the AOC is shown in Figure 3-1. The estimated groundwater flow directions reflect the January 2010 facility-wide potentiometric data presented in the *Facility-Wide Groundwater Monitoring Program Report on the January 2010 Sampling Event* (EQM 2010). The potentiometric surface shows a general groundwater flow pattern from the southwest to the northeast. The hydraulic gradient across the AOC has an average value of 0.018 (EQM 2010). Results of slug tests performed at three monitoring wells at the Building 1200 AOC in January and February 2005 reveal an average hydraulic conductivity at the AOC of 5.70E-05 cm/s (Table 3-1).

Table 3-1. Hydraulic Conductivities Measured During the Characterization of 14 AOCs

Monitoring Well Identification	Screened Interval (ft bgs)	Geologic Material Adjacent to Screen	Hydraulic Conductivity (cm/s)
B12mw-010	10-20	Sandstone with shale interbeds	4.48E-05
B12mw-011	14-24	Sandstone with shale interbeds	6.33E-05
B12mw-012	12-22	Sandstone with shale interbeds	6.63E-05
BKGmw-010	approx 12-22	Sandstone with shale interbeds	Test not conducted

bgs = below ground surface
cm/s = centimeters per second

3.4.3 Surface Water

3.4.3.1 Regional Surface Water

RVAAP resides within the Mahoning River watershed, part of the Ohio River basin. The west branch of the Mahoning River is the main surface stream in the area. The west branch flows adjacent to the west end of the facility, generally in a north to south direction, before flowing into the Michael J. Kirwan Reservoir, which is located south of State Route 5 (Figure 1-2). The west branch flows out of the reservoir along the southern facility boundary before joining the Mahoning River east of RVAAP. The western and northern portions of RVAAP display low hills and a dendritic surface drainage pattern. The eastern and southern portions are characterized by an undulating to moderately level surface, with less dissection of the surface drainage. The facility is marked with marshy areas and flowing and intermittent streams whose headwaters are located in the facility's upland areas.

The three primary watercourses that drain RVAAP are (Figure 1-2):

- South fork of Eagle Creek;
- Sand Creek; and
- Hinkley Creek.

All of these watercourses have many associated tributaries. Sand Creek, with a drainage area of 13.9 square miles, flows generally in a northeast direction to its confluence with the south fork of Eagle Creek. In turn, the south fork of Eagle Creek continues in a northerly direction for 2.7 miles to its confluence with Eagle Creek. The drainage area of the south fork of Eagle Creek is 26.2 square miles, including the area drained by Sand Creek. Hinkley Creek originates just southeast of the intersection between State Routes 88 and 303 to the north of the facility. Hinkley Creek, with a drainage area of 11.0 square miles, flows in a southerly direction through the facility and converges with the west branch of the Mahoning River south of the facility (USACE 2001a).

Approximately one-third of RVAAP meets the regulatory definition of a wetland, with the majority of the wetland areas located in the eastern portion of the facility. Wetland areas at RVAAP include seasonal wetlands, wet fields, and forested wetlands. Many of the wetland areas are the result of natural drainage or beaver activity; however, some wetland areas are associated with anthropogenic settling ponds and drainage areas.

Approximately 50 ponds are scattered throughout RVAAP. Many were constructed within natural drainage ways to function as settling ponds or basins for process effluent and runoff. Others are natural in origin, resulting from glacial action or beaver activity. Water bodies at RVAAP support aquatic vegetation and biota as described in Section 3.6.2. Storm water runoff is controlled primarily by natural drainage except in former operations areas where an extensive storm sewer network helps to direct runoff to drainage ditches and settling ponds. In addition, the storm sewer system was one of the primary drainage mechanisms for process effluent during the period that production facilities were in operation.

3.4.3.2 Building 1200 AOC Surface Water

Surface water drainage generally follows the topography of the AOC. Intermittent surface water flows in the drainage ditch from the former operations area east to the former settling pond during precipitation events and periods of snow melt. The ditch tends to hold water for extended periods of time due to the low permeability of soil. Surface water discharge from the former settling pond occurs via an outlet channel to the southeast. Discharge flow is diffuse and enters into a heavily wooded area to the south of the pond. The nearest defined surface water conveyance (large ditch line or tributary flowing southwest to Sand Creek) that receives surface water flow lies approximately 1,000 ft to the southeast of the settling pond discharge area (Figure 3-1). During the PBA08 RI, surface water was observed as ice within the former ditch and former settling pond.

3.5 CLIMATE

The general climate of the RVAAP area is continental and is characterized by moderately warm and humid summers, reasonably cold and cloudy winters, and wide variations in precipitation from year to year. Climate data for the RVAAP area presented below were obtained from available National Weather Service records for the 30-year period of record from 1971 to 2000 at the Youngstown Regional Airport, Ohio (http://www.weather.gov/climate/xmacis.php?wfo=cle). Wind speed data for Youngstown, Ohio, are from the National Climatic Data Center (http://lwf.ncdc.noaa.gov/oa/climate/online/ccd/avgwind.html) for the available 53-year period of record from 1950 through 2002.

Average annual rainfall in the RVAAP area is 38.15 inches, with the highest monthly average occurring in July (4.14 inches) and the lowest monthly average occurring in February (2.03 inches). Average annual snowfall totals approximately 52.8 inches, with the highest monthly average occurring in January (13.8 inches). It should be noted that due to the influence of lake-effect snowfall events associated with Lake Erie (located approximately 35 miles to the northwest of RVAAP), snowfall totals vary widely throughout northeastern Ohio.

The average annual daily temperature in the RVAAP area is 48.8 ºF, with an average daily high temperature of 58.3 ºF and an average daily low temperature of 39.3 ºF. The record high temperature of 100 ºF occurred in July 1988, and the record low temperature of -22 ºF occurred in January 1994. The prevailing wind direction at RVAAP is from the southwest, with the highest average wind speed occurring in January (11.4 miles per hour) and the lowest average wind speed occurring in August (7.4 miles per hour). Thunderstorms occur on approximately 35 days per year and are most abundant from April through August. The RVAAP area is susceptible to tornadoes; minor structural damage to several buildings on facility property occurred as the result of a tornado in 1985.

3.6 POTENTIAL RECEPTORS AT THE BUILDING 1200 AOC

The following sections discuss potential human and ecological receptors at the Building 1200 AOC.

3.6.1 Human Receptors

Full-time OHARNG, BRAC, and contractor staff work at the facility. Military training and operations are conducted at the facility. The OHARNG projected future land-use for the AOC is Military Use and Training. The most representative receptor is the National Guard Trainee and, per the FWHHRAM, this constitutes the Risk Assessment Land Use of Dismounted Training-Digging. National Guard Training, in conjunction with the evaluation of agricultural-residential land uses and associated receptors, form the basis for identifying COCs. Residential Land Use, specifically the Resident Farmer receptor, is included to evaluate COCs for unrestricted land use at the AOC, as required by the CERCLA process and as outlined in the FWHHRAM (USACE 2005a).

Hunters and trappers may access the AOC for recreational purposes as part of the OHARNG wildlife management programs. Additional information on potential future Building 1200 AOC land use is included in the HHRA in Section 7.2.3. OHARNG plans to meet its future potable water needs using the local municipal water supply supplemented with potable water from on-site groundwater wells where required.

3.6.2 Ecological Receptors

RVAAP has a diverse range of vegetation and habitat resources. Habitats present within the facility include large tracts of closed-canopy hardwood forest, scrub/shrub open areas, grasslands, wetlands, open-water ponds and lakes, and semi-improved administration areas (OHARNG 2008).

Vegetation at RVAAP can be grouped into three categories: herb-dominated, shrub-dominated, and tree-dominated. Approximately 60% of the facility is covered by forest or tree-dominated vegetation. The facility has seven forest formations, four shrub formations, eight herbaceous formations, and one non-vegetated formation (OHARNG 2008).

Surface water features within RVAAP include a variety of streams, ponds, floodplains, and wetlands. Numerous streams drain the facility, including approximately 19 miles of perennial streams. The total combined length of streams at the facility is 212 linear miles. Approximately 153 acres of ponds are found on the facility. These ponds provide valuable wildlife habitat and support wood ducks, hooded mergansers, mallards, Canada goose, and many other birds and wildlife species. Some ponds have been stocked with fish and are used for fishing and hunting (OHARNG 2008).

Wetlands are abundant and prevalent throughout the facility. These wetland areas include seasonal wetlands, wet fields, and forested wetlands. Most of the wetland areas on the facility are the result of natural drainage and beaver activity; however, some wetland areas are associated with anthropogenic settling ponds and drainage areas.

An abundance of wildlife is present on the facility; 35 species of land mammals, 214 species of birds, 41 species of fish, and 34 species of amphibians and reptiles have been identified. No federally listed species are known to reside at the facility, and no critical habitat occurs (OHARNG 2008). Ohio

State-listed plant and animal species have been identified through confirmed sightings and/or biological inventories at the facility and are presented in Table 3-2.

The Building 1200 AOC is heavily forested with the exception of the access road, a small area around the former building footprints, and the former settling pond. There are no known sightings of rare, threatened, and/or endangered species on the AOC. Additional information specific to ecological resources is included in Section 7.3.

Table 3-2. Rare Species List

CAMP RAVENNA JOINT MILITARY TRAINING CENTER (CRJMTC) RARE SPECIES LIST
27 April 2010

I. Species confirmed to be on CRJMTC property by biological inventories and confirmed sightings.

A. State Endangered

1. American bittern, *Botaurus lentiginosus* (migrant)
2. Northern harrier, *Circus cyaneus*
3. Yellow-bellied Sapsucker, *Sphyrapicus varius*
4. Golden-winged warbler, *Vennivora chrysoptera*
5. Osprey, *Pandion haliaetus* (migrant)
6. Trumpeter swan, *Cygnus buccinators* (migrant)
7. Mountain Brook Lamprey, *Ichthyomyzon greeleyi*
8. Graceful Underwing, *Catocala gracilis*
9. Tufted Moisture-loving Moss, *Philonotis Fontana var. caespitosa*
10. Bobcat, *Felis rufus*
11. Narrow-necked Pohl's Moss, *Pohlia elongata var. elongate*
12. Sandhill Crane, *Grus Canadensis* (probable nester)
13. Bald Eagle, *Haliaetus leucocephalus* (nesting pair)

B. State Threatened

1. Barn owl, *Tyto alba*
2. Dark-eyed junco, *Junco hyemalis* (migrant)
3. Hermit thrush, *Catharus guttatus* (migrant)
4. Least bittern, *Ixobrychus exilis*
5. Least flycatcher, *Empidonax minimus*
6. *Psilotreta indecisa* (caddis fly)
7. Simple willow-herb, *Epilobium strictum*
8. Woodland Horsetail, *Equisetum sylvaticum*
9. Lurking leskea, *Plagiothecium latebricola*
10. Pale sedge, *Carex pallescens*

C. State Potentially Threatened Plants

1. Gray Birch, *Betula populifolia*
2. Butternut, *Juglans cinerea*
3. Northern rose azalea, *Rhododendron nudiflorum var. roseum*
4. Hobblebush, *Viburnum alnifolium*
5. Long Beech Fern, *Phegopteris connectilis (Thelypteris phegopteris)*
6. Straw sedge, *Carex straminea*
7. Water avens, *Geum rivale*
8. Tall St. John's wort, *Hypercium majus*
9. Swamp oats, *Sphenopholis pensylvanica*
10. Shining ladies'-tresses, *Spiranthes lucida*
11. Arbor Vitae, *Thuja occidentalis*
12. American Chestnut, *Castanea dentate*

Table 3-2. Rare Species List (continued)

D. State Species of Concern

1. Pygmy shrew, *Sorex hovi*
2. Star-nosed mole, *Condylura cristata*
3. Woodland jumping mouse, *Napaeozapus insignis*
4. Sharp-shinned hawk, *Accipiter striatus*
5. Marsh wren, *Cistothorus palustris*
6. Henslow's sparrow, *Ammodramus henslowii*
7. Cerulean warbler, *Dendroica cerulea*
8. Prothonotary warbler, *Protonotaria citrea*
9. Bobolink, *Dolichonyx oryzivorus*
10. Northern bobwhite, *Colinus virginianus*
11. Common moorhen, *Gallinula chloropus*
12. Great egret, *Ardea alba* (migrant)
13. Sora, *Porzana carolina*
14. Virginia Rail, *Rallus limicola*
15. Creek heelsplitter, *Lasmigona compressa*
16. Eastern box turtle, *Terrapene carolina*
17. Four-toed Salamander, *Hemidacrylium scuta/um*
18. *Stenonema ithica* (mayfly)
19. *Apamea mixta* (moth)
20. *Brachylomia algens* (moth)
21. Sedge wren, *Cistothorus platensis*

E. State Special Interest

1. Canada warbler, *Wilsonia canadensis*
2. Little blue heron, *Egretta caerula*
3. Magnolia warbler, *Dendroica magnolia*
4. Northern waterthrush, *Seiurus noveboracensis*
5. Winter wren, *Troglodytes troglodytes*
6. Back-throated blue warbler, *Dendroica caerulescens*
7. Brown creeper, *Certhia americana*
8. Mourning warbler, *Oporornis philadelphia*
9. Pine siskin, *Carduelis pinus*
10. Purple finch, *Carpodacus purpureus*
11. Red-breasted nuthatch, *Sitta canadensis*
12. Golden-crowned kinglet, *Regulus satrapa*
13. Blackburnian warbler, *Dendroica fusca*
14. Blue grosbeak, *Guiraca caerulea*
15. Common snipe, *Gallinago gallinago*
16. American wigeon, *Anas americana*
17. Gadwall, *Anas strepera*
18. Green-winged teal, *Anas crecca*
19. Northern shoveler, *Anas clypeata*
20. Redhead duck, *Aytya americana*
21. Ruddy duck, *Oxyura jamaicensis*

NOTE: There are currently no federally listed species or critical habitat on CRJMTC property. There are a few species currently under federal observation for listing, but none listed.

3.7 PRELIMINARY CONCEPTUAL SITE MODEL

A CSM was developed in the *Performance-Based Acquisition 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1* (herein referred to as the PBA08 SAP) (USACE 2009a) to develop sampling rationales and data quality objectives (DQOs) for the PBA08 RI. The preliminary CSM included a description of primary (active) and secondary (e.g., residual contaminants in soil) contaminant sources, migration pathways, contaminant discharge points, and potential receptors based on operational history and prior investigations. This preliminary CSM, summarized below, is further refined in Section 8.0 to integrate results of the contaminant nature and extent evaluation, fate and transport modeling, and the HHRA and ERA presented in this PBA08 RI.

3.7.1 Contaminant Sources

No primary contaminant sources (e.g., pink water discharge) remain at the Building 1200 AOC; all operations were discontinued in 1971, and remaining infrastructure was removed in 2005. Secondary sources (contaminated media) identified in previous investigations and further characterized during the PBA08 RI are further described below and include soil, sediment, and surface water.

3.7.1.1 Soil

Based on previous characterization, contaminated surface soil adjacent to the former operations area and the overflow area southeast of the former settling pond is a potential secondary source of contamination. Previous analyses of surface soil data identified the presence of inorganic chemicals and a limited number of explosives and PAHs. No subsurface soil samples were collected prior to the PBA08 RI.

3.7.1.2 Sediment

Sediment within portions of the drainage ditch and former settling pond represents a potential secondary source, as well as a receptor medium for contaminants directly discharged during operations or eroded or leached from soil and transported by storm runoff. Operational data indicate the lower reaches of the ditch leading from the former operations area and former settling pond represent the most likely locations where contaminants may have accumulated. Previously detected contaminants in sediment that exceeded facility-wide background concentrations and/or ESVs include beryllium, mercury, gamma-BHC, acetone, and nitrocellulose.

3.7.1.3 Surface Water

The lower reaches of the drainage ditch and former settling pond contain water on a seasonal or intermittent basis during precipitation events and periods of snow melt. Overland flow associated with storm events generally follows the topography of the AOC, draining towards the pond. Previously detected contaminants in surface water include inorganic chemicals, explosives, and a limited number of SVOCs and VOCs. Analytical data from historical surface water samples

identified RDX in water collected from the lower reaches of the drainage ditch leading to the former settling pond, but no explosives were identified above screening levels in the former settling pond. Although intermittent in nature, surface water within the drainage ditch and former settling pond may be a potential secondary source of contamination to groundwater through infiltration. Surface water is also a periodic transport mechanism for the migration of residual contaminants from the former operations area to the former settling pond and into the discharge area from the pond.

3.7.1.4 Groundwater

The Building 1200 AOC hydrologic setting is discussed in Section 3.4.2 and illustrated in Figure 3-1. In January 2010, water level elevations at the AOC ranged from 981.6 – 990.76 ft amsl (Figure 3-1).

Previous groundwater sampling results at the Building 1200 AOC indicate the presence inorganic chemicals as COPCs. Groundwater discharge to surface water features (e.g., via base flow to streams or springs) does not occur within the AOC boundary. Groundwater was not sampled or evaluated as part of the PBA08 RI. Groundwater will be evaluated as an individual AOC for the entire facility (designated as RVAAP-66) and will be evaluated through the CERCLA process in a separate report.

3.7.2 Migration Pathways

Two general contaminant migration pathways are identified based on AOC characteristics and historical data. Surface water represents a periodic mechanism for the lateral migration of residual contaminants from surface soil within the former operations area to the former settling pond and into the discharge area from the pond. Contaminants in surface water may migrate in a dissolved phase or be adsorbed to particulates and re-suspended during periods of heavy runoff. Leaching of soil contaminants to groundwater (vertical migration), with subsequent lateral migration, is also a potential migration pathway. Modeling of contaminant leaching from soil sources and transport via groundwater is included in this RI; however, a full evaluation of the groundwater pathway will be addressed under a separate report.

3.7.3 Contaminant Discharge Points

Surface water discharge from the former settling pond is diffuse and enters into a heavily wooded area to the south of the pond. The nearest defined surface water conveyance (large ditch line or tributary flowing southwest to Sand Creek) lies approximately 1,000 ft to the southeast of the former settling pond discharge area (Figure 3-1). The closest identified potential discharge point for groundwater, based on available potentiometric data, is a tributary to Eagle Creek that lies approximately 4,100 ft to the east of the Building 1200 AOC.

3.7.4 Potential Receptors

Potential human health and ecological receptors for the Building 1200 AOC, based on current land use, Reasonable and Anticipated Future Land Use (RAFLU), and present-day ecological resources,

are discussed in Section 3.6. The current potential for human exposure to potential contaminants associated with this AOC is mitigated by inactivity at the AOC, the absence of permanent residents within RVAAP, and facility access and security controls to deter unauthorized entry. However, current land use and RAFLU at RVAAP includes the potential for human receptor exposure. In addition, terrestrial and aquatic receptors are present in the AOC vicinity. Therefore, an HHRA and ERA are included as part of the PBA08 RI, and the results are integrated into the updated CSM presented in Section 8.0.

4.0 STUDY AREA INVESTIGATION

This section presents the methods used for the development of DQOs, field data collection, analytical data management, and laboratory programs for the PBA08 RI at the Building 1200 AOC. The PBA08 RI was implemented in accordance with the PBA08 SAP to provide supplemental data to the historical data available for the AOC and support the development of this RI/FS report. The results of the PBA08 RI sampling are combined with the results of previous sampling events to evaluate the nature and extent of contamination, examine contaminate fate and transport, conduct risk assessments, and evaluate potential remedial alternatives.

As presented in Section 2.2.3, there have been several investigations at the AOC, including the Characterization of the 14 AOCs. The Characterization of 14 AOCs contained an HHRS and ERS that identified chemicals exceeding facility-wide background concentrations and/or USEPA Region 9 Residential PRGs. To develop the PBA08 SAP and establish PBA08 RI DQOs, an initial screening approach was used to focus the PBA08 RI on 1) specific chemicals and 2) areas requiring further assessment of nature and extent of contamination (Section 3.2.2 of the PBA08 SAP).

The screening approach presented in the PBA08 SAP compared sample results from previous investigations at the AOC to chemical-specific facility-wide cleanup goals (FWCUGs) for the Resident Farmer Adult, Resident Farmer Child, and National Guard Trainee at the 1E-06 cancer risk level and non-carcinogenic risk Hazard Quotient (HQ) of 0.1. The most protective of the FWCUGs for the three potential receptors are referred to as "screening criteria" in Table 4-1. Previous results were also compared to FWCUGs at the higher target risk (TR) of 1E-05 and HQ of 1.0 to facilitate the identification of potential source areas that may require additional sampling to refine the extent of contamination. Table 4-1 lists historical sample results with detected chemical concentrations exceeding screening criteria requiring further investigation in this RI, as well as the minimum and maximum detected concentrations (MDCs). These chemicals and any additional chemicals detected in samples collected during the PBA08 RI are further evaluated in this report.

Table 4-1. Chemicals Detected at Concentrations above Screening Criteria in Previous Investigations

Medium	Analyte	Units	Frequency of Detection	Minimum Detection	Maximum Detection	Screening Criteria[a]
Surface Soil[b]	Aluminum	mg/kg	19/19	8020	30000	17700
	Chromium	mg/kg	19/19	11.00	33.00	17.4
	Cobalt	mg/kg	13/13	1.30	15.00	10.4
	Manganese	mg/kg	19/19	112.00	4100.00	1450
	Thallium	mg/kg	2/13	0.93	1.50	0.61
	RDX	mg/kg	2/19	0.13	13.00	8
	Benzo(a)pyrene	mg/kg	2/3	0.01	0.16	0.022
	Dibenz(a,h)anthracene	mg/kg	1/3	0.05	0.05	0.022
Subsurface Soil	Not sampled	--	--	--	--	--

Table 4-1. Chemicals Detected at Concentrations above Screening Criteria in Previous Investigations (continued)

Medium	Analyte	Units	Frequency of Detection	Minimum Detection	Maximum Detection	Screening Criteria[a]
Sediment[b]	Aluminum	mg/kg	6/6	10000	15000	13900
	Chromium	mg/kg	6/6	15.0	18.9	18.1
	Thallium	mg/kg	1/4	1.4	1.4	0.89
Surface Water	Manganese	mg/L	3/3	0.4800	4.5000	0.63
	Thallium	mg/L	1/3	0.0015	0.0015	0.0012
	RDX	mg/L	3/3	0.0028	0.0420	0.015
	Bis(2-ethylhexyl)phthalate	mg/L	1/3	0.0045	0.0045	0.0035

This table was generated using data from the following reports: *Phase I Remedial Investigation Report for High-Priority Areas of Concern* (USACE 1998) and the *Characterization of 14 AOCs* (MKM 2007).
[a]Screening criteria are the lower of the FWCUGs for the Resident Farmer Adult, Resident Farmer Child, and National Guard Trainee based on hazard index (HI) =0.1 or Target Risk=1E-06.
[b]Sediment samples B12sd-003 through B12sd-008 were reclassified as soil samples to create this table during the development of the PBA08 SAP. Since then it has been determined that these samples are in fact sediment and not soil. Sample locations; B12ss-001 and 002 and B12sd-003 through 009 were presented inaccurately on Figures C-1 through C-3. The actual location of these sample locations is approximately 180 ft north of the location presented in the PBA08 SAP.
AOC = Area of Concern
PBA08 SAP = Performance-Based Acquisition 2008 Sampling and Analysis Plan
RDX = hexahydro-1,3,5-trinitro-1,3,5-triazine
-- Not applicable

Representatives of RVAAP, Ohio EPA, USACE Louisville, and Camp Ravenna reviewed and approved the PBA08 RI sample locations as part of the approval process for the PBA08 SAP in December 2009. The PBA08 RI, conducted in February 2010 through April 2010, included the collection of surface soil and subsurface soil using discrete and ISM sampling techniques. Surface water and sediment samples were not collected as part of the PBA08 RI. No groundwater samples were collected during the PBA08 RI. Groundwater will be evaluated as an individual AOC for the entire facility (designated as RVAAP-66) and addressed in a separate report. The following sections describe the rationale and method of sample collection for each component of the field investigation.

4.1 SOIL AND VADOSE ZONE CHARACTERIZATION

Soil samples were collected at the AOC to assess contaminant occurrence and distribution in surface and subsurface soil. All PBA08 RI and historical sample locations used in this RI are presented on Figure 4-1.

4.1.1 Surface Soil Sampling Rationale and Methods

Surface soil samples collected during the PBA08 RI at the Building 1200 AOC were collected using discrete and ISM sampling techniques. Three ISM samples were collected to further define the extent of previously identified surface soil contamination (Figure 4-1). Samples B12ss-036M and B12ss-038M were collected to delineate the lateral extent of contamination detected in previously collected

ISM samples. Sample B12ss-037M was collected to complete characterization of the former drainage ditch leading to the former settling pond. These samples were analyzed for TAL metals, explosives, and PAHs; 15% (one sample) was analyzed for the RVAAP full-suite analytes [i.e., TAL metals, explosives, propellants (nitrocellulose and nitroguanidine), SVOCs, VOCs, PCBs, and pesticides]. Table 4-2 presents the specific rationale for each surface soil sample collected for the PBA08 RI at the Building 1200 AOC.

For the PBA08 RI, the corners of each of the designated ISM sampling areas were located using a digital global positioning system (GPS) and were marked using wooden stakes. Sampling crews selected aliquot locations by walking over the entire ISM sampling area and randomly marking the requisite number of points using flagging. No less than 30 aliquots for each ISM sample were collected. Aliquot locations were selected in the field and were not predetermined using a random grid. Approximately equal sample volume aliquots were collected from a depth of 0-1 ft using a 5/8-inch diameter push tube. A soil description was completed for each ISM sample and all logs are included in Appendix A.

All aliquots collected from a given ISM sample area were combined in a labeled container for transport to the laboratory in accordance with the PBA08 SAP. At the laboratory, the sample was air-dried, sieved, and ground for specified non-volatile chemical analyses.

One quality control (QC) field duplicate and one quality assurance (QA) split sample were collected to satisfy the QA/QC requirements of 10% frequency for surface soil samples. The QC field duplicate sample was submitted to the laboratory as "blind" and was used to determine whether the field sampling technique was reproducible and as an indicator of sample heterogeneity. The QA split sample was sent to a USACE QA laboratory for independent analysis and evaluation of analytical results obtained by the primary laboratory.

QA and QC samples were collected as replicate ISM samples, requiring three separate soil ISM samples from the same area. The QA and QC samples were collected from a set of 30 aliquot locations positioned adjacent to the location used for the initial ISM sample. Aliquots for QA and QC samples were collected in separate stainless steel bowls, individually homogenized, and placed into separate, labeled containers.

The ISM was not utilized for samples collected for VOC analysis because the air drying, mixing, and sieving of aliquots required by the method could result in the loss of VOCs from the sample. For ISM sample areas designated for VOC analysis, one discrete sample was collected from a depth of 0-1 ft within the ISM sample area using the bucket hand auger method as described in the PBA08 SAP. The specific location of the discrete sample was randomly chosen. Soil portions designated for VOC analyses were not homogenized in the field but were placed directly in the sample container and compacted to zero headspace.

In addition to the ISM samples collected, three discrete chromium speciation samples were collected to evaluate the potential contribution of hexavalent chromium to the total chromium concentrations.

Chromium speciation soil samples were collected 0-1 ft bgs, in accordance with the bucket hand auger method described in Section 4.5.2.1.1 of the *Facility-Wide Sampling and Analysis Plan* (USACE 2001a) (herein referred to as the FWSAP). An updated version of the FWSAP was developed in February 2011 and approved by the Ohio EPA; however, the PBA08 RI was implemented prior to approval of this updated version. Two samples were collected from areas previously identified as having elevated total chromium concentrations and one sample was collected from an area previously identified as having a total chromium concentration near background concentrations. Field duplicate samples were not collected for chromium speciation samples. A sample log, including soil description, was completed for each sample, and all logs are included in Appendix A.

Following collection of the discrete surface soil samples, excess soil was designated as investigation-derived waste (IDW) and placed in lined, labeled 55-gal drums that were sealed after use and staged at Building 1036. Investigation-derived waste practices for all media are discussed in Appendix F. Hand-auger borings were backfilled to the ground surface with dry bentonite chips and hydrated with the project approved potable water.

Table 4-2. PBA08 RI Surface Soil Sampling Rationale

Sample Type	Depth (ft bgs)	Location	Sample	Date Sampled	Comments/Rationale
ISM	0-1	B12ss-036M	B12ss-036M-5038-SO	2/16/2010	Delineate screening criteria exceedance of historical location.
ISM	0-1	B12ss-037M	B12ss-037M-5039-SO	2/16/2010	Characterize area previously not sampled.
ISM	0-1	B12ss-037M	B12ss-037M-6049-FD	2/16/2010	QA/QC
ISM	0-1	B12ss-038M	B12ss-038M-5040-SO	2/16/2010	Delineate screening criteria exceedance of historical location. Sampled for RVAAP full-suite analytes.
Discrete	0-1	B12ss-033	B12ss-033-5041-SO	2/16/2010	Chromium Speciation-Previous Cr result represents elevated Cr concentration.
Discrete	0-1	B12ss-034	B12ss-034-5042-SO	2/16/2010	Chromium Speciation-Previous Cr result represents elevated Cr concentration.
Discrete	0-1	B12ss-035	B12ss-035-5043-SO	2/16/2010	Chromium Speciation-Previous Cr result represents Cr near background concentration.

bgs = below ground surface
Cr = Total Chromium

RVAAP = Ravenna Army Ammunition Plant

4.1.2 Subsurface Soil Sampling Rationale and Methods

Ten subsurface soil samples were collected from five boring locations to delineate the vertical extent of contamination (Figure 4-1). These locations included:

- Three borings (B12sb-027, B12sb-028, and B12sb-032) within or adjacent to previous surface soil ISM samples where chemical concentrations exceeded screening criteria;

- One boring (B12sb-031) in the former settling pond where infiltration may have carried contamination downward; and

- One boring (B12sb-030) in an area not previously investigated to confirm the absence of contamination.

Each soil boring consisted of two sample intervals: 0-1 ft bgs and 1 ft to bedrock refusal. All samples were analyzed for TAL metals, explosives, and PAHs with 15% (two) of samples analyzed for the RVAAP full-suite analytes [i.e., TAL metals, explosives, propellants (nitrocellulose and nitroguanidine), SVOCs, VOCs, PCBs, and pesticides]. One QC field duplicate and one QA split sample were collected to satisfy the QA/QC sample requirements of 10% frequency for subsurface soil samples.

Table 4-3 presents the specific rationale for each subsurface soil sample collected for the PBA08 RI at the Building 1200 AOC.

All subsurface soil samples were collected at a discrete sample location and a predetermined sample interval as presented in PBA08 SAP. All subsurface samples, except VOCs, were collected by homogenizing the predetermined sample interval as described in the FWSAP and PBA08 SAP. Samples were collected in each subsurface soil boring location at 0-1 ft (surface soil) and 1 ft bgs to (approximately) 3 ft bgs. The samples collected from each interval were submitted for laboratory analysis. Subsurface soil borings were completed by direct push technology (DPT) using a Geoprobe® and/or hand auger to a maximum sampling depth of 3.0 ft bgs due to bedrock refusal. Soil samples collected using the Geoprobe® were collected in a single use acetate liner. A lithologic soil description was completed for each soil boring and is included in Appendix A.

Two geotechnical samples were planned to collect physical soil characterization data to support fate and transport modeling; however, bedrock was encountered at approximately 3 ft bgs at the AOC. Therefore, only one geotechnical sample as collected. A pilot boring was installed with a Geoprobe® to a depth of 2.5 ft bgs to lithologically characterize the soil and determine the appropriate geotechnical sample intervals (Appendix A). The geotechnical sample location was offset from the pilot boring and drilled with hollow stem auger attachments. The geotechnical sample was collected through the hollow stem augers directly into a Shelby tube. The Shelby tube was collected from 0.4 to 2.3 ft bgs, directly above the bedrock observed in the pilot boring. The Shelby tube was sealed with wax, capped, and submitted for laboratory geotechnical analysis for porosity, bulk density,

moisture content, total organic carbon, grain size fraction analysis, and permeability. Laboratory analytical results for geotechnical samples are presented in Appendix D. Field duplicate samples were not collected for geotechnical samples.

Following collection of the samples, excess soil was designated as IDW and placed in lined, labeled 55-gal drums that were sealed after use and staged at Building 1036. IDW practices for all media are discussed in Appendix F. Subsurface borings were backfilled to the ground surface with dry bentonite chips and hydrated with approved potable water.

Table 4-3. PBA08 RI Subsurface Soil Sampling Rationale

Sample Type	Depth (ft bgs)	Location	Sample	Date Sampled	Comments/Rationale
Discrete	0-1	B12sb-027	B12sb-027-5083-SO	2/23/2010	Define vertical extent of previously identified surface contamination. Bedrock encountered at 3 ft bgs.
Discrete	1-3		B12sb-027-5084-SO	2/23/2010	
NS	4-7		B12sb-027-5085-SO	NS	
NS	7-13		B12sb-027-5086-SO	NS	
Discrete	0-1	B12sb-028	B12sb-028-5087-SO	2/23/2010	Define vertical extent of previously identified surface contamination. Bedrock encountered at 3 ft bgs. Sampled for RVAAP full-suite analytes
Discrete	1-3		B12sb-028-5088-SO	2/23/2010	
NS	4-7		B12sb-027-5089-SO	NS	
NS	7-13		B12sb-027-5090-SO	NS	
Discrete	0.5-2.3	B12sb-029	B12sb-029-5091-SO	2/23/2010	Geotechnical sample
Discrete	0-1	B12sb-030	B12sb-030-5093-SO	2/23/2010	Confirm absence of contamination in an area not previously sampled. Bedrock encountered at 2.8 ft bgs.
Discrete	1-2.8		B12sb-030-5093-SO	2/23/2010	
NS	4-7		B12sb-027-5094-SO	NS	
NS	7-13		B12sb-027-5095-SO	NS	
Discrete	0-1		B12sb-030-6076-FD	2/23/2010	QA/QC
Discrete	0-1		B12sb-030-6078-QA	2/23/2010	
Discrete	0-1	B12sb-031	B12sb-031-5097-SO	2/23/2010	Define vertical extent of contamination from the former settling pond. Bedrock encountered at 1.8 ft bgs. Water present in settling pond during sampling, so the 0-1 ft bgs sample interval was classified as sediment.
Discrete	1-1.8		B12sb-031-5098-SO	2/23/2010	
NS	4-7		B12sb-031-5099-SO	NS	
NS	7-13		B12sb-032-5100-SO	NS	
Discrete	0-1	B12sb-032	B12sb-032-5101-SO	2/23/2010	Define vertical extent of former exceedance. Bedrock encountered at 2.8 ft bgs.
Discrete	1-2.8		B12sb-032-5102-SO	2/23/2010	
NS	4-7		B12sb-032-5103-SO	NS	
NS	7-13		B12sb-032-5104-SO	NS	

bgs = below ground surface
NS= not sampled due to refusal
PBA08 RI = Performance-Based Acquisition 2008 Remedial Investigation
QA/QC = Quality Assurance/Quality Control
RVAAP = Ravenna Army Ammunition Plant

4.2 SURFACE WATER AND SEDIMENT CHARACTERIZATION

The Building 1200 AOC includes two drainage areas: the drainage ditch leading from the former operations area to the former settling pond, and the former discharge area southeast of the former settling pond. The former discharge area southeast of the former settling pond is generally dry and contains water only following rainfall or snow melt; therefore, samples collected from this area are classified as surface soil based on RVAAP standardized definitions of wet and dry sediment (i.e., surface soil). No additional surface water samples were collected during the PBA08 RI.

These drainage areas and the former settling pond do not discharge to any other surface water bodies and contain water only seasonally. Previous sampling of the drainage ditch and former settling pond has defined the lateral extent of contamination. A soil boring was advanced through the bottom of the former settling pond to delineate the vertical extent of contamination in subsurface soil. Ice was present in the former settling pond at the time of this soil boring and the sample collected from the 0-1 ft interval of this soil boring is defined as a discrete sediment sample per the RVAAP definition of wet and dry sediment. No other samples were collected of these media during the PBA08 RI.

4.3 ASBESTOS INSPECTION

A visual inspection for asbestos-containing material (ACM) was performed at Building 1200 in September 2011 by an Asbestos Hazard Evaluation Specialist. The Asbestos Visual Inspection Report is in Appendix A. The Asbestos Hazard Evaluation Specialist did not identify any visibly discernable ACM at the AOC. The visual inspection identified a mound near former Building T-4602 that may need further investigation. The estimated height of the mound is approximately 4 ft. Further investigation and potential remediation will be included as part of the remedial alternative selected for this AOC.

4.4 CHANGES FROM THE WORK PLAN

Changes to the PBA08 SAP are documented in field change requests (FCRs) provided in Appendix B. Changes made in the field based on current conditions are not documented on FCRs but on the field sampling logs (Appendix A). Only one change was made to the planned field sampling at the Building 1200 AOC– the geotechnical sample (B12sb-029-5091-SO) planned for collection at location B12sb-029 was moved 20 ft to the east because the original location (a ditch) was filled with water from snowmelt and not accessible with the Geoprobe®. Revised coordinates were recorded on the field sampling log.

4.5 ANALYTICAL PROGRAM OVERVIEW

The following sections describe the analytical program followed during the PBA08 RI.

4.5.1 Data Quality Objectives

Samples were collected and analyzed according to the FWSAP and the PBA08 SAP that were prepared in accordance with USACE and USEPA guidance. The FWSAP and PBA08 SAP outline the organization, objectives, intended data uses, and QA/QC activities to perform in order to achieve the desired DQOs for maintaining the defensibility of the data. Project DQOs were established in accordance with USEPA Region 5 guidance. Requirements for sample collection, handling, analysis criteria, target analytes, laboratory criteria, and data verification criteria for the RI are consistent with USEPA and United States Department of Defense (DoD) requirements. DQOs for this project included analytical precision, accuracy, representativeness, completeness, comparability, and sensitivity for the measurement data. Appendix C presents an assessment of the analytical program objectives.

4.5.2 Quality Assurance and Quality Control

Samples were properly packaged for shipment and transferred by courier to the laboratory for analysis. A signed chain-of-custody record (included in Appendix D) with sample numbers and locations was enclosed with each shipment. When transferring the possession of samples, the individuals relinquishing and receiving the samples signed, dated, and noted the time on the record. All shipments were in compliance with applicable U.S. Department of Transportation (USDOT) regulations for environmental samples.

QA/QC samples for this project included field blanks, trip blanks, QC field duplicates, QA split samples, laboratory method blanks, laboratory control samples (LCS), laboratory duplicates, and matrix spike/matrix spike duplicate (MS/MSD) samples. Table 4-4 presents a summary of QA/QC samples utilized during the PBA08 RI and how each sample type was used to support the quality of the analytical data. Evaluation of QA/QC samples and their contribution to documenting the project data quality is provided in Appendix C.

Table 4-4. Summary of PBA08 RI QA/QC Samples

Sample Type	Rationale
Field Blank	Analyzed to determine contamination in source material that may contribute to sample contamination
Trip Blank	Analyzed to assess the potential for cross contamination of samples due to contaminant interference during sample shipment and storage
Field Duplicate	Analyzed to determine sample heterogeneity and sampling methodology reproducibility
Equipment Rinsate	Analyzed to assess the adequacy of the equipment decontamination processes for non-dedicated sampling equipment
Laboratory Method Blanks	Analyzed to assess the contamination level in the laboratory preparation and analysis process
Laboratory Duplicate Samples	Analyzed to assist in determining the analytical reproducibility and precision of the analysis for the samples of interest and provide information about the effect of the sample matrix on the measurement methodology
Matrix Spike/Matrix Spike Duplicate	
Laboratory Control Sample	Analyzed to determine the accuracy and precision of the analytical method implemented by the laboratory and to monitor the laboratory's analytical process control
QA Split	Analyzed to provide independent verification of the accuracy and precision of the principal analytical laboratory

PBA08 RI = Performance-Based Acquisition 2008 Remedial Investigation
QA = Quality assurance
QC = Quality control

4.5.3 Field Analyses

No field laboratory analyses (i.e., field explosives testing or ISM processing) were conducted for the PBA08 RI. Field screening for organic vapors was not used to guide sampling or analytical efforts. Organic vapors were monitored in the breathing zone during drilling for health and safety purposes at each subsurface soil boring location.

4.5.4 Laboratory Analyses

Samples collected during the PBA08 RI were analyzed by TestAmerica Laboratories, Inc. (herein referred to as TestAmerica) of North Canton, Ohio and West Sacramento, California as a subcontractor to White Water Associates, Inc., of Amasa, Michigan. Collected QA split samples were analyzed by USACE's contracted QA laboratory, RTI Laboratories, Inc., of Livonia, Michigan. TestAmerica and RTI Laboratories, Inc. are accredited by the DoD Environmental Laboratory Accreditation Program (ELAP).

All analytical procedures were completed in accordance with applicable professional standards, USEPA requirements, government regulations and guidelines, DoD Quality Systems Manual (QSM) Version 3, USACE Louisville District analytical QA guidelines, and specific project goals and requirements. In addition to these standards, strict adherence to the requirements set forth in the FWSAP and PBA08 SAP was required of the analytical laboratories so that conditions adverse to data quality would not arise. Preparation and analyses for chemical parameters were performed according to the methods listed in Table 4-5. Additionally, soil geotechnical analysis for porosity, bulk density, moisture content, grain size fraction, and permeability were performed in compliance with American Society for Testing and Materials (ASTM) test methods.

Table 4-5. Summary of PBA08 RI Preparation and Analytical Procedures

Parameter	Soil and Sediment	
	Preparation	Analysis
Inorganic chemicals	SW-846 3050B	SW-846 6020
Mercury	--	SW-846 7471A
Explosives	--	SW-846 8330B
SVOCs and PAHs	SW-846 3540C	SW-846 8270C
Propellants: Nitrocellulose Nitroguanidine	 -- SW-846 3550A	 353.2 Modified SW-846 8330M
VOCs	SW-846 5030B	SW-846 8260B
Pesticides	SW-846 3540C	SW-846 8081A
PCBs	SW-846 3540C	SW-846 8082
Hexavalent Chromium	SW-846 3060A	SW-846 7196A

PAH = Polycyclic Aromatic Hydrocarbon

PCB = Polychlorinated Biphenyl
SVOC = Semi-volatile Organic Compound
VOC = Volatile Organic Compound
-- = Preparation steps included in analytical method

SAIC is the custodian of the project files and will maintain the contents of the files for this investigation, including all relevant records, reports, logs, field notebooks, photographs, subcontractor reports, correspondence, and sample custody forms. These files will remain in a secure area under the custody of the SAIC project manager until they are transferred to USACE, Louisville District and RVAAP at the end of the PBA08 project. Analytical data reports from the project laboratory will be forwarded to the USACE Louisville District laboratory data validation contractor for validation review and QA comparison upon request. White Water Associates, Inc. and TestAmerica will retain all original raw data (both hard copy and electronic) in a secure area under the custody of the laboratory project manager for a minimum of seven years.

4.5.5 Data Review, Verification, and Quality Assessment

Data were produced, reviewed, and reported by the laboratory in accordance with specifications in the PBA08 SAP, the Louisville District analytical QA guidelines, and the laboratory's QA manual.

TestAmerica performed in-house analytical data reduction under the direction of the laboratory project manager and QA officer. These individuals were responsible for assessing data quality and informing SAIC and USACE of any data considered "unacceptable" or which required caution on the part of the data user in terms of its reliability.

Final reports were generated by the laboratory project manager. Data were then delivered to SAIC for data verification. TestAmerica prepared and retained full analytical and QC documentation for the project in both paper copy and electronic storage media (e.g., compact disk), as directed by the analytical methodologies employed. Laboratory reports included documentation verifying analytical holding time compliance.

SAIC performed a systematic process utilizing automated data review (ADR) software for data verification to ensure the precision and accuracy of the analytical data were adequate for their intended use. The ADR outlier reports are included as Attachment 1 to Appendix C. This verification also attempted to minimize the potential of using false-positive or false-negative results in the decision-making process (i.e., to ensure accurate identification of detected versus non-detected chemicals). This approach was consistent with the DQOs for the project and with the analytical methods used for determining COCs and calculating risk. "Definitive Data" were reported consistent with the deliverables identified in the project SAP. These definitive data were then verified through the review process outlined in the project SAP and presented in Appendix C. During the review process, four non-detect antimony soil results were rejected due to poor matrix spike recoveries. These four results comprised only 0.34% of the data for the Building 1200 AOC. Therefore, 99.7% of the data was deemed acceptable for use. Additional results were qualified as estimated, indicating accuracy, precision, or sensitivity was less than desired but adequate for their intended use. The completeness goal for analytical data is 90%, as defined in Tables 3-1 and 3-2 of the FWQAPP. The project achieved this goal by collecting all samples presented in the PBA08 SAP and producing usable results for 99.7% of all samples performed. In addition to the SAIC data review, a 10% validation of all data will be performed by USACE to prove data usability.

THIS PAGE INTENTIONALLY LEFT BLANK.

5.0 NATURE AND EXTENT OF CONTAMINATION

This section presents results of the RI analytical data obtained during the PBA08 RI, the data screening process to identify SRCs indicative of potential impacts from AOC operations, and nature and extent of SRCs in environmental media at the Building 1200 AOC. The data incorporated in this evaluation included samples from previous investigations.

Section 5.1 presents the statistical methods and screening processes used to distinguish constituents present at ambient concentrations (background concentrations) from those present at concentrations that indicate potential impacts related to historical operations within the AOC. Section 5.1 also presents data aggregates based on environmental media, AOC characteristics, and spatial distribution of samples. The nature and extent of contamination in all sampled environmental media is presented in Sections 5.2.2, 5.2.3, 5.2.5, and 5.2.6 [surface soil (discrete and ISM samples) subsurface soil, sediment, surface water]. Each section presents the results of the PBA08 RI, identified SRCs (utilizing historical and current data), and a summary of the nature and extent of SRCs within each environmental media and spatial data aggregates. Summary analytical results are presented in graphical or tabular formats in the sections addressing each data aggregate. Complete analytical results are presented in Appendix D.

5.1 DATA EVALUATION METHOD

Data evaluation methods for the Building 1200 AOC are consistent with those established in the FWCUG Report. These methods were specified in the PBA08 SAP (USACE 2009a). The processes used to evaluate the analytical data involved three general steps: (1) defining data aggregates; (2) data verification, reduction, and screening; and (3) data presentation.

5.1.1 Definition of Aggregates

The Building 1200 AOC data were grouped (aggregated) in two ways for evaluation of contaminant nature and extent, HHRA, and ERA. The initial basic aggregation of data was by environmental media: soil, sediment, and surface water. For each media aggregate, an evaluation was conducted to determine if further aggregation was warranted with respect to AOC characteristics, historical operations, ecological habitat, and potential future remedial strategy and land use (e.g., spatial aggregates). Data for soil were further aggregated based on depth and sample type for consistency with RVAAP human health risk exposure units (EUs) and guidance established in the *Facility-Wide Human Health Risk Assessor Manual* (USACE 2005a) (herein referred to as the FWHHRAM) and FWCUG Report. Data aggregates for evaluating the nature and extent of contamination are as follows:

- Surface Soil (0-1 ft bgs): This medium is evaluated as an AOC-wide aggregate. Further subdivision into spatial aggregates was not warranted due to small size of the AOC, consistent physical characteristics, and limited AOC historical operations.

- Subsurface Soil (> 1 ft bgs): This medium is evaluated as an AOC-wide aggregate on the same basis as surface soil. Due to shallow bedrock beneath the AOC, no subsurface soil samples deeper than 3 ft bgs were collected.

- Sediment: Sediment from the former settling pond and the drainage ditch leading to the former settling pond is also evaluated as an AOC-wide aggregate; however, both ISM and discrete data are available for this medium. It is inappropriate to combine data from these two sample types; therefore, these two sample types are evaluated separately.

- Surface Water: This medium is evaluated as an AOC-wide aggregate. Surface water sampling data is limited to the former settling pond and the lower reaches of the drainage ditch leading to the settling pond and was not divided further into spatial aggregates.

The soil data aggregates are further subdivided to define human health and ecological risk EUs in the risk assessments as discussed in Section 7.0 (e.g., shallow surface soil, deep surface soil, subsurface soil).

5.1.2 Data Verification, Reduction, and Screening

5.1.2.1 Data Verification

Data verification was performed on 19 surface soil, subsurface soil, and sediment samples (including QC duplicates) collected during the PBA08 RI. Analytical results were reported by the laboratory in electronic format and loaded into the REIMS database. As discussed in Section 4.5.5, data verification was performed to ensure all requested data were received and complete. Data qualifiers were assigned to each result based on the laboratory QA review and verification criteria. Results were qualified as follows:

- "U" not detected;
- "UJ" not detected, reporting limit estimated;
- "J" indicates the analyte was positively identified, but the associated numerical value is an approximate concentration of the analyte in the sample; and
- "R" result not usable.

In addition to assigning qualifiers, the verification process also selected the appropriate result to use when re-analyses or dilutions were performed. Where laboratory surrogate recovery data or laboratory QC samples were outside of analytical method specifications, the verification chemist determined whether laboratory re-analysis should be used in place of an original reported result. If the laboratory reported results for both diluted and undiluted samples, diluted sample results were used for those analytes that exceeded the calibration range of the undiluted sample. A complete discussion verification process results is contained in the Data Quality Control Summary Report (Appendix C). The data quality summary report also includes a summary table of the assigned data qualifiers and the accompanying rationale. Independent, third-party validation of 10% of the RI data, and 100% of the USACE QA laboratory data, was performed by a subcontractor to USACE,

Louisville District. Additional qualification of the RI data may be required based on the results of the validation process.

5.1.2.2 Data Reduction

The initial step in the data reduction process to identify SRCs was calculating data summary statistics. Eligible historical and current AOC data were extracted from the database. Results from QC splits and field duplicates, as well as rejected results, were excluded from the data screening process. All analytes having at least one detected value were included in the data reduction process. Summary statistics calculated for each data aggregate included the minimum, maximum, and average (mean) detected values and the proportion of detected results to the total number of samples collected. For calculation of mean detected values, non-detected results were addressed by using one-half of the reported detection limit as a surrogate value during calculation of the mean result for each compound. Nondetected results with elevated detection limits (more than 5x the contract-required detection limit) were excluded from the summary statistics in order to prevent skewing the calculation of mean values.

5.1.2.3 Data Screening

Following reduction, the data were screened to identify SRCs using the processes outlined below. Additional screening of identified SRCs was conducted specifically for the following: (1) the fate and transport evaluation (Section 6.0) to identify CMCOPCs; (2) the HHRA to identify human health COPCs and COCs (Section 7.2); and (3) the ERA to evaluate COPECs (Section 7.3). Figure 5-1 illustrates the screening process to identify SRCs and COPCs at the Building 1200 AOC in accordance with the FWCUG Report. The steps involved in the SRC screening are summarized as follows:

- Data quality assessment – Discussed in Section 4.5.

- Background screening – The MDCs of inorganic chemicals were compared to the RVAAP background concentrations published in *Phase II Remedial Investigation Report for the Winklepeck Burning Grounds* (USACE 2001b). If exceedances above background concentrations occur, the respective inorganic chemicals are retained as SRCs.

- Screening of essential human nutrients – Chemicals considered essential nutrients (e.g., calcium, chloride, iodine, iron, magnesium, potassium, phosphorous, and sodium) are an integral part of the human food supply and are often added to foods as supplements. USEPA recommends these chemicals not be evaluated unless they are grossly elevated relative to background concentrations or would exhibit toxicity at the observed concentrations at an AOC (USEPA 1989). Recommended daily allowance (RDA) and recommended daily intake (RDI) values are available for all of these chemicals. Screening values for receptors ingesting 100 mg of soil per day or 1 L of groundwater per day to meet their RDA/RDI are listed in Table 5-1. In the case of calcium, magnesium, phosphorous, potassium, and sodium, a receptor ingesting 100 mg of soil per day

would receive less than the RDA/RDI value, even if the soil consisted of the pure mineral (i.e., soil concentrations at 1,000,000 mg/kg). Essential nutrients detected at or below their RDA/RDI-based screening levels are eliminated as SRCs.

- Frequency of detection/WOE screening – Chemicals never detected in a given medium were eliminated as SRCs. For chemicals with at least 20 samples and a frequency of detection of less than 5%, a WOE approach was used to determine if the chemical is AOC-related. The WOE evaluated magnitude and location (clustering) of detected results and if the distribution of detected results indicated a potential source of the chemical. If the detected results for a chemical showed: 1) no clustering, 2) concentrations were not substantially elevated relative to detection limit, and 3) the chemical did not have an evident source, the results were considered spurious, and the chemical was eliminated from further consideration. This screen is applied to all organic and inorganic chemicals with the exception of explosives and propellants; all detected explosives and propellants are considered as SRCs regardless of frequency of detection. No frequency-of-detection/WOE screening was performed for soil, surface water, or sediment because fewer than 20 samples are available for these datasets.

All chemicals that were not eliminated during the screening steps were retained as SRCs.

Table 5-1. Recommended Dietary Allowances /Reference Daily Intake Values

Essential Human Nutrient	USDA RDA/RDI[a] Value
Calcium	1000 mg/d
Chloride[b]	3400 mg/d
Iodine	150 µg/d
Iron	8 mg/d
Magnesium	400 mg/d
Potassium[b]	4700 mg/d
Phosphorous	700 mg/d
Sodium[b]	2300 mg/d

[a] Dietary reference intakes vary by gender and age, values present are for life stage group: Males 19-30 years.
[b]Adequate Intake Value
USDA = U.S. Department of Agriculture
RDA = Recommended Dietary Allowance
RDI = Recommended Daily Intake
Values were obtained from http://fnic.nal.usda.gov charts.

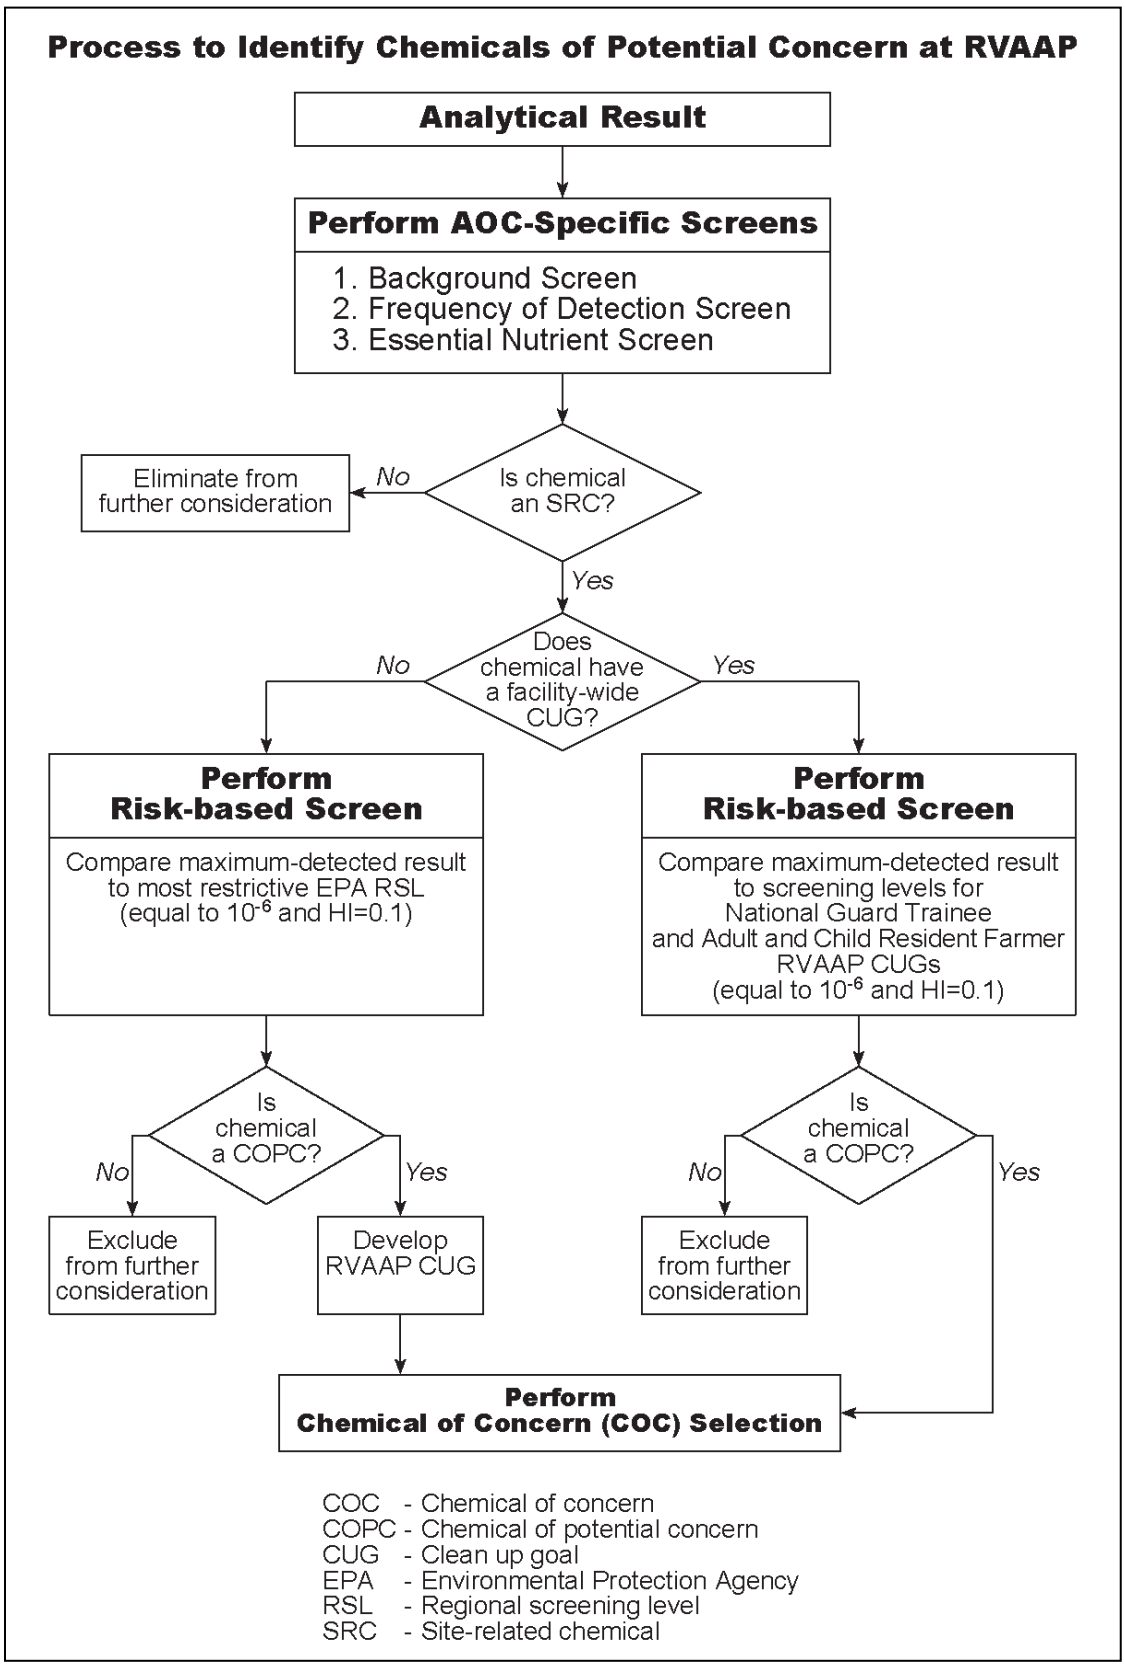

Figure 5-1. Process to Identify RVAAP Chemicals of Potential Concern in the Human Health Risk Assessment

5.1.3 Data Presentation

Data summary statistics and screening results for SRCs in surface soil, subsurface soil, sediment, and surface water are presented for each media (Sections 5.2.2, 5.2.3, 5.2.5, and 5.2.6). Analytical results for SRCs are presented by sample location on Figures 5-2 through 5-6. To provide an indication of the nature and extent of contamination, concentrations of SRCs that exceed the lowest FWCUG, based on either the National Guard Trainee or Resident Farmer Adult or Child, are highlighted [TR = 10^{-5} and/or hazard index (HI) = 1.0 or background concentration]; these are further evaluated in Section 7.0. In the sections addressing nature and extent of contamination for each media, analytical results for SRCs are also presented in data summary tables whenever a sufficient number of detected values occurred to merit such tables. Where few detected values for a class of SRCs occurred, the values are addressed in the text of the section. Complete analytical results, including all nondetected results, are contained in Appendix D. In order to maximize efficiency for laboratory reporting and data management activities, all of the samples received at the laboratory on a given day were reported in a single data package. Therefore, results may be present in the data packages in Appendix D which are associated with different AOCs. All samples for the Building 1200 AOC have sample IDs beginning with "B12." Each table in Appendix D presents the results for each sampling location for a specific medium aggregate (e.g., surface soil, subsurface soil, sediment) and class of analytes. Selected constituents are presented in graphical format to depict spatial and vertical distribution.

5.1.4 Data Evaluation

As discussed in Section 2.2.3, surface soil, surface water, and sediment samples were collected during prior investigations including the Phase I RI for High-Priority AOCs (USACE 1998) and the Characterization of 14 AOCs. Surface soil, subsurface soil, and sediment samples were collected during the PBA08 RI. All available sample data were evaluated to determine suitability for use in the various key RI data screens and evaluations (nature and extent, fate and transport, risk assessment). Evaluation of data suitability for use in the PBA08 RI involved two primary considerations: 1) representativeness with respect to current AOC conditions, and 2) sample collection methods (e.g., discrete vs. ISM).

Prior data, along with samples collected as part of PBA08 RI activities, represent different conditions of the AOC over approximately 14 years. For example, between the 2004 sampling and the 2010 PBA08 RI sampling, all structures at the AOC were demolished; therefore, the older surface soil data do not represent current AOC conditions. Likewise, surface water data collected in 2004 do not represent current conditions. To address use of data for this RI, prior samples collected from areas disturbed or re-graded and no longer represented current AOC conditions were assigned for nature and extent assessment only. These prior data have utility for assessing past conditions and changes over time in evaluating contaminant nature and extent. Prior samples from undisturbed areas and current samples were retained for use in the nature and extent evaluation, fate and transport modeling, and risk assessments.

Surface soil and sediment samples have been collected using both discrete methods and ISM. All data were incorporated into contaminant nature and extent evaluation. However, surface soil was sampled using both methods; therefore, only samples collected using ISM and representing current AOC conditions were screened for SRCs and carried forward into the risk assessment. Corresponding discrete samples were retained for nature and extent evaluation only. Sediment samples were also collected using both discrete and ISM methods; both discrete and ISM samples collected in 2004 and 2010 were deemed to be representative of current conditions, screened for SRCs, and evaluated separately so as not to mix data types. The sediment sample population also includes a series of discrete samples collected in 1996 as part of the Phase I RI for High-Priority AOCs (USACE 1998). These samples were deemed not representative of current conditions and were used for contaminant nature and extent evaluation only (e.g., temporal trends). For subsurface soil and surface water, only discrete sample data from 2004 and 2010 were available; therefore, they were screened for SRCs and COPCs and carried forward into the risk assessment the representativeness criteria was met. Table 5-2 presents the designated use for all available Building 1200 AOC samples.

5.2 CONTAMINANT NATURE AND EXTENT

5.2.1 Surface Soil Discrete Sample Results for Chromium Speciation

During the PBA08 RI, surface soil samples were collected from three discrete sample locations and analyzed for hexavalent chromium and total chromium. Samples were collected from the three sampling areas having the highest, mid-point, and lowest total historical chromium results. This sampling was accomplished to determine the contribution of hexavalent chromium to total chromium in soil at the Building 1200 AOC for use in the HHRA (Section 7.2). Chromium speciation results are shown in Table 5-3.

5.2.2 Contaminant Nature and Extent in Surface Soil

Data from all eligible historical and PBA08 RI surface soil ISM samples were combined and screened to identify SRCs representing current conditions at the Building 1200 AOC. Table 5-4 presents the results of the SRC screening. Included in the SRC screening data were 10 ISM samples collected from 0-1 ft bgs in 2004 and 3 ISM samples collected during the PBA08 RI. The PBA08 RI samples were collected to delineate contaminants detected at previous surface soil sample locations at concentrations above COPC screening levels. Two of the samples were analyzed for TAL metals, explosives, and PAHs; one sample was analyzed for the RVAAP full-suite analytes (TAL metals, explosives, propellants, SVOCs, VOCs, PCBs, pesticides). Table 5-5 presents the results for all detected analytes in the surface soil ISM samples collected during the PBA08 RI. Complete analytical results are presented in Appendix D.

Figures 5-2 through 5-4 graphically present the distribution and concentrations of inorganic, explosive, propellant, and organic SRCs that occur at each sample location. Those SRCs detected in historical and current discrete surface soil samples are also presented on the figures for nature and

extent evaluation purposes. To illustrate the extent and magnitude of contaminants, those SRCs that exceeded the most restrictive FWCUGs at a TR of 10^{-5} and HI=1.0 (or background concentrations) are highlighted.

Table 5-2. Data Summary

Sample Id	Date	Sample Type	Use Type	Comments
Surface Soil (0-1 ft)				
B12sb-027-5083-SO	02/23/10	GR	N	PBA08 RI discrete sample from boring - limits use to nature and extent

[a]Buildings 1200, S-4605 and T-4602 were thermally demolished at the AOC in summer 2005 after sampling activities. Building slabs and footers were removed resulting in surface soil being disturbed to a minimum of 1-ft bgs around the former buildings at the AOC. Areas impacted during building demolition were re-graded for positive drainage and seeded. Backfill material was not documented in *Thermal Decomposition and Demolition of Load Line 11 and Buildings F15, 1200, S-4605, and T-4602* (MKM 2005). Sample may not represent current surface soil conditions.

AOC = Area of Concern
bgs = below ground surface
COPC = Chemical of Potential Concern
E = Nature and extent, SRC and COPC screen, and exposure point calculation (discrete samples) and risk assessment
FD = Field Duplicate
GR = Grab
GC = Grab Composite
ISM = Incremental Sampling Method
MD = Multi-increment Duplicate
N = Nature and Extent use only
VOC = Volatile Organic Compound
QC = Quality Control
S= Nature and extent, SRC and COPC screen, and sample point by sample point risk assessment
SRC = Site-related Contaminant
F = Data used for fate and transport evaluation

Table 5-3. Chromium Speciation Results

Sample Location	Hexavalent Chromium Concentration (mg/kg)	Total Chromium Concentration[a] (mg/kg)	Percent Hexavalent Chromium (%)
B12ss-033	ND	14.9	NA
B12ss-034	ND	17.5	NA
B12ss-035	0.39 J	16.1	2.4

[a]Background screening value (BSV) for total chromium = 17.4 mg/kg. No BSV is available for hexavalent chromium.
J = estimated value
mg/kg = milligrams per kilogram
ND = non-detectable concentration
NA = not applicable, no hexavalent chromium was detected

5.2.2.1 Explosives and Propellants

As illustrated on Table 5-4 and Figure 5-3, three explosive and one propellant compound were identified as SRCs (TNT, HMX, RDX, and nitrocellulose) from the ISM sample population. These SRCs occurred primarily in the former Building 1200 operations area and the furthest upstream reach of the drainage ditch to the former settling pond. PBA08 RI sample B12ss-036M was collected to delineate the extent of contamination in the former operations area; as noted in Table 5-5, no explosives were detected in this sample. A 1996 discrete sample (B12sd-004, sediment) from the central reach of the drainage ditch to the former settling pond, contained TNT at a concentration of 0.37 mg/kg. The reach of the drainage ditch was re-sampled during the PBA08 RI (B12ss-037M) and no explosives were detected. In the discharge area from the former settling pond, no explosives or propellants were detected in a 2004 ISM sample (B12ss-022M). PBA08 RI surface soil samples in this area confirmed the overall absence of explosives and propellants. HMX was detected at estimated concentrations less than reporting limits in discrete sample B12sb-032 (0.015J mg/kg) and ISM sample B12ss-038M (0.012J mg/kg).

5.2.2.2 Inorganic Chemicals

As shown on Table 5-4, 14 inorganic chemicals were identified as SRCs from the population of representative surface soil ISM samples at the Building 1200 AOC. All of these SRCs had a frequency of detection of at least 50% of the ISM sample population, with the exception of thallium (3 of 13 detections). Figure 5-2 illustrates the distribution of inorganic SRCs in all surface soil samples (discrete and ISM) collected at the Building 1200 AOC. Samples B12ss-013M, B12ss-014M, B12ss-016M, B12ss-017M, and B12ss-018M were collected in 2004 in the vicinity of former operations buildings prior to demolition and removal of building footers and slabs in 2005. Therefore, the distribution of SRCs as shown on Figure 5-2 may have been altered due to these construction activities. Key longitudinal trends and patterns noted in the distribution of inorganic SRCs are as follows:

- The maximum average concentrations for inorganic SRCs were generally observed in two ISM sample areas in the vicinity of the former the Building 1200 AOC footprint (B12ss-016M and

B12ss-017M collected in 2004). Concentrations of SRCs in surface soil decreased with distance from the former building and in sediment downstream along the drainage ditch to the former settling pond and discharge area from the pond.

- Aluminum was detected above its screening level in only one historical sample (B12ss-016M at 30,000 mg/kg) all other samples were below the background concentration (17,700 mg/kg).

- Barium, beryllium, and manganese exhibited similar longitudinal trends. The highest concentrations of these SRCs occurred in the former operations area and were fully delineated by sample B12ss-036M (i.e., no results greater than screening levels) collected during the PBA08 RI. These SRCs were not present above screening levels in sediment samples collected downstream along the drainage ditch; however, detections above screening levels were noted in the discharge area from the former settling pond (B12ss-022M collected in 2004). These prior detections were fully delineated by sample B12ss-038M collected during the PBA08 RI.

- Cadmium concentrations were highest in surface soil immediately west of the former Building 1200 (sample locations B12ss-017M, B12ss-018M, and B12sb-028). Beyond this source area, cadmium was sporadically detected above screening levels with no evident longitudinal trends.

- Chromium, cobalt, mercury, nickel, and thallium were detected above screening levels at various locations throughout the AOC; however, concentrations did not exhibit longitudinal trends either within the former operations area or in sediment along the drainage system leading from former Building 1200.

- Copper, lead, and selenium showed similar distribution patterns. Copper and lead concentrations above screening levels were highest in historical sample B12ss-017M and were limited to the production area. Selenium concentrations above screening levels occurred just west of former Building 1200 (B12ss-016M) and in sediment in the uppermost reach of the drainage ditch nearest the former operations area (B12sd-003). None of these SRCs were present above screening levels in sediment samples collected downstream along the drainage ditch nor in the discharge area from the former settling pond.

- The maximum zinc concentrations above screening levels were historically noted immediately west of the Building 1200 AOC (B12ss-017M and B12ss-018M), as well in sediment within uppermost reach of the drainage ditch nearest the former operations area (B12ss-019M and B12ss-021M). Concentrations of zinc in sample B12ss-036M (84.5 mg/kg), which delineated this area, remained slightly above its background concentration (61.8 mg/kg). Zinc concentrations decreased to below its background concentration in sediment in the central portion of the drainage ditch (e.g., B12ss-037M). In the discharge area from the former settling pond, zinc levels slightly above its background concentration were noted in 2004 (B12ss-022M); PBA08 RI sample B12ss-038M delineated the extent of zinc above its background concentration in this area.

Table 5-4. SRC Screening Summary for Surface Soil

Analyte	CAS Number	Freq of Detect	Minimum Detect	Maximum Detect	Average Result	Background Criteria[a]	SRC? (yes/no)	SRC Justification
Inorganic chemicals (mg/kg)								
Aluminum	**7429-90-5**	**13/ 13**	**11200**	**30000**	**14700**	**17700**	**Yes**	**Exceeds background**

[a]SRC screening sample population includes incremental surface soil samples collected in 2004 and 2010 representative of current area of concern (AOC) conditions.
[b]Background concentrations are the lower of the background concentrations for 0-1 ft bgs and 1-12 ft bgs from final facility-wide background concentrations for RVAAP, published in the *Phase II Remedial Investigation Report for Winklepeck Burning Grounds* (USACE 2001b).
bgs = below ground surface
HMX = Octahydro-1,3,5,7-tetranitro-1,3,5,7-tetrazocine
J = estimated value less than reporting limits
M = incremental sampling method designator
NR = not reported/not analyzed
PAHs = Polycyclic Aromatic Hydrocarbon
RDX = Hexahydro-1,3,5-trinitro-1,3,5-triazine
SRC = Site-related Contaminant
TAL = Target Analyte List
U= non-detectable concentration
* = Result exceeds background concentrations
< = less than

5.2.2.3 Semi-volatile Organic Compounds

Fourteen SVOCs were identified as SRCs from the population of representative ISM samples (Table 5-4). All SVOCs identified as SRCs were PAHs, with the exception of bis(2-ethylhexyl)phthalate. Figure 5-4 illustrates the distribution of SVOCs exceeding screening levels in surface soil. Most detected values for SVOCs were estimated levels less than reporting limits. Generally, SVOC concentrations were higher within the former operations area immediately adjacent to Building 1200 (B12ss-001) and decreased longitudinally in sediment downstream along the drainage ditch to the former settling pond, although this trend is not evident for all of the SVOCs. PBA08 RI sample B12ss-038M, which is further from the former operations area than historical samples, showed higher levels of some SVOCs than samples closer to the former buildings. Estimated concentrations of SVOCs less than laboratory reporting limits were detected in the discharge area from the former settling pond, which represents the most distant sample from the former operations area.

5.2.2.4 Volatile Organic Compounds, Pesticides, and Polychlorinated Biphenyls

Toluene was detected at one sample location (B12ss-038M) at a low, estimated concentration less than reporting limits (Figure 5-4). No pesticides or PCBs were detected or identified as SRCs in surface soil at this AOC.

5.2.3 Contaminant Nature and Extent in Subsurface Soil

Previous investigations at the Building 1200 AOC have not included subsurface soil samples; therefore, only PBA08 RI sample results were available to evaluate contaminant nature and extent. Five soil borings were completed at the Building 1200 AOC to define the vertical extent of contamination in subsurface soil. Bedrock was encountered at depths from 1.8 to 3 ft bgs in all borings; therefore, only one discrete subsurface soil sample was collected from each boring. Four of the subsurface soil samples were analyzed for TAL metals, explosives, and PAHs; one sample was analyzed for RVAAP full-suite analytes (TAL metals, explosives, SVOCs, VOCs, PCBs, pesticides). Table 5-6 presents the results of the SRC screening for subsurface soil samples and Table 5-7 summarizes the analytical results for all detected analytes. Complete analytical results are presented in Appendix D. Figure 5-5 illustrates the distribution of identified subsurface soil of SRCs in all samples collected at the Building 1200 AOC.

J = estimated value
mg/kg = milligrams per kilogram
NR = not reported/not analyzed
PAHs = Polycyclic Aromatic Hydrocarbon
R = rejected result, not useable
RVAAP = Ravenna Army Ammunition Plant
sb = soil boring
TAL= Target Analyte List
U= non-detectable concentration
* = result exceeds background concentrations
< = less than

5.2.3.1 Explosives and Propellants

No explosives were detected in subsurface soil samples. One propellant, nitrocellulose, was detected at sample location B12sb-028 near the former building footprint at a low, estimated concentration less than the laboratory reporting limit. The remaining samples were not analyzed for propellants.

5.2.3.2 Inorganic Chemicals

Five inorganic chemicals were identified as SRCs in subsurface soil samples. Given the subsurface soil sample population was comprised of five samples, any inorganic chemical detected above background concentrations was identified as a SRC. The frequency of detection of all inorganic chemical was 100%, with exception of cadmium (detected in 3 of 5 samples). The MDCs for arsenic and beryllium occurred at sample location B12sb-031 in the former settling pond. Zinc, cadmium, and lead maximum concentrations occurred at sample location B12sb-028 near the former Building 1200 footprint.

As shown on Figure 5-5, cadmium was identified as a SRC in three samples collected from three different subsurface soil borings; although all values were low, estimated concentrations less than reporting limits and no longitudinal trends were evident. Lead and zinc occurred at only B12sb-028 west of former Building 1200. Arsenic and beryllium occurred at only B12sb-031 within the former settling pond.

Examination of corresponding surface soil samples at borings B12sb-027 and B12sb-028 shows distinct vertical trends in the number and concentrations of SRCs. At boring B12sb-027, six inorganic chemicals were identified as SRCs in surface soil, whereas, only cadmium occurred in the subsurface soil interval. As a particular example, lead concentrations in surface soil at this boring location (76.1 mg/kg) decreased to less than its background concentration (11.6 mg/kg) in the subsurface interval. Within the former settling pond (B12sb-031), the shallow surface soil interval is represented by sediment (Section 5.2.5). Five inorganic chemicals exceeded screening levels in the sediment (0-1 ft bgs) sample collected at this location, and concentrations of all of these remained the same or decreased with depth.

5.2.3.3 Semi-volatile Organic Compounds

Two SVOCs (fluoranthene and pyrene) were detected at sample location B12sb-028 and, therefore, identified as SRCs. No SVOCs were detected in the remaining samples.

5.2.3.4 Volatile Organic Compounds, Pesticides, and Polychlorinated Biphenyls

One VOC (carbon disulfide) was detected at a low, estimated concentration less than the laboratory reporting limit in the sample collected from boring B12sb-028. Pesticides and PCBs were not detected in subsurface soil samples.

5.2.4 Geotechnical Subsurface Soil Sample

One soil boring was completed at the Building 1200 AOC for the purpose of obtaining geotechnical parameters to perform vadose zone soil leaching and groundwater transport modeling. Bedrock was encountered at 2.3 ft bgs. Table 5-8 summarizes the results of the geotechnical characteristics of the Building 1200 AOC soil. Complete analytical and test results are presented in Appendix D.

Table 5-8. Summary of Geotechnical Parameters

Parameters	Sample ID: B12sb-029-5091-SO
Porosity	37.5 %
Density	1.63 g/cm^3
Moisture content	22.5 %
Total organic carbon	1200 mg/kg
Size fraction analysis	16.2 % sand, 41.8 % silt, 42.0 % clay
Permeability (K)	8.2E-06 cm/sec

5.2.5 Contaminant Nature and Extent in Sediment

During the PBA08 RI, one discrete sediment sample (0-1 ft bgs) was collected in the former settling pond and analyzed for TAL metals, explosives, and PAHs. This sample was obtained from a soil boring within the former settling pond and was originally planned as a soil sample; however, the sample was reclassified in the field as sediment given that water was present in the former settling pond at that time. The results of the detected analytes for the PBA08 RI sediment sample are summarized in Table 5-9. Complete analytical results are presented in Appendix D.

The population of sediment samples deemed representative for the purposes of SRC screening include the PBA08 RI discrete sediment sample noted above and two ISM sediment samples collected in 2004. Given ISM and discrete samples represent different sample concentrations (e.g., ISM represents an average concentration over an area), the samples types were screened separately to identify SRCs. Tables 5-10 and 5-11 present the results of the data screening for the 2004 ISM samples and PBA08 RI discrete sediment sample, respectively. A population of sediment samples, collected in 1996 as part of the Phase I RI for 11 High-priority AOCs (B12sd-005 through B12sd-009), were not deemed representative of current conditions for the purposes of SRC screening; however, SRCs present in these samples are included in the nature and extent evaluation to assess potential changes in AOC conditions over time. Figure 5-6 graphically presents the locations and concentrations of SRCs identified in all sediment sample types available for the Building 1200 AOC.

CAS = Chemical Abstract Service
SRC = Site-related Contaminant
Bold indicates analyte identified as an SRC

5.2.5.1 Explosives and Propellants

Explosives were not detected in sediment within the former settling pond. One propellant, nitrocellulose, was detected in a 2004 ISM sample collected along the central reach of the drainage ditch to the former settling pond.

5.2.5.2 Inorganic Chemicals

Seven inorganic chemicals were identified as SRCs in sediment. Five of these inorganic chemicals were SRCs in ISM samples (aluminum, beryllium, cadmium, mercury, and nickel). In addition, chromium and cobalt were identified as SRCs in the PBA08 RI discrete sample collected from the former settling pond. Beryllium, cadmium, and nickel were SRCs in both ISM and discrete sample populations.

As shown on Figure 5-6, aluminum exceeded facility-wide background concentrations in one sample (B12sd-024M). Cadmium was the most frequently detected SRC among all samples; concentrations were highest in the central reach of the drainage ditch to the former settling pond. Beryllium and nickel concentrations were similar along the drainage ditch and within the former settling pond; however, these inorganic chemicals were not present above background concentrations in all discrete samples along the drainage ditch. The remainder of the inorganic chemicals were sporadically detected above background concentrations along the ditch line and within the former settling pond.

5.2.5.3 Semi-volatile Organic Compounds

Two SVOCs (both PAHs) were detected in the drainage ditch in a 2004 ISM sample (B12sd-024M) at low, estimated concentrations less than laboratory reporting limits (Figure 5-6). No PAHs were detected in sediment within the former settling pond.

5.2.5.4 Volatile Organic Compounds, Pesticides, and Polychlorinated Biphenyls

Two VOCs (2-butanone and acetone) were detected in sample B12sd-024M in the drainage ditch (Figure 5-6). The PBA08 RI discrete sediment sample from the former settling pond was not analyzed for VOCs and PCBs. Acetone was also detected at a low, estimated concentration less than laboratory reporting limits in a 1996 discrete sample (B12sd-009) collected within the former settling pond. One pesticide, lindane, was also detected in sample B12sd-024M collected from the drainage ditch. PCBs were not detected in any sediment sample.

5.2.6 Contaminant Nature and Extent in Surface Water

Surface water, when present at the Building 1200 AOC, is transient and occurs mainly as storm runoff or snow melt accumulation in the lower reaches of the drainage ditch to the former settling pond and within the pond. Two surface water samples were collected during the Characterization of 14 AOCs (in 2004), which were used to perform SRC screening. Re-sampling of surface water was not planned as part of the PBA08 RI. Table 5-12 summarizes the results of the surface water SRC screening. Figure 5-6 graphically presents the locations of surface water samples and concentrations of SRCs.

5.2.6.1 Explosives and Propellants

Three explosive compounds (3-nitrotoluene, HMX, and RDX) and one propellant (nitroglycerin) were identified as SRCs in surface water; HMX and RDX occurred at both sampling locations. Decreasing concentrations of explosives, HMX and RDX in particular, were evident from upstream (B12sw-025) in the drainage ditch to downstream within the former sedimentation pond (B12sw-026).

5.2.6.2 Inorganic Chemicals

As shown on Table 5-12, five inorganic chemicals were identified as SRCs in surface water. As shown on Figure 5-6, chromium, manganese, and nickel exceed screening levels at both locations.

5.2.6.3 Semi-volatile Organic Compounds

Six SVOCs were identified as SRCs in surface water on the basis of a single detected result, five of which were present at only sample location B12sw-025 (Figure 5-6). Bis(2-ethylhexyl)phthalate was detected only at sample location B12sw-026 in the former settling pond. None of the identified SRCs were PAHs, which indicates a lack of transfer or a partitioning from associated soil source areas or sediment where most of the identified SVOCs were PAHs. Three of the detected SVOCs at sample location B12sw-025 were phenolic compounds, which were not identified as SRCs in soil or sediment media.

5.2.6.4 Volatile Organic Compounds, Pesticides, and Polychlorinated Biphenyls

Two VOCs were identified as SRCs (acetone and toluene). Acetone was detected at both surface water sample locations at low, estimated concentrations less than laboratory reporting limits. PCBs and pesticides were not detected in the surface water.

[a]Background concentrations for 0-1 ft bgs from final facility-wide background concentrations for RVAAP, published in the *Phase II Remedial Investigation Report for Winklepeck Burning Grounds* (USACE 2001b).

Bold indicates analyte identified as an SRC

bgs = below ground surface
CAS = Chemical Abstract Service
HMX = Octahydro-1,3,5,7-tetranitro-1,3,5,7-tetrazocine
RDX = Hexahydro-1,3,5-trinitro-1,3,5-triazine
SRC = Site-related Contaminant

5.3 SUMMARY OF CONTAMINANT NATURE AND EXTENT

Between the four media (surface soil, subsurface soil, sediment, and surface water) evaluated, surface soil (0-1 ft bgs) contains the majority of the SRCs. Thirty-three SRCs were identified in surface soil (0-1 ft bgs), 9 in subsurface soil (>1 ft bgs), 13 in sediment, and 17 in surface water. Not one chemical was identified as a SRC in all media evaluated for this report.

5.3.1 Surface Soil

The highest concentrations of inorganic SRCs, explosives, propellants, and SVOCs occur in the vicinity of the former Building 1200 footprint. Outside of the Building 1200 footprint, explosives and propellants were generally detected sporadically. Low, estimated concentrations of HMX in sediment in the discharge area from the former settling pond indicate some historical migration from the former operations area, although concentrations in sediment within the former settling pond were less than detection limits. The number and concentrations of SVOCs in surface soil generally decrease with distance from the former Building 1200 footprint. Discrete samples collected from soil borings drilled in this area during the PBA08 RI do not indicate the same magnitude of concentrations as historical ISM samples taken prior to demolition activities. Toluene was detected at one sample location at a low, estimated concentration less than reporting limits. No pesticides or PCBs were detected or identified as SRCs in surface soil at this AOC.

5.3.2 Subsurface Soil

Soil overburden is approximately 3 ft thick across the AOC. Subsurface soil sample locations B12sb-031 and B12sb-028 each had three SRCs (arsenic, beryllium, and cadmium in B12sb-031 and cadmium, lead, and zinc in B12sb-028). Two SVOCs (fluoranthene and pyrene), one VOC (carbon disulfide), and one propellant (nitrocellulose) were detected in one sample in the area of former Building 1200 (B12sb-028). Explosives, PCBs, and pesticides were not detected in any subsurface soil sample.

5.3.3 Sediment

The majority of the identified SRCs in sediment samples were detected in the drainage ditch upstream of the former settling pond. The occurrence of SRCs in sediment was generally sporadic, with the exception of cadmium. Explosives were not detected in sediment samples collected from the lower reaches of the drainage ditch and within the former settling pond, indicating the extent to be primarily limited to surface soil within the former operations area and uppermost reach of the drainage ditch. Two SVOCs, two VOCs, one propellant, and one pesticide were detected in one sample in the drainage ditch (B12sd-024M). PCBs and pesticides were not detected in any subsurface soil sample. PCBs were not detected in any sediment sample.

5.3.4 Surface Water

Surface water within the drainage ditch and former settling pond is intermittent. Generally, the MDC for all SRCs occurred upgradient of the former settling pond. A decreasing longitudinal concentration trend was evident for manganese and explosive compounds. Given that these compounds were not identified as SRCs within sediment, their presence and the evident concentration trend indicates partitioning from surface soil in the former operations area and transport in soluble form during periods of rainfall or snowmelt. PCBs and pesticides were not detected in surface water.

NOTES:

1) LOCATIONS OF DISCRETE SURFACE SOIL AND SEDIMENT SAMPLES COLLECTED DURING THE PHASE I REMEDIAL INVESTIGATION FOR HIGH-PRIORITY AREAS OF CONCERN WERE DEPICTED INACCURATELY ON FIGURES C-1, C-2, AND C-3 IN THE PBA08 SAP. SAMPLE LOCATIONS HAVE BEEN REVISED BASED ON REVIEW OF THE PHASE I RI FIELD NOTES.

2) PROPELLANTS AND VOCs ANALYZED ONLY AT B12sb-028.

3) CONCENTRATIONS SHOWN ARE FOR SRCs AT EACH SAMPLE LOCATION. THE FULL LIST OF SRCs ARE PRESENTED IN TABLE 5-6 OF THE REPORT. CONCENTRATIONS WHICH EXCEED THE LOWEST FWCUG ARE HIGHLIGHTED TO PROVIDE AN INDICATOR OF RELATIVE MAGNITUDE.

4) IN ADDITION TO SAMPLES USED IN THE SITE RELATED CONTAMINANT (SRC) SCREENING, HISTORICAL SAMPLES MAY ALSO BE INCLUDED ON THIS FIGURE.

6.0 CONTAMINANT FATE AND TRANSPORT

Contaminant fate and transport evaluation assesses the potential for contaminants to leach from surface and subsurface soil sources at the Building 1200 AOC and impact groundwater beneath the sources and downgradient receptor locations. This evaluation is included in the decision-making process to determine whether remedial actions of sources may be necessary to protect groundwater resources. In addition to soil, sediment was also evaluated by performing a sediment screening analysis. Only SRCs found in the sediment, surface soil, and subsurface soil sample aggregates are evaluated in the fate and transport assessment for this AOC.

Computer-based contaminant fate and transport analyses were performed to predict the rate of contaminant migration through soil to groundwater (i.e., transport media) and to conservatively estimate future contaminant concentrations beneath the source. Fate and transport modeling was used to simulate vertical transport of contaminants from surface and subsurface soil sources in the AOC containing maximum observed SRCs to groundwater, as well as mixing of leachate with the saturated groundwater system beneath the source area. A summary of the principles of contaminant fate and transport is presented in this section along with the results of the screening-level modeling evaluations.

Section 6.1 describes the physical and chemical properties of the SRCs found in soil and sediment at the AOC. Section 6.2 presents a conceptual model for contaminant fate and transport that considers AOC topography, hydrogeology, contaminant sources, and release mechanisms. Section 6.3 presents a soil and sediment screening analysis to identify SRCs with the potential to migrate from the soil and sediment to the groundwater as initial CMCOPCs. Section 6.4 describes fate and transport modeling and presents CMCOCs. The summary of the fate and transport analyses are presented in Section 6.5.

6.1 PHYSICAL AND CHEMICAL PROPERTIES OF SITE-RELATED CONTAMINANTS

Surface and subsurface soil SRCs (including 15 inorganic chemicals and 20 organic chemicals) and sediment SRCs (including 7 inorganic chemicals and 6 organic chemical) were developed in Section 5.0, and are summarized below:

1. Inorganic SRCs in surface and subsurface soil include aluminum, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, manganese, mercury, nickel, selenium, thallium, and zinc.

2. Inorganic SRCs in sediment include aluminum, beryllium, cadmium, chromium, cobalt, mercury, and nickel.

3. Organic SRCs in surface and subsurface soil include TNT, 2-methylnaphthalene, benz(a)anthracene, benzenemethanol, benzo(a)pyrene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(k)fluoranthene, bis(2-ethylhexyl)phthalate, carbon disulfide, chrysene, fluoranthene,

HMX, indeno(1,2,3-cd)pyrene, naphthalene, nitrocellulose, phenanthrene, pyrene, RDX, and toluene.

4. Organic SRCs in sediment include 2-butanone, acetone, nitrocellulose, benzo(b)fluoranthene, benzo(ghi)perylene, and lindane.

These inorganic and organic SRCs are in continuous chemical and physical interaction with ambient surface and subsurface environments. The observed distributions of chemical concentrations in the environment are the result of these interactions. These interactions also determine the chemical fate of these materials. Chemicals released into the environment are susceptible to several degradation pathways including hydrolysis, oxidation, reduction, isomerization, photolysis, photo-oxidation, biotransformation, and biodegradation. Transformation products resulting from these processes may behave differently than their parent chemical in the environment.

The migration of chemicals is governed by the physical and chemical properties of the chemicals and the surface and subsurface media through which the chemicals are transferred. In general, chemicals and structures with similar physical and chemical characteristics will show similar patterns of transformation, transport, or attenuation in the environment. Solubility, vapor pressure data, chemical partitioning coefficients, degradation rates, and Henry's Law Constant (HLC) provide information that can be used to evaluate contaminant mobility in the environment. Partitioning coefficients are used to assess the relative affinities of compounds for solution or solid phase adsorption. However, the synergistic effects of multiple migrating chemicals and the complexity of soil/water interactions, including pH and oxidation-reduction potential (Eh), grain size, and clay mineral variability, are typically unknown.

The physical properties of the chemicals defined as SRCs in surface and subsurface soil are summarized in Tables E-1 and E-2 in Appendix E. The properties are used to assess the anticipated behavior of each chemical under environmental conditions. The physical properties of the chemicals defined as SRCs in sediment are summarized in Section 6.1.1 through Section 6.1.5.

6.1.1 Chemical Factors Affecting Fate and Transport

The water solubility of a chemical is a measure of the saturated concentration of the chemical in water at a given temperature and pressure. The tendency for a chemical to be transported by groundwater is directly related to its solubility and inversely related to both its tendencies to adsorb to soil and to volatilize from water (OGE 1988). Chemicals with high water solubilities tend to desorb from soil, are less likely to volatilize from water, and are susceptible to biodegradation. The water solubility of a compound varies with temperature, pH, and the presence of other dissolved constituents (including organic carbon and humic acids).

The octanol-water partition coefficient (K_{ow}) can be used to estimate the tendency for a chemical to partition between environmental phases of different polarity. The K_{ow} is a laboratory-determined ratio of the concentration of a chemical in the n-octanol phase of a two-phase system to the

concentration in the water phase. Chemicals with log K_{ow} values less than 1 are highly hydrophilic, while compounds with log K_{ow} values greater than 4 will partition to soil particles (Lyman et al. 1990).

The water/organic carbon partition coefficient (K_{oc}) is a measure of the tendency of an organic chemical to partition between water and organic carbon in the soil. The K_{oc} is defined as the ratio of the absorbed chemical per unit weight of organic carbon to the aqueous solute concentration. This coefficient can be used to estimate the degree to which an organic chemical will adsorb to soil and, thus, not migrate with groundwater. The higher the K_{oc} value, the greater is the tendency of the chemical to partition into soil (OGE 1988). The sorption coefficient (K_d) is calculated by multiplying the K_{oc} value by the fraction of organic carbon in the soil.

Vapor pressure is a measure of the pressure at which a chemical and its vapor are in equilibrium. The value can be used to determine the extent to which a chemical would travel in air, as well as the rate of volatilization from soil and solution (OGE 1988). In general, chemicals with vapor pressures lower than 10^{-7} mm mercury will not be present in the atmosphere or air spaces in soil in significant amounts, while chemicals with vapor pressures higher than 10^{-2} mm mercury will exist primarily in the air (Dragun 1988).

The HLC value for a compound is a measure of the ratio of the chemical's vapor pressure to its aqueous solubility. The HLC value can be used to make general predictions about the chemical's tendency to volatilize from water. Substances with HLC values less than 10^{-7} atm-m^3/mol will generally volatilize slowly, while chemicals with a HLC greater than 10^{-3} atm-m^3/mol will volatilize rapidly (Lyman et al. 1990).

6.1.2 Biodegradation

Organic chemicals with differing chemical structures will biodegrade at different rates. Primary biodegradation consists of any biologically-induced structural change in an organic chemical. Complete biodegradation is the biologically-mediated degradation of an organic chemical into carbon dioxide, water, oxygen, and other metabolic inorganic products (Dragun 1988). The first order biodegradation rate of an organic chemical is proportional to the concentration:

$$-dC/dt = kC \qquad \text{(Equation 6-1)}$$

Where:

C = concentration
t = time
k = biodegradation rate constant = ln 2 / $t_{1/2}$
$t_{1/2}$ = biodegradation half-life

The biodegradation half-life is the time necessary for half of the chemical to degrade. The biodegradation rate of an organic chemical is generally dependent on the presence and population size of soil microorganisms that are capable of degrading the chemical.

6.1.3 Inorganic Chemicals

Inorganic chemicals detected in soil samples are associated with both the aqueous phase and with leachable metal ions on soil particles. The transport of material from unsaturated soil to the underlying groundwater is controlled by the physical processes of precipitation percolation, chemical interaction with the soil, and downward transport of metal ions by continued percolation. The chemistry of inorganic chemical interactions with percolating precipitation and varying soil conditions is complex and includes numerous chemical transformations that may result in altered oxidation states, ion exchange, adsorption, precipitation, or complexation. The chemical reactions, which are affected by environmental conditions including pH, oxidation/reduction conditions, and the type and amount of organic matter, clay, and the presence of hydrous oxides, may act to enhance or reduce the mobility and toxicity of the metal ions. In general, these reactions are reversible and add to the variability commonly observed in distributions of inorganic chemicals in soil.

The chemical form of an inorganic chemical determines its solubility and mobility in the environment; however, chemical speciation is complex and difficult to delineate in routine laboratory analysis. Inorganic chemicals in soil are commonly found in several forms, including dissolved concentrations in soil pore water, metal ions occupying exchange sites on inorganic soil chemicals (adsorbed to inorganic soil chemicals), metal ions associated with insoluble organic matter, precipitated inorganic chemicals as pure or mixed solids, and metal ions present in the structure of primary or secondary minerals.

The dissolved (aqueous) fraction and its equilibrium sorbed fraction are of primary importance when considering the migration potential of inorganic chemicals through soil. Of the inorganic chemicals that are likely to form, chlorides, nitrates, and nitrites are commonly the most soluble. Sulfate, carbonate, and hydroxides generally have low to moderate solubility. Soluble chemicals are transported in aqueous form subject to attenuation, whereas less soluble chemicals remain as a precipitate and limit the overall dissolution of the metal ions. The solubility of the metal ions also is regulated by ambient chemical conditions, including pH and oxidation/reduction.

The attenuation of metal ions in the environment can be estimated numerically using the retardation factor (R), dispersion in higher flow system (high conductivity environments), and diffusion in low conductivity environments. R defines the extent to which the velocity of the contaminant is slowed, which is largely derived from the soil/water partitioning coefficient (K_d). The retardation factor is calculated using the following equation:

$$R = 1 + (K_d \rho_b)/ \theta_w \qquad \text{(Equation 6-2)}$$

Where:

ρ_b = the soil bulk dry density (g/cm^3)

θ_w = soil moisture content (dimensionless)

Metal ion concentrations in the environment do not attenuate by natural or biological degradation because of low volatility and solubility of the ions. Inorganic chemicals may be biotransformed or bioconcentrated through microbial activity.

6.1.4 Organic Chemicals

Organic chemicals such as SVOCs or VOCs detected in soil may be transformed or degraded in the environment by various processes, including hydrolysis, oxidation/reduction, photolysis, volatilization, biodegradation, or biotransformation. The half-life of organic chemicals in the transport media can vary from minutes to years, depending on environmental conditions and the chemical structures of the chemicals. Some types of organic chemicals are very stable, and degradation rates can be very slow. Organic degradation may either enhance (through the production of more toxic byproducts) or reduce (through concentration reduction) the toxicity of a chemical in the environment.

6.1.5 Explosives – Related Chemicals

Several explosive chemicals were detected in surface and subsurface soil at Building 1200. Microbiological and photochemical transformation may affect the fate and transport of explosive chemicals in the environment. For example, based on the results of culture studies involving the removal of TNT by activated sludge microorganisms (USABRDL 1989), it has been concluded that TNT undergoes biotransformation, but not biodegradation (USABRDL 1989). The biotransformation of TNT occurs with the reduction of the nitro groups by microbial reduction, typically under anaerobic conditions. Beneficial bacteria in these reactions include Pseudomonas, Escherichia, Bacillus, Citrobacter, Enterobacter, Klebseilla, Veillonella, and Clostridium (USACHPPM 2000). It has been found that anaerobic metabolism occurs in two stages (Funk et al. 1993). The first stage is the reductive stage in which TNT is reduced to its amino derivatives. In the second stage, degradation to non-aromatic products begins after the reduction of the third nitro group. The biotransformation rate of TNT can be rapid (ERDC 2007) and may be increased with the presence of carbon (USACHPPM 2000). Fungi and photolysis can also biotransform TNT. The predominant transformation products due to photolysis of TNT are 1,3,5-trinitrobenzene (TNB), 4,6-dinitroanthranil, 2,4,6-trinitrobezadehyde, and 2,4,6-trinitrobenzonitrite (USACHPPM 2000). The biotransformation pathway for TNT is shown in Figure E-1 in Appendix E (Kaplan and Kaplan 1982).

The biotransformation of 2,4- dinitrotoluene (DNT) has been systematically studied in laboratory cell cultures. The biotransformation pathway is shown in Figure E-2 in Appendix E (McCormick et al. 1978). The reduction products include the amino and azoxy derivatives as observed with TNT biotransformation. As with TNT and DNT, the principal mode of microbial transformation of the nitroaromatic chemicals TNB and 1,3-dinitrobenzene is reduction of nitro groups to form amino groups. TNB is a photolytic product of TNT, but will not undergo further photolysis. TNB will also resist hydrolysis. The breakdown of TNB is primarily through microbial degradation (USACHPPM 2001b).

Limited information exists regarding biotransformation or biodegradation of RDX and HMX. RDX has a natural degradation rate typically in the range of months, but may take years in more arid environments (ERDC 2007). One pilot study evaluated the treatment of pink water waste using an anaerobic fluidized-bed granular activated carbon bioreactor (USACE 2004a). The study indicated RDX biodegradation in the presence of ethanol. Such data may be useful for evaluating potential use of enhanced bioremediation as a remedial option. Figure E-3 in Appendix E (McCormick et al. 1981) shows the biotransformation pathway for RDX. A conservative biodegradation rate of 5.00E-04 per day was used for RDX (ANRCP 1999). The biotransformation, primarily by anaerobic degradation (ERDC 2007), of HMX occurs at a slow rate in the environment (USACHPPM 2001a). HMX degrades at a slower rate than RDX (ERDC 2007). HMX is primarily broken down by photolysis and has a photolytic rate constant of 0.15 days (USEPA 1988b). Breakdown products of HMX include nitrate, nitrite, and formaldehyde (USACHPPM 2001a). Figure E-4 in Appendix E (ATSDR 1997) shows the biotransformation pathway for HMX.

6.2 CONCEPTUAL MODEL FOR FATE AND TRANSPORT

The CSM, which defines the framework for fate and transport modeling, describes conditions at Building 1200 including the contaminant sources, surficial and subsurface hydrogeologic conditions, contaminant migration and pathways, and the contaminant release mechanisms.

AOC conditions described in Sections 2.0 through 5.0 include contaminant source information, the surrounding geologic and hydrologic conditions, and the magnitude of SRCs and their current spatial distribution. Information from the preliminary CSM presented in Section 3.7 and the nature and extent evaluation in Section 5.0 were used to develop the CSM for fate and transport modeling by identifying SRCs and migration pathways. The CSM is based on information and data collected for historical investigations, this RI report and informed assumptions about the AOC. Assumptions contained in the CSM are reiterated throughout this section. The better the information and the greater the accuracy of the assumptions, the more accurately the CSM describes the AOC and, therefore, the more reliable the fate and transport modeling predictions can be. A summary of the salient elements of the CSM that apply to fate and transport modeling are summarized below.

6.2.1 Contaminant Sources

No primary contaminant sources are located at the AOC. Secondary sources (contaminated media) identified in previous investigations and further characterized during the PBA08 RI are described below. Another potential secondary source of contamination at the AOC is contaminated sediment within the drainage ditch assuming that the contaminated sediment may be in equilibrium with recharging groundwater.

6.2.2 Hydrogeology

A description of the regional and AOC-specific geology and hydrology are provided in Sections 3.3 and 3.4, respectively, and are summarized below.

- The topography at the AOC gently slopes radially from a high point just southwest of the former operations buildings. Elevations across the AOC vary from approximately 990 to 1004 ft amsl. The elevation decreases gently on the eastern side of the AOC and more sharply to the west to a low point of approximately 990 ft amsl (Figure 3-1).

- Soil is typically less than 3 ft thick at the AOC and consists of clay to sand-rich silt tills with interbedded sands scattered throughout. Fine-grained sandstone with thin interbedded shale ranges from approximately 3 to 23 ft bgs were observed during monitoring well installation. Soil across the AOC is moderately permeable, poorly drained, and seasonally wet.

- Surface water drainage associated with heavy rainfall events at the AOC flows with the topography generally to the south, but the flow in the shallow bedrock aquifer flows to the northeast as described in Sections 3.4.2 and 3.4.3.2 and shown on Figure 3-1.

- Initial depth to the water table during monitoring well installation ranged from 12 to 20 ft bgs in the shallow bedrock aquifer (Figure 3-1).

6.2.3 Contaminant Release Mechanisms and Migration Pathways

Based on the information presented above, the following contaminant release mechanisms and migration pathways have been identified at the AOC:

- Contaminant leaching from soil to the water table (vertical migration) and lateral transport to a tributary of the Mahoning River;

- Contaminated sediment transported to potential downstream receptors;

- Contaminated surface water migrating to potential downstream receptors; and

- Contaminated sediment within wet ditches and deposited on ditch banks as a secondary source of leaching to the water table (vertical migration) and lateral transport to potential downgradient receptors.

The first of these pathways, which considers a primary groundwater transport pathway, is treated explicitly in this fate and transport section. Sediment transport and surface water transport pathways are evaluated in the HHRA and ERA presented in Sections 7.2 and 7.3, respectively. The fourth pathway listed above, which considers a secondary groundwater transport pathway, is evaluated using the sediment screening analysis presented in Section 6.3.3.

One of the principal migration pathways at the AOC is percolation through the unsaturated soil to the water table (i.e., vertical leaching of contaminants from soil into groundwater). However, because of the very heterogeneous nature of the unconsolidated glacial material, groundwater flow patterns within the unconsolidated soil are difficult to predict. Precipitation that does not leave the AOC as

surface runoff percolates into the subsurface. Some of the percolating water leaves this environment via evapotranspiration after little or no vertical migration. The remainder of the water percolates into the water table. As discussed in Section 6.2.4, the rate of percolation is controlled by soil cover, ground slope, saturated conductivity of the soil, and meteorological conditions. Figure 6-1 illustrates the contaminant migration conceptual model.

Once the contaminant leachate percolates through the soil and reaches the water table, it migrates with the local groundwater and discharges at the downgradient receptors. Groundwater flow likely occurs along preferential pathways (e.g., sand seams, channel deposits, or other stratigraphic discontinuities) having higher permeabilities. For inorganic chemicals, lateral migration through groundwater will be very limited due to their high retardation by the bedrock material (USACE 2003a).

Additional factors that affect the leaching rate include a chemical's solubility, sorption capacity (expressed by the K_d), and the amount of percolation. Insoluble chemicals will precipitate out of solution in the subsurface, or remain in insoluble forms with little leaching.

Another factor that affects whether a chemical will reach the water table through percolation of precipitation is the chemical's rate of decay. Most of the organic chemicals decay at characteristic rates that are proportional to the chemical's half-life. For a given percolation rate, those chemicals with long half-lives have a greater potential for contaminating groundwater than do those with shorter half-lives. For this analysis, the rate of decay/half-life was not considered.

Contaminant releases through gaseous emissions and airborne particulates are not significant at Building 1200. The AOC is vegetated, located in a humid, temperate climate, and soil moisture content is typically high, which prevents dust borne contaminant migration. Therefore, there is likely little to no gaseous emission, and contaminant levels in the air pathway are minor to nonexistent.

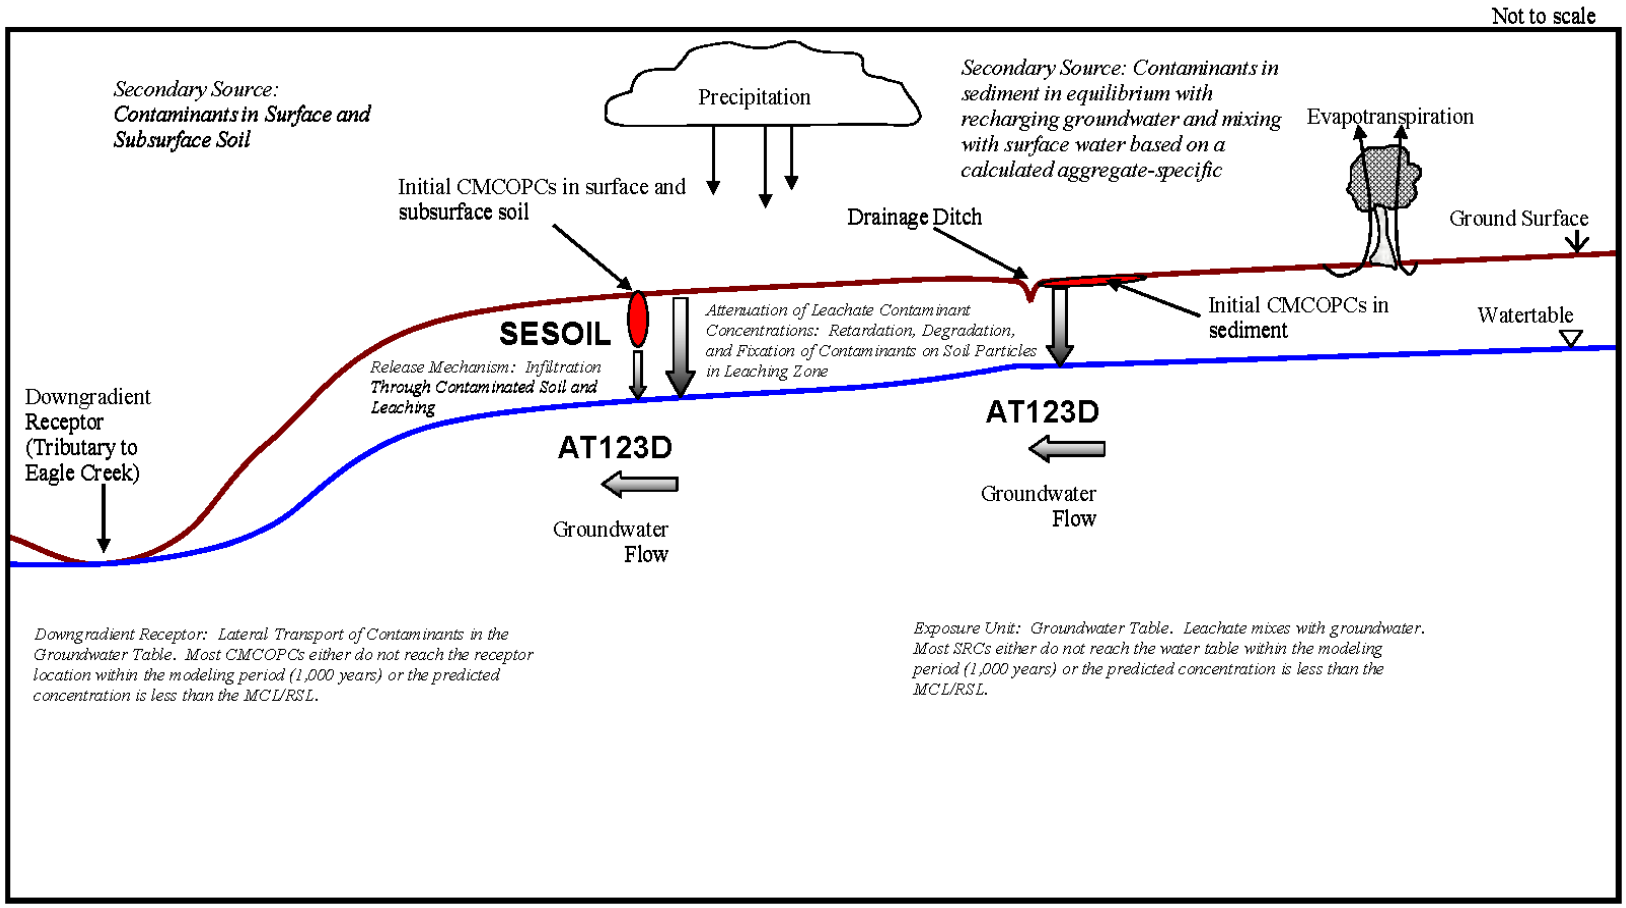

Figure 6-1. Contaminant Migration Conceptual Model

6.2.4 Water Budget

The potential for contaminant transport begins with precipitation. Percolation is the driving mechanism for leaching of soil contaminants to groundwater. The actual amount of rainwater available for flow and percolation to groundwater is highly variable and dependent upon soil type and climatic conditions. A water balance calculation can be used as a tool to quantitatively account for all the components of the hydrologic cycle. The quantified elements of the water balance are used for inputs to the soil leaching and groundwater transport models discussed later. The components of a simple steady-state water balance model include precipitation (P), evapotranspiration (ET), surface runoff (Sr), and groundwater recharge or percolation (q). These terms are defined as follows:

$$P = ET + Sr + q \qquad \text{(Equation 6-3)}$$

or

$$\text{Rainwater available for flow} = Sr + q = P - ET \qquad \text{(Equation 6-4)}$$

It is expected that loss of runoff also occurs in the form of evaporation. The remaining water after runoff and evaporation is available for percolation, which includes loss to the atmosphere by evapotranspiration. The water balance estimations were developed using the Hydrologic Evaluation of Landfill Performance (HELP) model (USEPA 1994). See Table E-3 in Appendix E for parameters used in the HELP model to develop the water balance estimates used in the evaluation. Calculations using precipitation and temperature data for a 100-year period were generated synthetically using coefficients for Cleveland, Ohio.

The annual average water balance estimates indicate an evapotranspiration of 28% (10.3 inches) of total precipitation (37 inches). The remaining 72% (27 inches) of rainwater is available for surface water runoff and percolation to groundwater. Of the 27 inches of water available for runoff or percolation, groundwater recharge (percolation) accounts for 13% (3.6 inches), and surface runoff (along topography to nearest surface water bodies) accounts for the remaining 87% (23.4 inches).

6.3 SOIL AND SEDIMENT SCREENING ANALYSIS

Soil and sediment screening analyses are screening evaluations performed to identify SRCs with the potential to leach to groundwater as CMCOPCs. The soil leachability analysis is a five step screening process. Steps include:

1. Identify SRCs for sample aggregates of interest (presented in Section 5.0);

2. Compare the maximum concentration of SRCs with generic soil screening levels (GSSLs) to develop initial CMCOPCs;

3. Compare the maximum concentration of initial CMCOPCs with site-specific soil screening levels (SSSLs) [GSSL multiplied by the site-specific dilution attenuation factor (DAF)] to refine the initial CMCOPCs;

4. Screening the initial CMCOPCs with a travel time leaching analysis of 1,000 years; and

5. Evaluate CMCOPCs using fate and transport models to develop CMCOCs.

In addition to the five step soil screening analysis, a sediment screening analysis was also performed. SRCs in sediment were screened by developing leachate concentrations assuming equilibrium between sediment and recharging groundwater and using an AOC- specific DAF.

The CMCOCs are defined as the chemicals with potential to leach to groundwater and migrate to downgradient receptor locations at a concentration exceeding the FWCUGs for the AOC-specific receptors, facility-wide background concentrations, and maximum contaminant level/regional screening level (MCL/RSL). If a predicted chemical concentration is lower than at least one of these three screening goals either below the source or at the downgradient receptors, the chemical is not a CMCOC.

6.3.1 Soil Screening Analysis

The first step of the soil screening analysis is the development of SRCs, as presented in Section 5.0 and summarized in Section 6.1.

The second step of the screening process involves comparing the maximum concentrations of the SRCs identified in Section 5.0 with MCL-based (GSSLs). The GSSLs were developed for Superfund sites for contaminant migration to groundwater (USEPA 1996b; USEPA 2010a). The GSSL is defined as the concentration of a chemical in soil that represents a level of contamination below which there is no concern for impacts to groundwater under CERCLA, provided conditions associated with soil screening levels (SSLs) are met. Generally, if chemical concentrations in soil fall below the GSSL, and there are no groundwater receptors of concern or anticipated exposures, then no further study or action is warranted for that area. If the GSSL for a chemical is not available, the USEPA risk-based SSL for soil for groundwater migration is used (USEPA 2010a). If neither the USEPA GSSL nor the USEPA risk-based SSL for a chemical is available, then no further evaluation of the chemical is performed, and it is eliminated from the list of the initial CMCOPCs. However, some chemicals have been assigned surrogates by risk assessors if the chemical without an SSL is similar to another chemical with an SSL. Surrogates used for this analysis include pyrene for benzo(ghi)perylene and phenanthrene.

The initial CMCOPC screen, as presented in Table E-4 in Appendix E, eliminates five inorganic chemicals and fourteen organic chemicals from further consideration. Ten inorganic chemicals (arsenic, barium, beryllium, cadmium, cobalt, copper, lead, manganese, selenium, and thallium), and six organic (TNT, benz(a)anthracene, benzo(b)fluoranthene, HMX, naphthalene, and RDX) SRCs exceeded their GSSLs and are carried forward to the next screening step.

The third step of the soil screening process involves comparing the maximum contaminant concentrations with the SSSLs. The SSSL is defined as the GSSL multiplied by the AOC-specific DAF. In the derivation of the GSSLs, direct partitioning is used, assuming groundwater is in contact

with the chemicals in soil and the groundwater concentration is equal to the leachate concentration. However, as leachate moves through soil, chemical concentrations are attenuated by adsorption and degradation. When the leachate reaches the water table, dilution by groundwater further reduces leachate concentrations. This reduction in concentration can be expressed by a DAF. The DAFs can vary based on AOC-specific characteristics (e.g., hydrogeologic properties, contaminated source area, depth to contamination). As described in the *Soil Screening Guidance: Technical Background Document* (USEPA 1996b), contaminant dilution in groundwater is estimated at each AOC from an AOC-specific DAF. The DAF, which is defined as the ratio of soil leachate concentration to receptor point concentration, is minimally equal to 1. Dilution in groundwater is derived from a simple mixing zone equation (Equation 6-5) and relies upon estimation of the mixing zone depth (Equation 6-6).

$$DAF = 1 + \frac{(K \times i \times d)}{(q \times L)} \qquad \text{(Equation 6-5)}$$

where:

DAF = dilution attenuation factor
K = aquifer hydraulic conductivity (m/yr)
i = horizontal hydraulic gradient (m/m)
q = percolation rate (m/yr)
L = source length parallel to groundwater flow (m)
d = mixing zone depth (m) (which is defined below)

$$d = \sqrt{0.0112 \times L^2} + d_a \times \left[1 - \exp\left(\frac{-L \times q}{K \times i \times d_a}\right)\right] \qquad \text{(Equation 6-6)}$$

where:

d_a = aquifer thickness (m)
$d \leq d_a$

As stated above, if the aquifer thickness is less than the calculated mixing zone depth, then the aquifer thickness is used for "d" in the DAF calculation. The DAF calculation is presented in Table E-5 in Appendix E. It should be noted that the purpose of this screen is not to identify the chemicals that may pose risk at downgradient locations, but to target those chemicals that may pose the greatest problem if they are migrating from the AOC.

Based on this screening and an AOC-specific DAF of 1.01, only those chemicals that exceeded their published or calculated GSSL multiplied by the DAF were identified as the initial CMCOPCs, based on leaching to groundwater. No additional SRCs were eliminated during the SSSL screening at Building 1200. These initial CMCOPCs, presented in Table E-6 in Appendix E include 10 inorganic chemicals (arsenic, barium, beryllium, cadmium, cobalt, copper, lead, manganese, selenium, and thallium), and 6 organic chemicals (TNT, benz(a)anthracene, benzo(b)fluoranthene, HMX, naphthalene, and RDX).

The fourth step of the soil screening process involves eliminating from further consideration those initial CMCOPCs identified in the SSSL evaluation which require more than 1,000 years to leach through the unsaturated zone before reaching the water table. The time period of 1,000 years was conservatively selected to evaluate eventual migration of the contaminant front to the water table despite uncertainties in vadose zone hydraulic parameters and groundwater recharge over time. Additionally, USACE (USACE 2003a) suggests a screening value of 1,000 years to be used due to the high uncertainty associated with predicting conditions beyond that time frame. Therefore, the initial CMCOPCs at the selected sources were screened against a travel time greater than 1,000 years. The travel time in this screen is the time required for a CMCOPC to migrate vertically from the base of the soil interval detected above background concentration to the water table. This distance is the leaching zone (Lz) evaluated in Table E-7 in Appendix E, which varies across the AOC based on the varying depths of soil sample concentrations above the background concentrations and the elevation of the water table. The estimated travel time for each initial CMCOPC to reach the water table is determined using the following equation:

$$T = \frac{Lz \times R}{V_p} \qquad \text{(Equation 6-7)}$$

Where:

T = leachate travel time (year)
Lz = thickness of attenuation zone (ft)
R = retardation factor (dimensionless) (Equation 6-2)
V_p = pore water velocity (ft/year)

and

$$V_p = \frac{q}{\theta_w} \qquad \text{(Equation 6-8)}$$

Where:

q = infiltration rate (ft/year)
θ_w = fraction of total porosity that is filled by water

If the travel time for a chemical from a source area exceeded 1,000 years, then the chemical was eliminated from the list of initial CMCOPCs. Initial CMCOPCs with travel times less than 1,000 years are retained for further analysis (Appendix E, Table E-7). The constituents selected for further evaluation with Seasonal Soil Compartment (SESOIL) modeling are listed in Table 6-1; these include two inorganic chemicals (copper and selenium) and four organic chemicals (TNT, HMX, naphthalene, and RDX). Arsenic, barium, beryllium, cadmium, cobalt, lead, manganese, thallium, benz(a)anthracene, and benzo(b)fluoranthene were eliminated from the list of initial CMCOPCs based on their travel times exceeding 1,000 years.

In the fifth step, the initial CMCOPCs were further evaluated using fate and transport models provided in Section 6.4.

Table 6-1. Initial CMCOPCs Identified from Soil Screening Analysis

Analyte	Maximum Concentrations (mg/kg)	ISM Sample Source Area	Sample Depth (ft bgs)	Leachate Modeling Required? (Yes/No)
Inorganic chemicals				
Copper	7.10e+01	B12ss-017M-SO	0.0 - 1.0	Yes
Selenium	1.60E+00	B12ss-016M-SO	0.0 - 1.0	Yes
Organic chemical -Explosive				
2,4,6-Trinitrotoluene	2.80E-01	B12ss-017M-SO	0.0 - 1.0	Yes

6.3.2 Limitations and Assumptions of Soil Screening Analysis

It is important to recognize that acceptable soil concentrations for individual chemicals are highly AOC-specific. The GSSLs used in this screening are based on a number of default assumptions chosen to be protective of human health for most AOC conditions (USEPA 1996b). These GSSLs are expected to be more conservative than SSSLs based on AOC conditions. The conservative assumptions included in this analysis are: (1) no adsorption in the unsaturated zone or in the aquifer; (2) no biological or chemical degradation in the soil or in the aquifer; and (3) contamination is uniformly distributed throughout the source. However, the GSSL does not incorporate the existence of contamination already present within the aquifer.

6.3.3 Sediment Screening Analysis

Sediment SRCs were developed for the AOC in Section 5.0. The purpose of this screening analysis is to identify the CMCOPCs based on contaminant migration from the sediment to the groundwater. Any identified CMCOPCs are modeled with Analytical Transient 1-, 2-, 3-Dimensional (AT123D) to a downgradient receptor if present. The steps for the sediment screening analysis include:

1. Determine the maximum concentration for each sediment SRC.

2. Estimate the maximum leaching concentration of a sediment SRC by applying the equilibrium partitioning to the maximum sediment concentration of the SRC.

3. Divide the estimated maximum leaching concentration by a calculated AOC-specific DAF in order to predict the groundwater concentration based on contaminant migration from the sediment to the surface water or groundwater.

4. Compare the predicted groundwater concentrations of the sediment SRCs with their respective MCLs or RSLs to determine the CMCOPCs.

Sediment samples were taken along the banks of drainage ditches located within the AOC. SRCs developed for sediment in Section 5.0 were screened by developing leachate concentrations assuming equilibrium between sediment and groundwater. The groundwater concentrations were diluted based on an AOC-specific DAF. Typically, AOC-specific DAFs are calculated where co-located surface water and sediment samples occur by dividing the calculated leachate concentration by the co-located surface water concentration. However, no co-located samples exist at the Building 1200 AOC. Therefore, a default DAF of 20 (USEPA 1996b) was used for dilution in the sediment screening analysis. Based on this screening analysis, there were no CMCOPCs in the sediment located in the drainage ditches within the AOC. Appendix E, Table E-8 presents results of the sediment screening analysis.

6.4 FATE AND TRANSPORT MODELING

Contaminant fate and transport modeling is performed for initial CMCOPCs based on the conceptual model for the AOC, as discussed in Section 6.2. SESOIL modeling was performed for chemicals identified as the initial CMCOPCs from the soil screening analyses presented in Section 6.3 and summarized in Table 6-1. The SESOIL modeling was performed to predict concentrations of chemicals in the leachate immediately beneath the selected source areas and just above the water table. If the predicted leachate concentration of a CMCOPC exceeded its MCL/RSL, facility-wide background concentration, and FWCUGs for AOC receptors, then the AT123D model was performed to predict the groundwater concentrations directly beneath the source and downgradient at designated receptor locations. The downgradient receptor location is the closest surface water body feature downgradient of the source areas.

6.4.1 Modeling Approach

Contaminant transport includes the movement of water and dissolved material from the source areas to groundwater. This occurs as rainwater infiltrates from the surface and percolates through the area of contamination, its surrounding soil, and into the saturated zone. The downward movement of water driven by gravitational potential, capillary pressure, and other components of total fluid potential, mobilizes the contaminants and carries them through the soil and shallow bedrock into the mixing zone with the water table. Lateral transport within the bedrock is controlled by the groundwater gradient. Vertical transport (evaluated with the SESOIL model) through the overburden to the water table, and horizontal transport (evaluated with the AT123D model) through the bedrock to the downgradient receptor locations are illustrated in Figure 6-1.

The output of the contaminant fate and transport modeling is presented as the expected maximum concentration of modeled contaminants at the selected receptor locations. For SESOIL, the receptor location is the groundwater table beneath the source area. For this analysis, three ISM sampling areas were considered as sources of contamination based on the results of the soil screening analysis. A

separate SESOIL analysis was performed for each initial CMCOPC listed in Table 6-1 and presented on Figure 6-2.

The predicted maximum leachate concentration just above the water table, observed in the SESOIL results, was compared against FWCUGs for the AOC-specific receptors, facility-wide background concentrations, and MCL/RSL. If the predicted maximum leachate concentration of an initial CMCOPC was higher than the FWCUGs, facility-wide background concentrations, and MCL/RSL, the CMCOPC was further evaluated using the AT123D model to predict future maximum concentrations in groundwater beneath the source, as well as at the receptor locations if applicable. If a predicted maximum leachate concentration was lower than at least one of these three screening goals, the chemical was no longer considered a CMCOPC. The predicted maximum concentration in groundwater directly below the source areas and at the receptor locations, observed in the AT123D results, was compared against the FWCUGs, facility-wide background concentrations, and MCL/RSL. If the predicted maximum concentration of a CMCOPC was higher than the FWCUGs, facility-wide background concentrations, and MCL/RSL, the chemical would be retained as a CMCOC. If a predicted maximum concentration in groundwater directly below the source areas and at the receptor location is lower than at least one of these three screening goals, the chemical is not a CMCOC.

6.4.2 Model Applications

The SESOIL model (GSC 1998) used for leachate modeling, when applicable, estimates pollutant concentrations in the soil profile following introduction via direct application and/or interaction with transport media. The AT123D model (DOE 1992) is an analytical groundwater pollutant fate and transport model. It computes the spatial-temporal concentration distribution of waste in the aquifer system and predicts the transient spread of a contaminant plume through a groundwater aquifer. The application of both of these models is discussed in the following subsections.

6.4.2.1 SESOIL Modeling

The SESOIL model defines the soil column as compartments extending from the ground surface through the unsaturated zone and to the upper level of the saturated soil zone or top of bedrock. Processes simulated in SESOIL are categorized in three cycles: the hydrologic cycle, sedimentation cycle, and pollutant cycle. Each cycle is a separate submodule in the SESOIL code. The hydrologic cycle includes rainfall, surface runoff, percolation, soil-water content, evapotranspiration, and groundwater recharge. The sediment washload cycle includes erosion and sediment transport. The pollutant cycle includes convective transport, volatilization, adsorption/desorption, and degradation/decay. A contaminant in SESOIL can partition in up to four phases (liquid, adsorbed, air, and pure).

Data requirements for SESOIL are not extensive and utilize a minimum of AOC-specific soil and chemical parameters and monthly or seasonal meteorological values as input. Output of the SESOIL model include pollutant concentrations at various soil depths and pollutant loss from the unsaturated soil zone in terms of surface runoff, percolation to groundwater, volatilization, and degradation. The

mathematical representations in SESOIL generally consider the rate at which the modeled processes occur, the interaction of different processes with each other, and the initial conditions of both the waste area and the surrounding subsurface matrix material.

The input data for SESOIL can be grouped into four types: climatic data, chemical data, soil data, and application data. There are a total of 61 separate parameters contained in these four data groups. Wherever possible, AOC-specific parameter values were used for the modeling. Certain parameters, however, were not available for the source areas, and were estimated based on pertinent scientific literature, geochemical investigations, and checks for consistency between model results and historical data. Conservative estimates were used when a range of values existed or parameter values were not available.

6.4.2.2 Climate Data

The climatic data file of SESOIL consists of an array of mean monthly temperature, mean monthly cloud cover fraction, average monthly relative humidity, reflectivity of the earth's surface (i.e., shortwave albedo), average daily evapotranspiration, monthly precipitation, mean number of storm events per month, mean duration of rainfall, and mean length of rainy season. The climatic data is presented in Table E-9 in Appendix E. This data was taken from the Youngstown Weather Service Office Air Port, Ohio, weather station as it was determined to be most appropriate, corresponding to the latitude and the longitude at RVAAP.

Climate data from Youngstown were used for the vertical transport analysis because the SESOIL model had coefficients for Youngstown stored within the SESOIL program. Climate data from Cleveland were used for the soil screening analysis because the HELP model had coefficients for Cleveland stored within the HELP program. Both programs produced virtually the same recharge rate (9.40 cm/year for Cleveland and 9.42 cm/year for Youngstown) for each location. Therefore, since the recharge rate was similar in both situations, the weather data stored within each program were used since the data were available.

6.4.2.3 Chemical Data

The pollutant fate cycle of SESOIL focuses on the various chemical transport and transformation processes that may occur in the soil zone. These processes include volatilization/diffusion, adsorption/desorption, cation exchange, biodegradation and hydrolysis, and metal complexation. The chemical-specific parameters are presented in Appendix E (Table E-10). The distribution coefficients (K_ds) for inorganic chemicals were obtained from the *Soil Screening Guidance: Technical Background Document* assuming a neutral pH of 7, unless stated otherwise (USEPA 1996b). The K_ds for organic chemicals were estimated from organic carbon-based water partition coefficients (K_{oc}) using the relationship $K_d = (f_{oc})(K_{oc})$, where f_{oc} = soil organic carbon content is the mass fraction obtained from AOC-specific measurements, and K_{oc} values were obtained from *Soil Screening Guidance: Technical Background Document* (USEPA 1996b), unless otherwise stated. In general,

biodegradation rates are not applicable for inorganic CMCOPCs, and biodegradation was not considered for the organic chemicals in this evaluation.

6.4.2.4 Soil Data

The soil data file of SESOIL contains input parameters describing the physical characteristics of the subsurface soil and is presented in Table 6-2. The parameters include soil bulk density, intrinsic permeability, soil disconnectedness index, soil porosity, organic carbon content, and cation exchange capacity. AOC-specific data were used from geotechnical samples collected at the AOC during the PBA08 RI (Table 5-8). There is, however, no measurement method for the soil disconnectedness index or a measured value of the Freundlich exponent. Soil disconnectedness index is a parameter that relates the soil permeability to the moisture content. Thus, SESOIL default values were used for these two parameters.

An average intrinsic permeability for the vadose zone representing the unconsolidated zone above the water table was calibrated using the percolation rate of 9.42 cm/year (3.6 inches/year) as the calibration target. The model was calibrated against the percolation rate by varying the intrinsic permeability and by keeping all other AOC-specific geotechnical parameters fixed. The final hydrogeologic parameter values used in this modeling are shown in Table 6-2. The soil porosity was set to the AOC-specific value. The intrinsic permeability, calibrated in SESOIL to the percolation rate (determined from a water balance estimated in HELP) was found to match the AOC-specific measurements from geotechnical samples.

Soil disconnectedness index replaces the moisture retention curves (or characteristic curves) used by other unsaturated zone leaching models. SESOIL User's Guide defines this parameter to be the exponent relating the “wetting” and “drying” time-dependent permeability of soil to its saturated permeability (Hetrick and Scott 1993). This “one variable” approach of using soil disconnectedness index in SESOIL simplifies the data estimation process and reduces computational time. In addition, this parameter was calibrated for four different soil types ranging from sandy loam to clay (Hetrick et al. 1986), and calibrated values fell within the default range specified in the SESOIL User's Guide.

Table 6-2. Unit Specific Parameters Used in SESOIL and AT123D Modeling

Parameters	Symbol	Units	Value	Source for Value
SESOIL				
Percolation Rate (Recharge Rate)	q	m/yr	9.42E-02	0.1 * SESOIL Precipitation for Youngstown, Ohio
Horizontal Area of Aggregate	A_p	sq. cm	Sample specific	Sample specific
Intrinsic Permeability - clayey sand	p	cm^2	8.20E-11	Calibrated from SESOIL model
Disconnectedness Index	c	unitless	10	Calibrated from SESOIL model
Freundlich Equation Exponent	n	unitless	1	SESOIL default
Fraction Organic Carbon	f_{oc}	unitless	1.20E-03	From the PBA08 RI geotechnical sample B12sb-029-5091-SO
Bulk Density	ρ_b	kg/L	1.63	
Moisture Content	w	wt %	22.5	
Water-filled Soil Porosity	θw	unitless	0.367	
Air-filled Soil Porosity	θa	unitless	0.00800	
Porosity - total	n_T	unitless	0.375	
Vadose Zone Thickness	Vz	m	2.74	Average based on ground surface elevations and depth to water table from Figure 3-1
Leaching Zone Thickness	Th	m	2.43	Average based on vadose zone thicknesses and results for CMCOPCs in soil
AT123D				
Aquifer Thickness	h	m	6	Facility-wide assumption for the unconsolidated aquifer presented the Load Line 1 investigation (USACE 2003a)
Hydraulic Conductivity in Saturated Zone	K_S	cm/s	5.70E-05	Slug test performed at the four monitoring wells at Building 1200 in January and February 2005
Hydraulic Gradient	i	unitless	1.80E-02	Average gradient determined from Figure 3-1
Effective porosity	n_e	unitless	0.2	Assumed for sandstone (USEPA 1985)
Dispersivity, longitudinal	α_L	m	30	Assumed
Dispersivity, transverse	α_T	m	3	0.1 α_L
Dispersivity, vertical	α_V	m	0.3	0.01 α_L

6.4.2.5 Source Terms

Analytical data from surface and subsurface soil collected at the AOC were used as source terms for SESOIL modeling. All the samples at different depth intervals were compiled to provide a detailed loading option for the SESOIL model. The samples with the maximum soil concentration for each CMCOPC listed in Table 6-1 were used as source term concentrations for the SESOIL model.

6.4.2.6 Application Data

Two layering schemes were developed for sample locations due to the varying thicknesses of the leaching zone based on the depth of soil sample concentrations. Each layering scheme consisted of four layers. The top layer of each model (Layer 1) was 1 ft thick (0.0-1.0 ft bgs), the second layer was 3 ft thick (1.0-4.0 ft bgs), the third layer was 4.5 ft thick (4.0-8.5 ft bgs), and the fourth layer was 0.5 ft thick (8.5-9.0 ft bgs) in all layering schemes. The layering scheme for the copper, TNT, HMX, naphthalene, and RDX models consisted of a 1.0 ft thick loading zone in Layer 1 and an 8.0 ft thick leaching zone in Layers 2 through 4. The layering scheme for the selenium model consisted of a 4.0 ft thick loading zone in Layers 1 and 2 and 5.0 ft thick leaching zone in Layers 3 and 4. The layers were divided into appropriate sub-layers, as this configuration resulted in contaminant loading at intervals close to the actual intervals sampled and represented by the analytical data. Layer 4 was included just above the water table to read output results at the water table/vadose zone interface. Details of the model layers utilized in this modeling are presented in Table E-11 in Appendix E.

6.4.3 SESOIL Modeling Results

SESOIL modeling was performed for initial CMCOPCs (copper, selenium, TNT, HMX, RDX, and naphthalene) that have the potential to reach the water table within 1,000 years based on the soil screening analysis results (Table 6-1). Table 6-3 presents the predicted peak leachate concentrations beneath the source areas relative to the sample area locations, and the corresponding time of the peak leachate concentrations. The FWCUGs, facility-wide background concentrations, and MCL/RSL values for the CMCOPCs are also shown in this table for comparison purposes. The maximum leachate concentrations of selenium, TNT, HMX, and RDX below the source and just above the water table exceeded their respective screening criteria. Therefore, selenium, TNT, HMX, and RDX were selected as final CMCOPCs for AT123D modeling. Copper and naphthalene were excluded as final CMCOPCs for further evaluation based on the results of the SESOIL modeling. Figures E-5 through E-10 in Appendix E show the leachate mass flux versus time plots generated by SESOIL for the final CMCOPCs. The detailed input and output files of the SESOIL modeling are provided on a CD ROM included in Attachment 1 of Appendix E.

Table 6-3. Summary of SESOIL Modeling Results

6.4.4 AT123D Modeling in the Saturated Zone

The fate and transport processes accounted for in the AT123D model include advection, dispersion, adsorption/retardation, and decay. This model can be used as a tool for estimating the dissolved concentration of a chemical in three dimensions in the groundwater resulting from a mass release over a source area (point, line, area, or volume source). The model can handle instantaneous, as well as continuous, source loadings of CMCOPC concentrations. AT123D is frequently used by the scientific and technical community to perform quick and conservative estimates of groundwater plume movement in space and time. SESOIL and AT123D are linked in a software package (RISKPRO) so that mass loading to the groundwater predicted by SESOIL can be directly transferred to AT123D. Therefore, AT123D was chosen to predict the maximum concentration of contaminants in groundwater after mixing with the leachate and the future concentrations for the contaminants in groundwater at the receptor locations.

The hydrogeologic parameter values used in this modeling are shown in Table 6-2. Most of the parameters presented in this table are AOC-specific values, unless otherwise indicated in the table. The chemical-specific parameters are presented in Appendix E (Tables E-1, E-2, and E-12). A discussion of model assumptions and limitations is presented in Section 6.4.6.

Selenium, TNT, HMX, and RDX were identified as the final CMCOPCs based on SESOIL results where the leachate concentration exceeded its screening criteria within the AOC. Figure 6-3 presents the locations of the soil samples where the final CMCOPCs exist. Figures E-11 through E-14 in Appendix E show the predicted concentration versus time curves based on AT123D for the final CMCOPCs. The detailed input and output of AT123D modeling is provided on a CD ROM included in Attachment 2 of Appendix E.

6.4.5 AT123D Modeling Results

AT123D modeling was performed for the final CMCOPCs (selenium, TNT, HMX, and RDX) using contaminant loading results from SESOIL. Results of AT123D modeling are shown in Table 6-4 as the predicted groundwater concentration beneath the source area and at the selected downgradient receptor location (i.e., tributary to the Mahoning River). Observed groundwater concentrations from AOC monitoring wells are included in Table 6-4; however, it should be noted that these wells may not exist near the sample location with the maximum concentration and should not be considered in direct correlation. The observed groundwater concentrations were added for comparison—not for screening criteria. The distance to the downgradient receptor was based on the distance along groundwater flow direction (Figure 3-1) to the closest surface water body from the ISM boundary or sediment sample location. The downgradient distance to the tributary to the Mahoning River was 4,120 ft.

The maximum predicted concentrations of selenium and RDX were predicted to exceed the screening criteria beneath the source area and were modeled to the downgradient receptor. The maximum predicted concentrations of TNT and HMX did not exceed the screening criteria below the source,

and they were eliminated as CMCOCs. The maximum predicted concentrations of the remaining final CMCOPCs (selenium and RDX) modeled to the downgradient receptor did not exceed the screening criteria at the downgradient receptor location, and they were eliminated as CMCOCs. Based on the fate and transport evaluation, all SRCs identified in the surface soil, subsurface soil, and sediment sample aggregates are eliminated as posing future impacts to groundwater. AOC-specific groundwater data shown in Table 6-4 provide confirmation of modeling results.

6.4.6 Limitations/Assumptions

In general, a conservative modeling approach was used, which may overestimate the contaminant concentration in the leachate for migration from observed soil concentrations. Listed below are important assumptions used in this analysis.

- The use of K_d and R_d to describe the reaction term of the transport equation assumes that an equilibrium relationship exists between the solid-phase and solution-phase concentrations, and that the relationship is linear and reversible.

- Since AOC-specific data are not available, the K_d values and K_{oc} values used in this analysis for all the CMCOPCs represent literature or calculated values and may not represent conditions at the AOC.

- The K_d for inorganic chemicals used here assumed a neutral pH of 7. The K_d for inorganic chemicals varies with pH; therefore, if AOC-specific pH measurements are greater than 7, the K_d and calculated screening parameters (such as the retardation factor) will deviate from those presented here.

- Flow and transport in the vadose zone is one-dimensional (i.e., only in the vertical direction).

- This modeling used the current soil concentrations that were collected approximately 65 years after historical operations were terminated at the AOC. Therefore it does not account for chemicals that have already leached to groundwater.

- Flow and transport are not affected by density variations.

- A realistic distribution of soil contamination is not considered. The maximum concentration value was used as the source term concentrations for SESOIL model layers, a highly conservative assumption that is expected to produce higher leachate concentrations for the CMCOPCs than the average condition. The horizontal distribution of soil contamination was assumed based on concentration levels from nearby sample locations as opposed to taking into account the entire area.

- The water budget represents an overall average rainwater recharge and assumes an even distribution of percolation in the modeled area. An average water balance assumes some areas will have higher or lower recharge based on the heterogeneity of the soil and varying topography.

The inherent uncertainties associated with using these assumptions must be recognized. K_d values are highly sensitive to changes in the major chemistry of the solution phase. Therefore, it is important that the values be measured or estimated under conditions that will represent as closely as possible those of the contaminant plume. Deviations from actual AOC-specific parameter values from assumed literature values may significantly affect contaminant fate predictions. It is also important to

note that the contaminant plume will change over time and will be affected by multiple solutes that are present at the AOC. The effects of heterogeneity and anisotropy are not addressed in these simulations.

The discrepancy between the contaminant concentrations measured in the field and the values predicted by the model could be investigated by performing sensitivity analyses on the model input parameters that have the most influence on the model predictions. These parameters are: (1) biodegradation rate constants for organic chemicals; (2) saturated hydraulic conductivity; (3) soil porosity; (4) fraction of soil organic carbon-content (f_{oc}) for organic chemicals; (5) K_d for inorganic chemicals; and (6) longitudinal, transverse, and vertical dispersivity values. Generally, higher biodegradation rates will produce lower concentrations, and lower rates will produce higher concentrations for organic chemicals without impacting the results of the inorganic chemicals. Higher hydraulic conductivity and dispersivity causes higher advection and dispersion, thereby producing lower peaks near the source area, but increasing the migration distance. The reverse will be true with lower hydraulic conductivity and dispersivity values. Higher f_{oc} values have similar effect on organic chemicals as higher K_d has on inorganic chemicals. They decrease the mobility of the chemicals as well as produce lower concentrations in groundwater.

6.5 SUMMARY AND CONCLUSIONS

Based on the results of the PBA08 RI sampling activities, inorganic SRCs and organic SRCs exist in surface soil, subsurface soil, and sediment at the AOC. These SRCs were further evaluated to determine if residual concentrations in sediment and soil are protective of groundwater.

Conclusions of the soil screening, sediment screening, leachate modeling, and groundwater modeling are as follows.

- Copper, selenium, TNT, HMX, RDX, and naphthalene were identified as initial CMCOPCs based on soil screening and travel time analyses (Table 6-1).

- There were no CMCOPCs in sediment based on the sediment screening analysis.

- Selenium, TNT, HMX, and RDX were identified as final CMCOPCs from the contaminant fate and transport modeling leachate modeling. Based on the results of the SESOIL modeling (Table 6-3), the maximum concentration for selenium, TNT, HMX, and RDX in leachate directly below the source and above the water table were above the respective screening criteria. Therefore, AT123D modeling was required to predict the maximum concentration of the final CMCOPCs in groundwater after mixing with the leachate.

- The maximum predicted concentrations of TNT and HMX did not exceed the screening criteria below the source area and were therefore eliminated as CMCOCs. The AT123D model predicted maximum concentrations of selenium and RDX were predicted to exceed the screening criteria beneath the source area, but did not exceed the screening criteria at the downgradient receptor

location (i.e., tributary to the Mahoning River). Observed groundwater concentrations at Building 1200 provide confirmation of modeling results.

Based on the sediment and soil screening analyses and fate and transport modeling, all SRCs found in the sediment, surface soil, and subsurface soil samples, and evaluated through the stepwise fate and transport screening evaluation presented here are eliminated as posing future impacts to groundwater.

7.0 RISK ASSESSMENT

7.1 DATA EVALUATION FOR HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENTS

The purpose of this data evaluation is to develop a set of chemical data suitable for use in the HHRA and ERA. Data were evaluated to establish data aggregates and identify a list of SRCs.

Section 5.1 includes a summary of available data. Data collected at the Building 1200 AOC were grouped (aggregated) by environmental medium (e.g., surface soil), EU, and sample type (i.e., discrete or ISM). Samples included in the risk assessment datasets for surface soil, deep surface soil, subsurface soil, surface water, and sediment are listed in Tables 7-1 through 7-4. A description of the data aggregates for the media for which human and ecological receptors are potentially exposed is provided in Section 7.1.1, followed by a summary of SRCs in Section 7.1.2.

7.1.1 Data Aggregates

7.1.1.1 Soil Data

The Building 1200 AOC is evaluated as a single EU. Evaluation as a single EU is appropriate for the current land use and RAFLU at this AOC (i.e., National Guard Training; see Section 7.2.3) because a trainee could potentially move across the entire area during training. Although the Building 1200 AOC is considered a single EU, soil data within the Building 1200 EU were aggregated by the following depth intervals since different future receptors are assumed to be exposed to soil at different depths.

- Surface soil is defined as 0-1 ft bgs (shallow surface soil) for the Resident Farmer (Adult and Child) receptor. This depth interval is also most appropriate for evaluating potential risk to ecological receptors because that layer is the most active biological zone (USACE 2003c). For this risk assessment, shallow surface soil ISM samples collected in November and December 2004 for the Characterization of 14 AOCs and February 2010 for the PBA08 RI, were used to characterize surface soil. Older discrete shallow surface soil samples collected in 1996 for the Phase I Remedial Investigation of High-Priority Areas of Concern (USACE 1998) were not used in the risk assessment. The 1996 data were excluded because more recent ISM data collected from approximately the same locations adequately characterize the AOC and are more representative of current AOC conditions. The 1996 data not included in the risk assessment were used in the characterization of nature and extent of contamination (Section 5.0) to evaluate trends over time.

- Deep surface soil is defined as 0 to 4 ft bgs for the National Guard Trainee; however, no samples are available below 3 ft bgs due to the presence of shallow bedrock. Because the upper (0-1 ft bgs) portion of this interval was characterized using ISM sampling and the deeper (1-3 ft bgs) portion of this interval was characterized using discrete samples from soil borings, these two intervals were evaluated separately. That is, the same 0-1 ft ISM data were used for the National

Guard Trainee and Resident Farmer Receptors, and 1-3 ft bgs discrete data were also evaluated for the National Guard Trainee to account for exposure of this receptor to the 0-4 ft deep surface soil interval. It is inappropriate to combine the ISM and discrete sample data due to different levels of variability in these two data types.

- Subsurface soil is defined as 1-13 ft bgs for the Resident Farmer; however, bedrock is present at 3 ft bgs. Therefore, there is no soil exposure below 3 ft bgs. Discrete soil data from 1-3 ft bgs were used to evaluate subsurface soil for this receptor. Subsurface soil is defined as 4-7 ft bgs for the National Guard Trainee. Shallow bedrock precludes the collection of subsurface samples at this depth; therefore, subsurface soil was not evaluated for this receptor. Subsurface soil is not appropriate for evaluating potential risk to most ecological receptors (USACE 2003c).

Samples included in the risk assessment datasets for soil are listed in Tables 7-1 (Surface Soil) and 7-2 (Deep Surface Soil and Subsurface Soil).

Table 7-1. Risk Assessment Dataset for Surface Soil (0-1 ft bgs): ISM Samples

Location	Sample ID	Date	Depth (ft bgs)

[a]Chromium speciation samples used to evaluate the presence of hexavalent chromium. B12ss-033 collected at ISM area B12ss-022M; B12ss-034 collected at ISM area B12ss-017M; B12ss-035 collected at ISM area B12ss-015M.
bgs = below ground surface
ISM = Incremental Sampling Methodology

Table 7-2. Risk Assessment Dataset for Deep Surface Soil and Subsurface Soil: Discrete Samples

Location	Sample ID	Date	Depth (ft bgs)
B12sb-027	B12sb-027-5084-SO	02/23/10	1 - 3
B12sb-028	B12sb-028-5088-SO	02/23/10	1 - 3
B12sb-030	B12sb-030-5094-SO	02/23/10	1 - 2.8
B12sb-031	B12sb-031-5098-SO	02/23/10	1 - 1.8
B12sb-032	B12sb-032-5102-SO	02/23/10	1 - 2.8

Deep surface soil is defined as 0-4 ft bgs for National Guard Trainee. Because samples were collected using ISM for 0-1 ft bgs and discrete sampling method for 1-3 ft these intervals were evaluated separately.
Subsurface soil is defined as 1-13 ft bgs for Resident Farmer. No samples were collected below 3 ft bgs due to the presence of shallow bedrock.
bgs = below ground surface
ISM = Incremental Sampling Method

7.1.1.2 Surface Water and Sediment Data

Surface water at the Building 1200 AOC is limited to the former settling pond and the drainage ditch leading to the former settling pond (Figure 5-6) and is evaluated as a single EU. One other drainage feature (the discharge area from the former settling pond) is generally dry except following a precipitation event; therefore, surface water exposure was not evaluated at the discharge area.

Surface water and sediment samples collected in November 2004 during the Characterization of 14 AOCs and sediment samples collected in February 2010 during the PBA08 RI were used to characterize risks from exposure to chemicals in these media. Two discrete surface water samples and two ISM sediment samples were collected in 2004, one from the drainage ditch leading to the former settling pond and one from within the former settling pond. Additionally, PBA08 RI sampling included a soil boring located in the former settling pond. Because water was present at the time of sampling, the top 0-1 ft bgs interval of this boring was classified as sediment and was included in the evaluation.

Samples included in the risk assessment datasets for surface water and sediment are listed in Tables 7-3 (surface water) and 7-4 (sediment). The small sizes of the surface water and sediment datasets are reflective of the small sizes of these EUs.

Table 7-3. Risk Assessment Dataset for Surface Water

Location	Sample ID	Date
B12sw-025	B12sw-025-SW	11/5/2004
B12sw-026	B12sw-026-SW	11/5/2004

Table 7-4. Risk Assessment Dataset for Sediment

Location	Sample ID	Date	Depth (ft bgs)	Type
B12sb-031	B12sb-031-5097-SO	2/23/2010	0-1	D
B12sd-023M	B12sd-023M-SD	11/5/2004	0-0.5	ISM
B12sd-024M	B12sd-024M-SD	11/5/2004	0-0.5	ISM

bgs = below ground surface
Sample Type: D = discrete, ISM = Incremental Sampling Methodology

Discrete sediment samples collected from the drainage ditch leading to the former settling pond in 1996 during the Phase I RI for High-Priority AOCs were not included in the risk assessment because a more recent ISM sample (B12sb-024M) is available from the same location.

7.1.2 Identification of SRCs

Section 5.1 presents the statistical methods and screening criteria used to identify SRCs present at concentrations that indicate potential impacts related to historical operations within the AOC. The purpose of the identification of SRCs is to determine the presence or absence of contamination that is site-related and is above naturally-occurring levels. The SRC screen followed the three steps outlined in the FWCUG Report and is summarized below:

- Background screening: The MDC of naturally-occurring inorganic chemicals were compared to the facility-wide background concentrations for RVAAP, originally published in the *Phase II Remedial Investigation Report for Winklepeck Burning Grounds* (USACE 2001b) and summarized in the FWCUG Report. Inorganic chemicals detected above background screening values (BSVs) or having no BSVs were retained as SRCs.

- Screening of essential human nutrients: Chemicals considered essential nutrients (e.g., calcium, chloride, iodine, iron, magnesium, potassium, phosphorous, and sodium) are an integral part of the human food supply and are often added to foods as supplements USEPA recommends these chemicals not be evaluated so long as they are: (1) present at low concentrations (i.e., only slightly elevated above naturally occurring levels) and; (2) toxic at very high doses (i.e., much higher than those that could be associated with contact at the AOC) (USEPA 1989). Essential nutrients detected near or below their RDA/RDI-based screening levels were eliminated as SRCs.

- Frequency of detection screening: The FWCUG Report allows for screening based on frequency of detection, where, except for explosives and propellants, analytes detected in less than 5% of the samples can be screened out from further consideration. However, for this AOC no frequency-of-detection screening was performed for soil, surface water, or sediment because fewer than 20 discrete samples were available for these datasets. Frequency of detection screening was not used for ISM samples.

Details of the SRC screening for each exposure medium are provided in Tables 5-4 (surface soil), 5-6 (subsurface soil), 5-10 (sediment), and 5-12 (surface water) and Appendix G Tables G-1 through G-5. The SRCs identified for the Building 1200 AOC are summarized in Table 7-5 below.

Table 7-5. Summary of SRCs

X = chemical is an SRC in this medium
-- = chemical is not an SRC in this medium

7.2 HUMAN HEALTH RISK ASSESSMENT

This HHRA documents the COCs that may pose potential health risks to humans resulting from exposure to contamination at the Building 1200 AOC. This HHRA was conducted as part of the PBA08 RI and is based on the methods from the FWCUG Report as described below.

Recently, the RVAAP project team (i.e., Ohio EPA and USACE Louisville District) proposed an approach for efficient risk-based decision making at RVAAP that incorporates past experience gained through previously completed work. To accomplish this goal of streamlined risk-based decision making, the FWCUG Report was developed to support the environmental remediation of the remaining AOCs at RVAAP to complete final transfer of the land to OHARNG. The FWCUG Report contains calculated FWCUGs and guidance for their application to accelerate the decision-making process for the remaining AOCs, taking advantage of the many risk assessment inputs and decisions for the facility that have been agreed to by stakeholders through the application of the CERCLA process over the past 10 years. Most of the agreed-to risk assessment methods have been documented in the FWHHRAM and follow standard USEPA-approved risk assessment guidance. This includes the Process to Identify RVAAP Chemicals of Potential Concern (presented in Figure 5-1), the use of a TR of 1E-06 and HQ of 0.1 to identify COPCs, and the use of a TR of 1E-05 and HQ of 1.0 to identify COCs.

The approach to risk-based decision-making is as follows (USACE 2010a):

1. Using the risk assessment process presented in the FWHHRAM (and included in the White Paper provided in Appendix A of the FWCUG Report), develop FWCUGs for all COPCs identified from the facility-wide dataset at RVAAP.

2. Perform RI characterization sampling and analysis to establish the baseline chemical concentrations within an AOC.

3. Perform data analysis and mapping to identify SRCs and COPCs following the process presented in Figure 5-1 (Figure 1-2 in the FWCUG Report). Determine EUs and calculate exposure point concentrations (EPCs) for each COPC, following the requirements for performing these tasks as spelled out in the FWHHRAM and further clarified in the position paper developed by USACE provided in Appendix B of the FWCUG Report (USACE 2010a).

4. Compare EPCs to the FWCUGs to determine COCs.

5. Perform the FS, PP, and ROD to address any identified COCs.

Step 1 of this process (develop FWCUGs) has been completed in the FWCUG Report. The results of Step 2 (RI characterization sampling) and Step 3 (mapping and data analysis to identify SRCs) are presented in Sections 4.0 and 5.0 of this PBA08 RI report and are summarized in Section 7.1.

The remainder of Step 3 (identification of COPCs) and Step 4 (determine COCs) are provided in the following subsections and follow the 4 steps for a streamlined risk assessment (also shown in Figure 1-3): identify media of concern (Section 7.2.1); identify COPCs (Section 7.2.2); determine AOC land use and appropriate receptors (Section 7.2.3); and compare to appropriate FWCUGs to identify COCs (Section 7.2.4).

7.2.1 Identify Media of Concern

Media of concern at the Building 1200 AOC are surface soil, subsurface soil, surface water, and sediment as defined in Section 7.1.1. Groundwater is present at this AOC and will be evaluated (including risk assessment) in a separate document, as described in Section 1.2.

7.2.2 Identify COPCs

Section 5.1 presents the statistical methods and screening criteria used to identify SRCs. COPCs were identified here as a subset of the SRCs identified in Section 5.0 and summarized in Section 7.1.2, in each exposure medium, present at concentrations that indicate potential impacts to human receptors. The COPC screen follows the approach specified in the FWCUG Report and is summarized here.

For the determination of COPCs, the MDC of all SRCs was screened against the chemical-specific FWCUGs at a target cancer risk level of 1E-06 and non-carcinogenic target HQ of 0.1 for the Resident Farmer Adult, Resident Farmer Child, and the National Guard Trainee. If no FWCUGs existed for an SRC, the USEPA residential RSL (from RSL table dated May 2010) was used for this screen. No reference dose or cancer potency factors are available for acenaphthylene, benzo(ghi)perylene, and phenanthrene; therefore, the RSL for pyrene was used for these PAHs (NDEP 2006). Hexavalent chromium was detected in 1 of 3 speciation samples at the Building 1200

AOC; therefore, as part of the conservative screening approach for identifying COPCs, the FWCUG for hexavalent chromium (the more toxic of the 2 chromium species evaluated) is used at this stage.

Details of the COPC screening for each exposure medium are provided in Appendix G Tables G-1 (shallow surface soil), G-2 (deep surface soil), G-3 and G-4 (sediment), and G-5 (surface water). These tables include all carcinogenic and non-carcinogenic risk-based FWCUG or RSL values for each chemical. SRCs were identified as COPCs if the MDC exceeds the most protective (i.e., lowest) FWCUG. The COPCs identified for the media of concern at the Building 1200 AOC are presented in Table 7-6 and summarized below.

7.2.2.1 COPCs in Surface Soil

Surface soil is defined as 0-1 ft bgs (shallow surface soil) for the Resident Farmer (Adult and Child) receptor (USACE 2010a). For this risk assessment, shallow surface soil ISM samples collected in 2004 and 2010 were used to characterize surface soil. Deep surface soil is defined as 0-4 ft bgs for the National Guard Trainee. Because the upper (0-1 ft bgs) portion of this interval was characterized using ISM sampling and the deeper (1-3 ft bgs) portion of this interval was characterized using discrete samples from soil borings, these two intervals were evaluated separately.

Forty-one chemicals were detected in shallow surface soil (0-1 ft bgs) ISM samples, 32 of these chemicals (14 inorganic chemicals, 14 SVOCs, 1 VOC, and 4 explosives) were identified as SRCs. Risk-based screening identified 6 COPCs in shallow surface soil: 4 inorganic chemicals (aluminum, chromium, cobalt, and manganese), 1 explosive (RDX), and 1 SVOC [benzo(a)pyrene].

Twenty-six chemicals were detected in deep surface soil discrete samples; 9 of these chemicals (5 inorganic chemicals, 2 SVOCs, 1 VOC, and 1 explosive) were identified as SRCs. Risk-based screening identified arsenic as the only COPC in deep surface soil.

Chromium was identified as an SRC in shallow surface soil but not deep surface soil at the Building 1200 AOC. Chromium was not identified as an SRC in deep surface soil because the MDC of chromium in deep surface soil (21 mg/kg) is less than the background concentration (27.2 mg/kg). The MDC of total chromium in surface soil at the Building 1200 AOC (36.1 mg/kg) is greater than the lowest screening value for hexavalent chromium of 1.64 mg/kg; therefore, total chromium was retained as a COPC for surface soil.

7.2.2.2 COPCs in Subsurface Soil

Subsurface soil is defined as 1-13 ft bgs for the Resident Farmer; however, due to the lack of soil below 3 ft bgs, soil from 1-3 ft bgs was used to evaluate subsurface soil for this receptor. Thus, the same dataset of 5 discrete soil samples were used to characterize deep surface soil for the National Guard Trainee and subsurface soil for the Resident Farmer. As noted above for deep surface soil, risk-based screening identified arsenic as the only COPC in subsurface soil.

Subsurface soil is defined as 4-7 ft bgs for the National Guard Trainee. Shallow bedrock precluded the collection of subsurface samples at this depth; therefore, subsurface soil was not evaluated for this receptor.

7.2.2.3 COPCs in Sediment

Twenty-seven chemicals were detected in sediment ISM samples collected at the former settling pond and drainage ditch leading to the former settling pond; 13 of these chemicals (7 inorganic chemicals, 1 explosive, 2 SVOCs, 2 VOC, and 1 pesticide) were identified as SRCs. Twenty-one chemicals were detected in the discrete sediment sample collected at the former settling pond, 5 inorganic chemicals were identified as SRCs. Risk-based screening identified three inorganic chemicals as COPCs in sediment: aluminum in the ISM samples, and chromium and cobalt in the discrete samples.

Chromium was identified as an SRC in sediment. The MDC for total chromium in sediment ISM samples (18 mg/kg) is approximately equal to the sediment background concentration (18.1 mg/kg) for this inorganic chemical. The reported concentration of total chromium in the discrete sediment sample from the former settling pond (20.2 mg/kg) is greater than the lowest screening value for hexavalent chromium of 1.64 mg/kg; therefore, total chromium was identified as a COPC for sediment.

7.2.2.4 COPCs in Surface Water

Twenty-four chemicals were detected in surface water samples collected at the former settling pond and drainage ditch leading to the former settling pond; 17 of these chemicals (5 inorganic chemicals, 4 explosives, 6 SVOCs, and 2 VOCs) were identified as SRCs. Risk-based screening identified 4 COPCs in surface water: manganese, 3-nitrotoluene, RDX, and bis(2-ethylhexyl)phthalate.

Table 7-6. Summary of COPCs

COPC	Surface Soil[a] (0-1 ft bgs)	Deep Surface and Subsurface Soil[b] (1-3 ft bgs)	Sediment	Surface Water
Inorganic chemicals

RDX= hexahydro-1,3,5-trinitro-1,3,5-triazine
SVOC = Semi-volatile Organic Compound
VOC = Volatile Organic Compound
X = chemical is a COPC in this medium
-- = chemical is not a COPC in this medium

7.2.3 Determine AOC Land Use and Appropriate Receptors

The Building 1200 AOC encompasses approximately 7.7 acres and was formerly the Ammunition Sectioning Area (Figure 2-1). From 1941 to 1971, the AOC was used for ammunition demilitarization, which consisted of disassembly and removal of explosive charges using a steam melt-out process. The steam generated pink water which discharged into a drainage ditch connected to a 0.5-acre settling pond. Overflow from the settling pond discharged directly to ground surface southeast of the pond. All buildings and structures were demolished and removed in August 2005. Currently the AOC is a sparsely vegetated area, consisting only of the drainage ditch from the former buildings to the former settling pond, former settling pond, and discharge area from the former settling pond. The drainage ditch and former settling pond were not backfilled or re-graded during demolition activities and remain in their original form.

The area immediately surrounding the Building 1200 AOC is forested with the exception of three areas: (1) the access road (Ammunition Sectioning Road); (2) a small clearing around the former building footprints; and (3) the former settling pond. Storm water runoff from former operational areas within the AOC flows to the east. The closest surface water, a tributary of Sand Creek, is located approximately 1300 ft south of the former operation areas. Remalia Road is located approximately 2000 ft to the southeast. Randall Road is located approximately 1500 ft to the east.

RVAAP is a controlled-access facility that is fenced and patrolled by security personnel. The Building 1200 AOC, located in the eastern portion of RVAAP, is currently inactive. Full-time OHARNG, BRAC, and contractor staff work at the facility. Military training and operations are conducted at the facility. The OHARNG projected future land-use for the AOC is Military Use and Training. The most representative receptor is the National Guard Trainee and, per the FWHHRAM,

this constitutes the Risk Assessment Land Use of Dismounted Training-Digging. National Guard Training, in conjunction with the evaluation of agricultural-residential land uses and associated receptors, form the basis for identifying COCs. Residential Land Use, specifically the Resident Farmer receptor, is included to evaluate COCs for unrestricted land use at the AOC, as required by the CERCLA process and as outlined in the FWHHRAM (USACE 2005a).

7.2.4 Compare to Appropriate FWCUGs

Previous sections have outlined the process for identifying SRCs (Section 7.1.2) and COPCs (Section 7.2.2). The comparison to FWCUGs and determination of COCs follows guidance presented in Appendix B of the FWCUG Report. The screening process is as follows:

- Select the FWCUGs corresponding to a TR of 1E-05 and target HQ of 1.0 for: (1) the planned National Guard end-use (i.e., National Guard Trainee); and (2) the Resident Farmer Adult and Child receptors to evaluate an unrestricted land use scenario.

- Report all carcinogenic and non-carcinogenic based FWCUGs for each COPC for all appropriate receptors (i.e., National Guard Trainee and Resident Farmer Adult and Child).

- Report critical effect and target organ for each of the non-carcinogenic based FWCUGs.

- Complete a comparison of the selected FWCUG to the EPC including a sum-of-ratios (SOR).
  - For non-carcinogens, compare the EPC to the target HQ FWCUG. Sum the ratios of EPC/FWCUG for COPCs that affect similar target organs.
  - For carcinogens, compare the EPC to the TR FWCUG. Sum the ratios of EPC/FWCUG for all carcinogens.

- The COPC is identified as a COC for a given receptor:
  - If the EPC exceeds the more protective FWCUG for either the 1E-05 target cancer risk or the 1.0 target HQ; or
  - If the SOR for all carcinogens or all non-carcinogens that may affect the same organ is greater than 1. Chemicals contributing at least 10% to the SOR were also considered COCs.

The process for calculating FWCUGs is a rearrangement of the cancer risk or non-cancer hazard equations, with the goal of obtaining the concentration that will produce a specific risk or hazard level. For example, the FWCUG for arsenic at the cancer risk level of 1E-05 for the National Guard Trainee is the concentration of arsenic that produces a risk of 1E-05 when using the exposure parameters specific to the National Guard Trainee receptor. Exposure parameters used to calculate FWCUGs for the receptors evaluated for the Building 1200 AOC are presented in Appendix G, Table G-6.

For carcinogens, risk is expressed as the probability that an individual will develop cancer over a lifetime as a result of exposure to the carcinogen. Cancer risk from exposure to contamination is expressed as the increased chance of cancer above the normal background rate of cancer. In the United States, the background chance of contracting cancer is a little more than 3 in 10, or 3E-01

(American Cancer Society 2003). The calculated incremental lifetime cancer risks (ILCRs) are compared to the range specified in the NCP of 10-6 to 10-4, or 1 in one million to 1 in 10,000 exposed persons developing cancer (USEPA 1990). Cancer risks below 10-6 are considered acceptable; cancer risks above 10-4 are considered unacceptable. The range between 10-6 and 10-4 is of concern, and any decisions to address risks further in this range, either through additional study or engineered control measures, should account for the uncertainty in the risk estimates. The Ohio EPA Division of Environmental Response and Revitalization (DERR) Remedial Response program has adopted a human health cumulative ILCR goal within this range of 1E-5 to be used as the level of acceptable excess cancer risk and for the development of remediation goals for a site. The DERR notes the defined risk goal should be applied as a goal, recognizing the need to retain flexibility during the evaluation and selection of remedial alternatives.

In addition to developing cancer from exposure to chemicals, an individual may experience other toxic effects. The term "toxic effects" is used here to describe a wide variety of systemic effects ranging from minor irritations, such as eye irritation and headaches, to more substantial effects, such as kidney or liver disease and neurological damage. The risks associated with toxic (i.e., non-carcinogenic) chemicals are evaluated by comparing an estimated exposure (i.e., intake or dose) from AOC media to an acceptable exposure expressed as a reference dose (RfD). The RfD is the threshold level below which no toxic effects are expected to occur in a population, including sensitive subpopulations. The ratio of intake over the RfD is the HQ (USEPA 1989).

The SOR is used to account for the potential additive effects from exposure to multiple chemicals that can cause the same effect (e.g., cancer) or affect the same target organ. Cancer risk is assumed to be additive for all carcinogens. Non-cancer risk is assumed to be additive for chemicals with similar sites of toxicological action (i.e., target organ such as liver or critical effect such as adversely effecting the ability to reproduce). This approach compares the EPC of each COPC to the FWCUG to determine a ratio. The sum of these individual ratios is then compared to 1. The SOR method is based on the principle that a ratio greater than 1 represents unacceptable cumulative exposure (i.e., above FWCUGs if adjusted for exposure to multiple COPCs), and a ratio less than or equal to 1 represents acceptable cumulative exposure (i.e., below FWCUGs if adjusted for exposure to multiple COPCs). The FWCUGs for some chemical/receptor combinations are less than the background concentration. In these instances the chemical concentrations are compared to background concentrations for identification of COCs. Since the background concentration is not risk-based, these chemicals are not included in the SOR calculations.

The COCs identified by the comparison of EPCs to FWCUGs are further evaluated in an uncertainty analysis to identify COCs requiring evaluation in the FS.

The selection of FWCUGs, calculation of EPCs for comparison to the FWCUGs, and resulting risk-based COCs are detailed in the following sections.

7.2.4.1 Selection of Appropriate FWCUGs

The land use/receptor combination for selecting FWCUGs for the Building 1200 AOC evaluation is the National Guard Trainee. FWCUGs were identified for soil, surface water, and sediment. In addition to this planned OHARNG land use, the Resident Farmer Adult and Child Receptor FWCUGs were used to evaluate an unrestricted scenario.

FWCUGs for these receptors from the FWCUG Report (USACE 2010a) are provided in Tables 7-7 (soil and sediment) and 7-8 (surface water) for all COPCs. The critical effect or target organ associated with the toxicity values used to calculate the FWCUGs are also provided in these tables.

Table 7-7. FWCUGs Corresponding to an HQ of 1.0 and Target Risk of 1E-05 in Soil and/or Sediment

COPC	Critical Effect or Target Organ	FWCUG (mg/kg)			
		National Guard Trainee		Resident Farmer[a]	
		HQ = 1.0	TR = 1E-05	HQ = 1.0	TR = 1E-05
Aluminum	Neurotoxicity in offspring	34960	--	73798	--
Arsenic	Skin	1140	27.8[c]	20.2	4.25[d]
Chromium, hexavalent[b]	Stomach, liver/kidney	56.1	16.4	199	1874
Chromium, trivalent	NOAEL	1,000,000	--	81,473	--
Cobalt	NS	140	70.3	1313	8030
Manganese	CNS	351[cd]	--	2927	--
Benzo(a)pyrene	NA	--	4.77[c]	--	0.221
RDX	NA	17113	1452	227	115

[a]Resident Farmer FWCUGs are the smaller of the Adult or Child values for each COPC and endpoint (non-cancer and cancer).
[b]FWCUG for hexavalent chromium was calculated using a cancer URF developed for a chromate mixture consisting of 1/7 hexavalent chromium and 6/7 trivalent chromium.
[c]FWCUG values are less than precedent CUG values for the National Guard Trainee for arsenic (31 mg/kg), manganese, (1800 mg/kg) and benzo(a)pyrene (10 mg/kg) published in the *Interim Record of Decision for the Remediation of Soils at Load Lines 1 through 4* (USACE 2007a), *Record of Decision for Soil and Dry Sediment for Load Line 12* (USACE 2009b), and/or *Record of Decision for Soil and Dry Sediment at the Fuze and Booster Quarry Landfill/Ponds* (USACE 2007b).
[d]FWCUG values are less than the background screening values for arsenic in surface soil (15.4 mg/kg), subsurface soil (19.8 mg/kg) and sediment (19.5 mg/kg) and for manganese in surface soil (1450 mg/kg), subsurface soil (3030 mg/kg), and sediment (1950 mg/kg).CNS = Central Nervous System
COPC = Chemical of Potential Concern
CNS = Central Nervous System
FWCUG = Facility-Wide Cleanup Goal
HQ = Hazard Quotient
NA = Not applicable
NOAEL = No Observable Adverse Effect Level
NS = Not specified
TR = Target Risk
URF = Unit Risk Factor
-- = No value available

Table 7-8. FWCUGs Corresponding to an HQ of 1.0 and Target Risk of 1E-05 in Surface Water

COPC	Critical Effect or Target Organ	FWCUG (mg/L)			
		National Guard Trainee		Resident Farmer[a]	
		HQ = 1.0	TR = 1E-05	HQ = 1.0	TR = 1E-05

COPC = Chemical of Potential Concern
FWCUG = Facility-Wide Cleanup Goal
HQ = Hazard Quotient
NOAEL = No Observable Adverse Effect Level
TR = Target Risk
-- = No value available

FWCUGs are available for both hexavalent chromium and trivalent chromium. Existing historical data at other AOCs indicates chromium exists predominantly in the trivalent state, rather than the more toxic hexavalent state. To determine whether the FWCUG for trivalent or hexavalent chromium is most applicable to the Building 1200 AOC and to support risk management decisions, three discrete surface soil samples were collected and analyzed for hexavalent chromium and total chromium per the PBA08 SAP, as described in Sections 4.1.1 and 5.1.2. Two samples were collected from areas previously identified as having elevated total chromium concentrations and one was collected from an area identified as having chromium concentrations near background concentrations. This process has been approved and was documented in the *Remedial Investigation Report Addendum No. 1 for the RVAAP-49 Central Burn Pits* (USACE 2008). No hexavalent chromium was detected in 2 of the 3 samples. Hexavalent chromium was detected in the third sample at an estimated (J qualified, less than the laboratory reporting limit) concentration of 0.39 mg/kg. Identification of the appropriate FWCUGs for evaluating chromium results is based on evaluation of the following lines of evidence:

- **Calculation of the percent hexavalent chromium in the chromium speciation samples** - The FWCUG for hexavalent chromium is based on a cancer unit risk factor (URF) calculated using a chromium mixture containing 14% hexavalent chromium and 86% trivalent chromium. The three chromium speciation samples at the Building 1200 AOC contained no detectable hexavalent chromium in two of the samples and 2.4 % in one sample. These results are below the 14% hexavalent chromium used as the basis for the cancer URF, which was used to calculate the hexavalent chromium FWCUGs.

- **Comparison of the concentration of hexavalent chromium detected in the chromium speciation samples to a FWCUG adjusted to represent only hexavalent chromium** - The most protective FWCUG for hexavalent chromium is for the National Guard Trainee (16.4 mg/kg) and is calculated from a cancer URF based on a chromium mixture containing one-seventh (14%) hexavalent chromium (USEPA 2010b). Since the study used as the basis for the cancer URF included workers exposed to both trivalent and hexavalent chromium, the FWCUG must be adjusted to represent only hexavalent chromium for comparison to hexavalent chromium

results in the speciation samples. The toxicological review of hexavalent chromium written in support of summary information on the USEPA's Integrated Risk Information System (IRIS), states the risk of hexavalent chromium is estimated on the basis of the total chromium obtained from all soluble and insoluble chromium to which workers were exposed. Since there are likely differences between the chromium compounds to which workers were exposed, the potency of hexavalent chromium compounds may be underestimated. However, since the maximum ratio of trivalent chromium to hexavalent chromium reported in the worker studies is six, the underestimation of the risk for hexavalent chromium is unlikely to be greater than sevenfold (USEPA 1998b). Therefore, one-seventh of the National Guard Trainee FWCUG (16.4/7=2.3 mg/kg) is appropriate for evaluation of hexavalent chromium alone. The single detected concentration of hexavalent chromium in the chromium speciation samples (0.39 mg/kg) is less than 2.3 mg/kg, indicating hexavalent chromium is not present above the hexavalent chromium FWCUG.

- **Comparison of the concentration of total chromium to the FWCUG for trivalent chromium** - Hexavalent chromium is present at a very low concentration (i.e., below the FWCUG for hexavalent chromium alone), and the percent hexavalent chromium is less than 14%; therefore, hexavalent chromium is not of concern at the Building 1200 AOC, and the reported concentrations of total chromium were compared to the FWCUGs for trivalent chromium for identifying COCs at this AOC.

7.2.4.2 Exposure Point Concentrations for Comparison to FWCUGs

The EPCs were generated for each exposure medium for all COPCs to provide representative concentrations that a receptor could contact during the period of exposure. Details of the EPC calculations for each medium and sample type are described below.

Soil EPCs

Soil data at the Building 1200 AOC were aggregated into surface and subsurface soil as described in Section 7.1. Based on AOC characteristics and the operational constraints during its use, the sample coverage to define nature and extent of operationally impacted areas of the AOC is adequate.

For shallow surface soil (0-1 ft bgs), the EPC was the detected concentration in each ISM sample collected.

For deep surface soil (1-3 ft bgs), the EPC was calculated following the method and equations provided in the FWHHRAM from the results of all of the discrete samples collected from this depth at the Building 1200 AOC (listed in Table 7-2). The EPC was either the 95% upper confidence limit (UCL) of the mean or the MDC, whichever value is lowest. If the 95% UCL cannot be determined, the EPC is the MDC.

Subsurface soil is defined as 1-13 ft bgs for the Resident Farmer; however, due to the lack of soil below 3 ft bgs, the 1-3 ft bgs interval was used to evaluate subsurface soil for this receptor. Thus, the same EPCs were used for the National Guard Trainee deep surface soil and Resident Farmer subsurface soil evaluations.

Subsurface soil is defined as 4-7 ft bgs for the National Guard Trainee. Shallow bedrock precludes the collection of subsurface samples at this depth; therefore, subsurface soil was not evaluated for this receptor.

Sediment EPCs

One discrete and two ISM sediment samples collected from the former settling pond and drainage ditch in 2004 and 2010 were used to characterize risks from exposure to sediment. For the ISM samples, the EPC was the detected concentration in each of the two sediment ISM samples collected at the Building 1200 AOC. For the discrete sample, the EPC was the detected concentration.

Surface Water EPCs

Surface water was limited to the former settling pond and associated drainage ditch. Two discrete surface water samples collected from the former settling pond and drainage ditch in 2004 (MKM 2007) were used to characterize risks from exposure to surface water. The EPC was the MDC because a 95% UCL cannot be determined for two samples.

7.2.4.3 Identification of COCs: National Guard Trainee

National Guard Trainee COCs for Soil

COC screening for the shallow surface soil interval (0-1 ft bgs) for the National Guard Trainee receptor is detailed in Appendix G, Tables G-7 (screening against receptor-specific FWCUGs) and G-8 (SOR for carcinogens). COC screening for the deeper surface soil interval (1-3 ft bgs) for the National Guard Trainee receptor is detailed in Appendix G, Table G-9 (screening against receptor-specific FWCUGs). Soil COCs for the National Guard Trainee are summarized below and in Table 7-9.

Manganese was the only soil COC identified in ISM shallow surface soil (0-1 ft bgs) samples for the National Guard Trainee. Manganese was identified as a COC in shallow surface soil (0-1 ft bgs) at ISM sample locations B12ss-016M (4100 mg/kg) and B12ss-017M (2700 mg/kg). The detected concentration of manganese at one additional sample location (1800 mg/kg at B12ss-022M) also exceeded the National Guard Trainee FWCUG and the BSV but was equal to the precedent CUG; therefore, manganese was not identified as a COC at this sample location. The FWCUG Report presents chemicals for which a final ROD has been published at the RVAAP, including manganese resulting in a precedent CUG that reflects risk management considerations. The precedent CUG for manganese in surface soil is 1800 mg/kg, as documented in the *Interim Record of Decision for the*

Remediation of Soils at Load Lines 1 through 4 (USACE 2007a) and the *Record of Decision for Soil and Dry Sediment at the Fuze and Booster Quarry Landfill/ Ponds* (USACE 2007b). Manganese is not a COC in the deeper surface soil interval (1-3 ft bgs).

Chromium was not identified as a COC in shallow or deep surface soil. As noted previously, since hexavalent chromium is present at a very low concentration (below the FWCUG for hexavalent chromium alone), the concentration of total chromium was compared to the FWCUGs for trivalent chromium for identifying COCs at the AOC.

No additional COCs were identified based on the SOR analysis, as summarized below:

- None of the COPCs identified in shallow surface soil have similar non-cancer critical effects or target organs; therefore, an SOR for non-cancer endpoints was not calculated.

- Three COPCs [cobalt, RDX, and benzo(a)pyrene] identified in shallow surface soil have FWCUGs for the cancer endpoint. An SOR was calculated for these three chemicals for each ISM sample (Table G-8). The calculated SORs for cobalt, RDX, and benzo(a)pyrene are ≤ 1; therefore, no additional COCs were identified.

- Only one COPC (arsenic) was identified in deep surface soil; therefore, no SOR was performed for deep surface soil.

The location of surface soil ISM samples having COCs is shown in Figure 8-1. No COCs were identified in deep surface soil or subsurface soil discrete samples.

Table 7-9. COCs Identified for Surface Soil (0-1 ft bgs) ISM Samples: National Guard Trainee

COC	FWCUG[a] (mg/kg)	Background (mg/kg)	Precedent CUG (mg/kg)	Shallow Surface Soil (0-1 ft bgs)	
				ISM Sample Location[b]	Result (mg/kg)
Manganese	351	1450	1800	B12ss-016M	4100
				B12ss-017M	2700

[a]No COCs were identified in ISM samples at:
B12ss-013M B12ss-019M B12ss-036M
B12ss-014M B12ss-020M B12ss-037M
B12ss-015M B12ss-022M B12ss-038M
B12ss-018M
bgs = below ground surface
COC = Chemical of Concern
CUG = Cleanup Goal
FWCUG = Risk-based Facility-Wide Cleanup Goal
ISM = Incremental sampling methodology

National Guard Trainee COCs for Sediment

COC screening for sediment for the National Guard Trainee receptor is detailed in Appendix G, Tables G-10 (screening ISM samples against receptor-specific FWCUGs) and G-11 (Screening discrete samples against receptor-specific FWCUGs). No COCs were identified in ISM or discrete sediment samples. Chromium was detected in one discrete sediment sample (20.2 mg/kg) at a concentration just above its background concentration (18.1 mg/kg) and the FWCUG for hexavalent chromium (16.4 mg/kg), but well below the FWCUG for trivalent chromium (1,000,000 mg/kg). Chromium speciation analysis for soil indicates the FWCUG for trivalent chromium is appropriate for evaluation of total chromium results in soil at the Building 1200 AOC. The potential source of chromium contamination to the sediment and soil are the same; therefore, this conclusion applies to both media. Thus, chromium was not identified as a COC in sediment. No COCs were identified based on the SOR analysis as summarized below:

- None of the COPCs identified in sediment have similar non-cancer critical effects or target organs; therefore, an SOR for non-cancer endpoints was not calculated.

- Only one COPC (cobalt) identified in discrete sediment samples has a FWCUG for the cancer endpoint. Hexavalent chromium was not included in the SOR because the chromium at the Building 1200 AOC is primarily in the trivalent form.

No FWCUGs are available for cobalt in sediment. FWCUGs are available for cobalt in surface soil. The sediment and surface soil FWCUGs are the same for this receptor; therefore, cobalt concentrations were compared to the FWCUG for soil for the identification of COCs in sediment.

National Guard Trainee COCs for Surface Water

COC screening for surface water for the National Guard Trainee receptor is detailed in Appendix G, Tables G-12 (screening against receptor-specific FWCUGs) and G-13 (SOR for carcinogens). No COCs were identified in surface water for the National Guard Trainee. 3-Nitrotoluene was identified as exceeding the FWCUG in surface water because no FWCUG is available for this chemical. The detected concentration of 3-nitrotoluene (0.00049 mg/L) is less than the tap water RSL (0.0037 mg/L) corresponding to an HQ of 1.0. Incidental exposure to surface water by a National Guard Trainee will be much less than tap water ingestion. Thus, 3-nitrotoluene is not a COC for surface water. No COCs were identified based on the SOR analysis as summarized below:

- The COPCs identified in surface water [manganese, RDX, and bis(2-ethylhyxyl)phthalate] and having non-cancer FWCUGs all have different non-cancer critical effects or target organs. Therefore, no SOR was performed for the non-cancer FWCUGs.

- Two COPCs [RDX and bis(2-ethylhexyl)phthalate] identified in surface water samples have FWCUGs for the cancer endpoint. An SOR was calculated for each discrete surface water

sample (Table G-13). The SORs are $\leq$ 1; therefore, no additional COCs were identified for surface water.

7.2.4.4 Identification of COCs: Resident Farmer

Resident Farmer COCs for Soil

COC screening for the shallow surface soil interval (0-1 ft bgs) for the Resident Farmer receptor is detailed in Appendix G, Tables G-14 (screening against receptor-specific FWCUGs) and G-15 (SOR for carcinogens). COC screening for subsurface soil (1-3 ft bgs) for the Resident Farmer receptor is detailed in Appendix G, Table G-16 (screening against receptor-specific FWCUGs and SOR). Soil COCs for the Resident Farmer are summarized below and in Table 7-10.

- Manganese was identified as a COC for the Resident Farmer in shallow surface soil (0-1 ft bgs) at ISM sample location B12ss-016M. The detected EPC in this sample is shown in Table 7-10. The FWCUG is the smaller of the calculated FWCUGs for the Resident Farmer Child (2,927 mg/kg) and Resident Farmer Adult (14,817 mg/kg). Manganese was not identified as a COC in subsurface soil (1-3 ft bgs).

- Arsenic was identified as exceeding a FWCUG in discrete subsurface soil (1-3 ft bgs) samples for the Resident Farmer. The MDC for subsurface soil (25.5 mg/kg) exceeds the FWCUG for the Resident Farmer Adult (4.25 mg/kg) and the BSV of 19.8 mg/kg. Arsenic was not identified as a COC in subsurface soil based on the following WOE:
  - Evaluation of the arsenic soil data indicates soil concentrations are not indicative of AOC contamination.
    - Detected concentrations of arsenic in surface soil at the Building 1200 AOC range from 2.7 to 14 mg/kg. The BSV for arsenic in surface soil at RVAAP is 15.4 mg/kg.
    - Detected concentrations of arsenic in subsurface soil at the Building 1200 AOC range from 7.4 to 25.5 mg/kg, with the second highest arsenic concentration being 14.6 mg/kg. The BSV for arsenic in subsurface soil at RVAAP is 19.8 mg/kg.
    - The MDC for arsenic in subsurface soil (25.5 mg/kg) is from the 1-1.8 ft bgs interval from soil boring B12sb-031 located in the former settling pond. The measured concentration in the 0-1 ft bgs sample collected from the same boring directly above this sample (i.e., B12sb-031 0-1 ft bgs) was 13.4 mg/kg (below the RVAAP BSV). providing evidence that the concentration of arsenic in the deeper sample is not a result of discharge to the pond.
    - Arsenic is a common element in Ohio, and values exceeding 20 mg/kg are not uncommon (ODNR 2010).
  - The BSV concentration of arsenic (19.8 mg/kg) has an estimated cancer risk of 5E-05 to the Resident Farmer Adult, while the subsurface MDC concentration (25.5 mg/kg) has an estimated cancer risk of 6E-05 to the Resident Farmer Adult. These values are essentially the same, and both exceed the Ohio EPA TR of 1E-05 but are below the range specified in the NCP (USEPA 1990) of 10-6 to 10-4. Per USEPA (1990) any decisions to address risks in

this range, either through additional study or engineered control measures, should account for uncertainty in the risk estimates. Additional uncertainty assessment is provided in Section 7.2.5.

No additional COCs were identified based on the SOR analysis as summarized below:

- None of the COPCs identified in soil have similar non-cancer critical effects or target organs; therefore, an SOR for non-cancer endpoints was not calculated.

- Three COPCs [cobalt, RDX, and benzo(a)pyrene] identified in shallow surface soil have FWCUGs for the cancer endpoint. An SOR was calculated for these three chemicals for each ISM sample (Table G-15). The SORs are $\leq$ 1; therefore, no additional COCs were identified.

- Only one COPC (arsenic) was identified in deep surface soil; therefore, no SOR was performed for deep surface soil.

The location of surface soil ISM samples having COCs is shown in Figure 8-1.

Table 7-10. COCs Identified for Evaluation in the FS for Surface Soil (0-1 ft bgs) ISM Samples and Subsurface Soil (1-3 ft bgs) Discrete Samples: Resident Farmer

			Shallow Surface Soil (0-1 ft bgs)	
COC	**FWCUG[a] (mg/kg)**	**Background (mg/kg)**	**ISM Sample Location[b]**	**Result (mg/kg)**
Manganese	2927	1450	B12ss-016M	4100

[a]Facility-Wide Clean Up Goal (FWCUG) is the minimum of the calculated FWCUGs for the Adult and Child Resident Farmer .
[b]No COCs were identified in ISM samples at:

B12ss-013M	B12ss-017M	B12ss-020M	B12ss-037
B12ss-014M	B12ss-089M	B12ss-022M	B12ss-038
B12ss-015M	B12ss-019M	B12ss-036M	

bgs = below ground surface
COC = Chemical of Concern
ISM = Incremental Sampling Method

Resident Farmer COCs for Sediment

COC screening for sediment for the Resident Farmer receptor is detailed in Appendix G Tables G-17 (ISM samples) and G-18 (discrete samples). No COCs were identified in ISM or discrete sediment samples because all detected concentrations were less than FWCUGs. No COCs were identified based on the SOR analysis as summarized below:

- None of the COPCs identified in sediment have similar non-cancer critical effects or target organs; therefore, an SOR for non-cancer endpoints was not calculated.

- Only one COPC (cobalt) identified in discrete sediment samples has a FWCUG for the cancer endpoint. Hexavalent chromium was not included in the SOR because the chromium at the Building 1200 AOC is primarily in the trivalent form, as described previously.

No FWCUGs are available for cobalt in sediment. FWCUGs are available for cobalt in surface soil. The sediment and surface soil FWCUGs are the same for this receptor; therefore, cobalt concentrations were compared to the FWCUG for soil for the identification of COCs in sediment.

Resident Farmer COCs for Surface Water

COC screening for surface water for the Resident Farmer receptor is detailed in Appendix G Tables G-19 and G-20. No COCs were identified in surface water for the Resident Farmer. 3-Nitrotoluene was identified as exceeding a FWCUG in surface water because no FWCUG is available for this chemical. The detected concentration of 3-nitrotoluene (0.00049 mg/L) is less than the tap water RSL (0.0037 mg/L) corresponding to an HQ of 1.0. Incidental exposure to surface water will be much less than tap water ingestion. Thus, 3-nitrotoluene is not a COC for surface water. No COCs were identified based on the SOR analysis as summarized below:

- The COPCs identified in surface water [manganese, RDX, and bis(2-ethylhyxyl)phthalate] and having non-cancer FWCUGs all have different non-cancer critical effects or target organs. Therefore, no SOR was calculated for the non-cancer FWCUGs.

- Two COPCs [RDX and bis(2-ethylhexyl)phthalate] identified in surface water samples have FWCUGs for the cancer endpoint. A SOR was calculated for each discrete surface water sample (Table G-20). The SORs are $\leq$ 1: therefore, no additional COCs were identified for surface water.

7.2.5 Uncertainty Assessment

The sources of uncertainty, as well as the potential bias they impart to the risk assessment (i.e., whether conservatism is increased or decreased), are briefly discussed below.

7.2.5.1 Uncertainty in Estimating Potential Exposure

Sources of uncertainty in estimating potential human exposure include limitations of the sampling and analysis, comparison to background concentrations to identify SRCs, and estimation of EPCs.

Sampling Limitations - Uncertainties arise from limits on the media sampled, the total number and specific locations that can be sampled, and the parameters chosen for analysis to characterize the AOC. Surface soil has been characterized using ISM sampling biased toward areas anticipated to have the highest level of potential contamination. The results of surface soil sampling were used to efficiently guide selection of locations for discrete subsurface soil sampling locations with a bias toward the areas of highest potential contamination.

Analytical Limitations - Uncertainty is associated with the chemical concentrations detected and reported by the analytical laboratory. The quality of the analytical data used in the risk assessment was maximized and uncertainty minimized by implementing QA/QC procedures that specify how samples are selected and handled; however, sampling errors, laboratory analysis errors, and data analysis errors can occur. Beyond the potential for errors, there is normal variability in analytical results. Some current analytical methods are limited in their ability to achieve detection limits at or below risk-based screening levels. Under these circumstances, it is uncertain whether the true concentration is above or below the screening levels, which are protective of human health. When analytes have a mixture of detected and non-detected concentrations, EPC calculations may be affected by these detection limits. Risks may be overestimated as a result of some sample concentrations being reported as non-detectable concentrations at the method detection limit (MDL), when the actual concentration may be much smaller than the MDL. Risks may also be underestimated if some analytes that were not detected in any sample were removed from the COPC list. If the concentrations of these analytes are below the MDL but are above the screening level, the risk from these analytes would not be included in the risk assessment results. J-qualified results, indicating the analyte was positively identified but the associated numerical value is an approximate concentration of the analyte in the sample, were included in the risk assessment. The assignment of a J qualifier may result from analytical results that are below the reporting limit or high or low MS recoveries. Use of J-qualified results generally introduces little uncertainty into the risk assessment unless the J-qualified result is used as the EPC, and the EPC is very close to a decision criterion. At the Building 1200 AOC, antimony, arsenic, barium, calcium, chromium, copper, magnesium, nickel, potassium, vanadium, and zinc concentrations were qualified as estimated ("J") for 117 results (34% of inorganic chemicals data) due to high or low MS recoveries. The impact of uncertainty associated with most of these inorganic chemicals is small because the reported concentrations are well below background concentrations and FWCUG values; however, the MDC of arsenic in subsurface soil (25.5 mg/kg) was identified as exceeding the FWCUG for the Resident Farmer receptor (4.25 mg/kg) and the subsurface soil BSV (19.8 mg/kg). The MDC of arsenic is a J-qualified result due to high MS recoveries. The MS/MSD results associated with this sample were 129/122 and 98/125.

Identification of SRCs - Uncertainty associated with screening against background concentrations results from statistical limitations and natural variation in background concentrations. Because of this variation, inorganic chemical concentrations below BSV are likely representative of background conditions. Inorganic chemical concentrations above the BSV may be above background concentrations, or may reflect natural variation. This is especially true for measured concentrations close to the BSV. At the Building 1200 AOC, four inorganic chemicals (selenium, nickel, cobalt, and aluminum) had MDCs in surface soil that were less than 2x (specifically 1.2x to 1.7x) the BSV and four other inorganic chemicals (lead, zinc, beryllium, and arsenic) had MDCs in subsurface soil that were less than 2x (specifically 1.2x to 1.3x) the BSV. The consequences of carrying most of these inorganic chemicals forward as SRCs, even if they are actually representative of background concentrations, is negligible because they are not toxic at near-background concentrations. By contrast, naturally-occurring arsenic in soil exceeds risk-based CUGs. Therefore, the consequence of identifying arsenic as an SRC if it is, in fact, representative of background can have a significant impact on the conclusions of the risk assessment. The MDCs of arsenic in surface and subsurface soil

at the Building 1200 AOC are 14 mg/kg and 25.5 mg/kg respectively. The BSVs for arsenic at RVAAP are 15.4 mg/kg for surface soil and 19.8 mg/kg for subsurface soil. Vosnakis and Perry (2009) recently published the results of arsenic background concentration studies that included 313 samples of Ohio soil. Naturally occurring arsenic in these samples ranged from 1.6 mg/kg to 71.3 mg/kg with 95th percentiles of 21.7 mg/kg in surface soil 25.5 mg/kg in subsurface soil, and upper tolerance limits of 22.8 mg/kg and 29.6 mg/kg for surface and subsurface soil respectively. In other studies, native soil concentrations of arsenic in Ohio have been reported as ranging from 0.5 to 56 mg/kg (Ohio EPA 1996) and the United States Geological Survey's (USGS) *Certificate of Analysis of the Devonian Ohio Shale* estimates arsenic concentrations of 68.5 mg/kg are naturally present in bedrock shales (USGS 2004). The MDC for arsenic in subsurface soil is from the 1-1.8 ft bgs interval from soil boring B12sb-031 located in the former settling pond. The measured concentration in the sample collected directly above this sample (i.e., B12sb-031 0-1 ft bgs) was 13.4 mg/kg (below the RVAAP BSV) providing further evidence that the concentration of arsenic in the deeper sample is not a result of discharge to the pond. These results indicate arsenic at the Building 1200 AOC is naturally occurring rather than contamination.

Exposure Point Concentrations - Shallow surface soil was characterized using ISM sampling techniques. ISM samples provide a physical average concentration across an exposure area. Use of ISM sampling reduces the uncertainty associated with estimating a statistical average exposure. There is some evidence the use of stainless steel grinding blades in the processing of ISM samples could contribute chromium and nickel to the ISM soil samples. Generally, the UCL on the arithmetic mean was adopted as the EPC for discrete sample results and was considered to represent a conservative estimate of the average concentration. This imparts a small but intentional conservative bias to the risk assessment, provided the sampling captured the most highly contaminated areas. Representative EPCs for the EU were calculated from discrete data or were measured with ISM data based on the assumption that the samples collected from the EU were truly random samples. This assumption is not true for the Building 1200 AOC where sample locations were biased to identify areas of highest chemical concentrations. Therefore, EPCs generated from these data are likely to represent an upper bound of potential exposure concentrations.

7.2.5.2 Uncertainty in Use of FWCUGs

Sources of uncertainty in the FWCUGs used to identify COCs include the selection of appropriate receptors and the exposure parameters, exposure models, and toxicity values used in the calculation of FWCUGs.

Selection of Representative Receptors - While future land uses were developed to steer the cleanup program at the facility (as summarized in the FWHHRAM) and it is known the OHARNG will control and use the property for military training, there is still some uncertainty in the specific details of the future land use. There is little to no uncertainty associated with the assumption that RVAAP will not be released for Residential Land Use; however, a Resident Farmer receptor is included to provide an unrestricted evaluation.

Exposure Parameters and Exposure Models - For each primary exposure pathway included in the FWCUGs, assumptions are made concerning the exposure parameters (e.g., amount of contaminated media a receptor can be exposed to and intake rates for different routes of exposure) and the routes of exposure. Most exposure parameters have been selected so that errors occur on the side of human health protection. When several of these upper-bound values are combined in estimating exposure for any one pathway, the resulting risks can be in excess of the 99th percentile and, therefore, outside of the range that may be reasonably expected. Therefore, the consistent selection of upper-bound parameters generally leads to overestimation of the potential risks.

Highly protective exposure parameters used in the FWCUGs for the National Guard Trainee include the assumptions that: (1) a trainee will return to the same AOC at RVAAP for all training over a 25 year enlistment period; (2) the trainee breathing rate is 44 m^3/day (versus a normal breathing rate of 20 m^3/day); and (3) trainees are exposed to airborne chemicals as a result of very high dust loading associated with potential dust generation during use of heavy equipment (e.g., tanks) driven on hard dry ground 24 hours/day for their entire training period. The last two assumptions strongly impact the FWCUGs for chemicals that are primarily toxic via the inhalation pathway. For example, for a portion of the year, there is no dust loading due to precipitation (i.e., during much of the training time there is mud present). The National Oceanic and Atmospheric Administration (NOAA) lists the mean precipitation days with precipitation >1 mm for the Cleveland area as 115 days/year.

Toxicity Values - The toxicity of chemicals is under constant study and values change from time to time. The toxicity values used in the calculation of the FWCUGs were the most recent values available at the time of those calculations (September 2008). These values are designed to be conservative and provide an upper-bound estimate of risk.

The toxicity and mobility of many inorganic chemicals in the environment is dependent on the chemical species present. Two important examples are arsenic and chromium. Inorganic arsenic, arsenite (As+3) and arsenate (As+5), are the most toxic arsenic species with As+3 being more toxic than As+5. Methylated arsenic, such as monomethylarsonic acid and dimethylarsinic acid are less toxic, and arsenic compounds such as arsenocholine and arsenobetaine are considered to be non-toxic (Pongratz 1998). The toxicity values used in developing the FWCUGs are for inorganic arsenic; however, these values do not distinguish between arsenite and arsenate.

Chromium is generally present in the environment as either the trivalent (Cr+3) or hexavalent (Cr+6) species with the trivalent form generally being more stable and, therefore, more common. FWCUGs are available for both hexavalent chromium and trivalent chromium. Trivalent chromium has not been shown to be carcinogenic. It is an essential micronutrient but can also be toxic at high doses (i.e., above reference dose used to calculate the FWCUG). The FWCUG for trivalent chromium is based on non-cancer effects. Hexavalent chromium is much more toxic than trivalent chromium. It is classified as a known human carcinogen and may also cause non-cancer effects. The cancer URF for hexavalent chromium published in IRIS is based on epidemiological data on lung cancer in workers associated with chromate production. Workers in the chromate industry are exposed to both trivalent and hexavalent compounds of chromium. The cancer mortality in the study used to establish

the URF was assumed to be due to hexavalent chromium, which was further assumed to be no less than one-seventh of the total chromium in the air the workers were exposed to. As noted in IRIS, the assumption that the ratio of hexavalent to trivalent chromium was 1:6 in this study may lead to a sevenfold underestimation of risk when using this URF to evaluate exposure to hexavalent chromium alone.

To avoid the underestimation of risk, the selection of FWCUG for chromium includes a step that compares the maximum concentration of hexavalent chromium detected in chromium speciation samples to a FWCUG adjusted to represent only hexavalent chromium. The lowest FWCUG for hexavalent chromium is for the National Guard Trainee (16.4 mg/kg) and is based on a cancer URF calculated using a chromate mixture containing 14% hexavalent chromium (USEPA 2010b). Since the study used as the basis for the cancer URF included workers exposed to both trivalent and hexavalent chromium, the FWCUG must be adjusted to represent only hexavalent chromium. One-seventh (14%) of the National Guard Trainee FWCUG (16.4/7 = 2.3 mg/kg) is appropriate for evaluation of hexavalent chromium alone. Concentrations of hexavalent chromium in chromium speciation samples that are less than or equal to 2.3 mg/kg indicate that hexavalent chromium is not present above the hexavalent chromium FWCUGs and supports use of the trivalent chromium FWCUGs for evaluation of total chromium results.

At the Building 1200 AOC, three discrete surface soil samples were collected during the PBA08 RI and analyzed for hexavalent chromium and total chromium. No hexavalent chromium was detected in two of the three speciation samples. Hexavalent chromium was detected in the third sample at an estimated (J qualified, less than the laboratory reporting limit) concentration of 0.39 mg/kg which is less than 2.3 mg/kg. Based on these speciation results, hexavalent chromium is not of concern at the Building 1200 AOC, so the use of the trivalent chromium FWCUG is appropriate for the identification of COCs, and minimizes the associated uncertainty.

7.2.5.3 Uncertainty in the Identification of COCs

The SOR is used to account for the potential additive effects from exposure to multiple chemicals that can cause the same effect or affect the same target organ. Cancer risk is assumed to be additive for all carcinogens. Non-cancer risk is assumed to be additive for chemicals with similar sites of toxicological action. In the event that any combination of COPCs results in synergistic effects, risk might be underestimated. Conversely, the assumption of additivity would overestimate risk if a combination of COPCs acted antagonistically. It is unclear whether the potential for chemical interaction has been inadvertently understated or overstated. It seems unlikely that the potential for chemical interaction contributes significant uncertainty to the conclusions of the risk assessment.

Manganese and arsenic were identified as exceeding FWCUGs in soil at the Building 1200 AOC based on comparison to FWCUGs. Arsenic was identified in deep surface surface/subsurface soil because the MDC (used as the EPC) at sample location B12sb-031 exceeds the FWCUGs and the RVAAP BSV. Additional information including an evaluation of the natural variability of arsenic in Ohio soil and the concentration of arsenic in soil directly above the measured MDC indicate the

measured arsenic concentrations at the Building 1200 AOC reflect natural variation, and arsenic is not a COC.

3-Nitrotoluene was identified as a COPC in surface water because no screening values (FWCUG or RSL) are available for this chemical. Because no screening values are available, 3-nitrotoluene was not identified as a COC. 3-Nitrotoluene was detected at an estimated concentration of 0.00094J mg/L in one of two surface water samples collected at the former settling pond. Because of the very low concentration, the lack of toxicity values for 3-nitrotoluene does not contribute significantly to uncertainty in the results of the risk assessment.

All of the sources of uncertainty described in the previous sections potentially impact the identification of COCs. The exposure and toxicity values used to calculate FWCUGs, as well as the approach for identifying SRCs, COPCs, and ultimately COCs based on the FWCUGs, were designed to ensure the over-estimation rather than under-estimation of potential risks. The uncertainty assessment attempts to put the identified COCs in perspective to facilitate informed risk management decisions for the AOC.

7.2.6 Summary of HHRA

This HHRA documents the COCs that may pose potential health risks to human receptors resulting from exposure to contamination at the Building 1200 AOC. This HHRA was conducted as part of the RI/FS report and was based on the streamlined approach described in the FWCUG Report. The components of the risk assessment (receptors, exposure media, EPCs, and results) are summarized below.

Receptors. RVAAP is a controlled-access facility and is fenced and patrolled by security personnel. The Building 1200 AOC is located in the eastern portion of RVAAP and is currently inactive. Full-time OHARNG, BRAC, and contractor staff work at the facility. Military training and operations are conducted at the facility. The OHARNG projected future land-use for the AOC is Military Use and Training. The most representative receptor is the National Guard Trainee and, per the FWHHRAM, this constitutes the Risk Assessment Land Use of Dismounted Training-Digging. National Guard Training, in conjunction with the evaluation of agricultural-residential land uses and associated receptors, form the basis for identifying COCs. Residential Land Use, specifically the Resident Farmer, is included to evaluate COCs for unrestricted land use at the AOC as required by the CERCLA process and as outlined in the FWHHRAM.

Exposure Media. Media of concern at the Building 1200 AOC are surface soil, subsurface soil, surface water, and sediment. Soil data in the Building 1200 EU were aggregated into surface and subsurface soil. Surface soil is defined as 0-1 ft bgs (i.e., shallow surface soil) for the Resident Farmer, and 0-4 ft bgs (i.e., deep surface soil) for the National Guard Trainee. Because the upper (0-1 ft bgs) portion of this interval was characterized using ISM sampling and the deeper (1-3 ft bgs) portion was characterized using discrete samples from soil borings, the two intervals that make up deep surface soil for the National Guard Trainee were evaluated separately. No samples were

available below 3 ft bgs due to the presence of shallow bedrock. Subsurface soil is defined as 1-13 ft bgs for the Resident Farmer; however, due to the lack of soil below 3 ft bgs, the 1-3 ft bgs interval was used to evaluate subsurface soil for this receptor. Subsurface soil is defined as 4-7 ft bgs for the National Guard Trainee. Shallow bedrock precludes the collection of subsurface samples at this depth; therefore, subsurface soil was not evaluated for this receptor at the Building 1200 AOC.

Estimation of EPCs. For shallow surface soil (0-1 ft bgs), the EPC is the detected concentration in each ISM sample collected at the Building 1200 AOC. For deep surface and subsurface soil (1-3 ft bgs), the EPC was calculated from the results of all of the discrete samples collected from this depth at the Building 1200 AOC. The EPC was either the 95% UCL of the mean or the MDC, whichever value is lowest. The limited number of sediment and surface water samples were evaluated individually (i.e., the number of samples was too small to calculate 95% UCLs).

Results of Human Health Risk Assessment. Manganese was the only COC identified in ISM surface soil (0-1 ft bgs) for the National Guard Trainee at ISM sample locations B12ss-016M and B12ss017M. No COCs were identified in deep surface soil (1-3 ft bgs) discrete samples for this receptor. Manganese was also identified as a COC in ISM shallow (0-1 ft bgs) surface soil for the Resident Farmer at ISM location B12ss-016M. Manganese was not identified as a COC in subsurface soil (1-3 ft bgs). Arsenic was identified as exceeding a FWCUG at one discrete subsurface soil location, but further evaluation indicates this inorganic chemical is not indicative of AOC-related contamination; therefore, it is not recommended as a COC for evaluation in the FS. No COCs were identified in surface water or sediment samples. COCs identified for each potential exposure medium and receptor are summarized in Table 7-11.

Table 7-11. COCs Identified in Potential Exposure Media

Media	Chemical of Concern	Cleanup Goal (mg/kg)
National Guard Trainee		
Shallow Surface Soil (0-1 ft bgs)	Manganese	1,800[a]
Deep Surface Soil (1-3 ft bgs)	None	None
Sediment	None	None
Surface Water	None	None
Resident Farmer		
Shallow Surface Soil (0-1 ft bgs)	Manganese	2,927
Subsurface Soil (1-3 ft bgs)	None	None
Sediment	None	None
Surface Water	None	None

[a]Precedent CUG published in the *Interim Record of Decision for the Remediation of Soils at Load Lines 1 through 4* (USACE 2007a), and the *Record of Decision for Soil and Dry Sediment at the Fuze and Booster Quarry Landfill/Ponds (RVAAP-16)* (USACE 2007b) as documented in Table 5-12 of the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a).
bgs = below ground surface
COC = chemical of concern
mg/kg = milligram per kilogram

7.3 ECOLOGICAL RISK ASSESSMENT

7.3.1 Introduction

The ERA presented in this RI/FS report follows a unified approach of methods integrating U.S. Army, Ohio EPA, and USEPA guidance. This ERA approach is consistent with the general approach by these agencies and primarily follows the Level I Scoping ERA, Level II Screening ERA, and Level III Baseline ERA outlined in the *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2008), with specific application of components from the FWERWP, *Risk Assessment Handbook Volume II: Environmental Evaluation* (USACE 2010b), and *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments* (USEPA 1997). The process implemented in this RI/FS report combines these guidance documents to meet requirements of the Ohio EPA and U.S. Army, while following previously accepted methods established for RVAAP. This unified approach resulted from coordination between USACE and Ohio EPA during the summer of 2011.

7.3.1.1 Scope and Objective

The Building 1200 AOC contains habitat (soil, sediment, and occasional surface water) that supports ecological receptors. The predominantly terrestrial habitat has known chemical contamination (MKM 2007). Habitat types and an assessment of the ecological resources found at the Building 1200 AOC are presented in subsequent subsections. Additionally, the results of a historical ERA (an ERS performed as part of the Characterization of 14 AOCs) and the PBA08 RI are provided to determine whether a qualitative ERA (Level I) is sufficient, based on the quality of the habitat and the presence of contamination, or whether a more rigorous ERA (Level II or Level III) should be conducted.

7.3.2 Level I: Scoping Level Ecological Risk Assessment

The ERA method for Level I follows guidance documents listed in Section 7.3.1. Level I is intended to evaluate if the AOC had past releases or the potential for current contamination, and if there are important ecological resources on or near the AOC.

The following two questions should be answered at the completion of the Level I ERA:

1. **Are current or past releases suspected at the AOC?** Current or past releases are determined by evidence that chemical contaminants or COPECs are present.

2. **Are important ecological resources present at or in the locality of the AOC?** Important ecological resources are defined in the *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2008) and *Technical Document for Ecological Risk Assessment: Process for Developing Management Goals* (BTAG 2005).

If an AOC has contaminants but lacks important ecological resources, this indicates the ERA process can stop at Level I. Contamination and important ecological resources must both be present to proceed to a Level II Screening Level ERA.

7.3.2.1 AOC Description and Land Use

The Building 1200 AOC is approximately 7.7 acres in size. This includes the 0.39-acre former settling pond. The buildings have been removed from the Building 1200 AOC. The dominant habitat is forest and is large enough to completely support cover and food for small birds and mammals (e.g., robins and mice) that typically require approximately 1 acre (USEPA 1993). The habitat area at the Building 1200 AOC represents approximately 0.03% of the 21,683 acres at RVAAP. U.S. Army natural and ecological resource management activities may apply if habitat disturbance occurs during remedial activities.

7.3.2.2 Evidence of Historical Chemical Contamination

The goal of the historical ERA (MKM 2007) was to identify COPECs in soil, sediment, and surface water for the Building 1200 AOC. The historical ERA followed instructions presented in the *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2003) and consisted of the first two of six steps listed in Figure III of the FWERWP (USACE 2003c). These two steps identify the evaluation procedures, which were used to determine AOC-related COPECs. First, the MDC of each chemical was compared to its respective facility-wide background concentration. Chemicals were not considered COPECs if the MDC was below the background concentration. For all chemicals detected above background concentrations, the MDC was compared to an ESV. The hierarchy of screening values was based on the guidance included in the FWERWP and *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2003). In addition to the ESV comparison, it was determined if the chemical was a persistent, bioaccumulative, and toxic (PBT) compound. Chemicals were retained as COPECs if they exceeded background concentrations and the ESV, if the chemical exceeded background concentrations and had no toxicity information, or if the chemical was considered a PBT compound.

Groundwater was not included in the historical ERA. As explained in Section 3.2.2 of the FWERWP, groundwater is not considered an exposure medium to ecological receptors because these receptors are unlikely to contact groundwater greater than 5 ft bgs. As discussed in Section 3.4.2, initial depths to groundwater encountered during well installation activities varied from 12-20 ft bgs.

The historical ERA tables are provided in Appendix H, Tables H-1, H-2, and H-3 and contain the following:

- Frequency of detection;
- Average concentration;
- MDC;
- Background concentration;

- SRC determination;
- Sediment reference value (SRV) (part of the SRC determination for sediment);
- ESVs used for COPEC determinations;
- PBT compound identification;
- COPEC determination; and
- COPEC rationale.

Historical COPECs for Soil. The historical ERA conducted as part of the Characterization of 14 AOCs reported 33 chemicals in surface soil (0-1 ft) at the Building 1200 AOC (MKM 2007). Of the 33 chemicals detected, four chemicals (calcium, magnesium, potassium, and sodium) were essential nutrients and were excluded from the COPEC screen (Appendix H, Table H-1). Seventeen detected inorganic chemicals and 13 organic chemicals were determined to be SRCs because they either exceeded background concentrations or did not have an associated background concentration for comparison. Ten of the inorganic chemicals (aluminum, barium, chromium, copper, iron, lead, manganese, mercury, selenium, and zinc) were identified as COPECs because detected concentrations were above ESVs (Table 7-12). In addition, four organic chemicals (TNT, HMX, RDX, and nitrocellulose) were selected as COPECs because they do not have an ESV. One of these 14 soil COPECs was also a PBT compound (mercury).

Historical COPECs for Sediment. The historical ERA conducted as part of the Characterization of 14 AOCs reported 27 chemicals in sediment at the Building 1200 AOC (MKM 2007). Of the 27 chemicals detected, four chemicals (calcium, magnesium, potassium, and sodium) were essential nutrients and were excluded from the COPEC screen (Appendix H, Table H-2). Eight detected inorganic chemicals and seven organic chemicals were determined to be SRCs because they either exceeded background concentrations or did not have an associated background concentration for comparison. Only two inorganic chemicals exceeded the SRV: mercury and lindane (gamma-BHC). Of the 15 SRCs, one inorganic chemical (mercury) and 2 organic chemicals (lindane and acetone) exceeded the ESVs and were identified as COPECs (Table 7-12). In addition, one inorganic chemical (beryllium) and one organic chemical (nitrocellulose) were selected as COPECs because they did not have an ESV. Two of these five sediment COPECs were also PBT compounds (mercury and lindane).

Historical COPECs for Surface Water. The historical ERA conducted as part of the Characterization of 14 AOCs reported 28 chemicals in surface water at the Building 1200 AOC (MKM 2007). Of the 28 chemicals detected, four chemicals (calcium, magnesium, potassium, and sodium) were essential nutrients and were excluded from the COPEC screen (Appendix H, Table H-3). Eleven detected inorganic chemicals and twelve organic chemicals were determined to be SRCs because they either exceeded background concentrations or did not have an associated background concentration for comparison. Of the 23 SRCs, none of the detections exceeded the ESV. However, two metals (iron and manganese) and three organic chemicals (acetone, benzoic acid, and benzenemethanol) were identified as COPECs (Table 7-12) because they do not have an ESV, and mercury was identified as a surface water COPEC because it is a PBT compound.

Table 7-12. Summary of Historical COPECs per the Characterization of 14 AOCs

Soil		Sediment	Surface Water	Groundwater
Aluminum	Mercury	Beryllium	Iron	Groundwater not evaluated for ERA
Barium	Selenium	Mercury	Manganese	
Chromium	Zinc	Lindane	Mercury	
Copper	TNT	Acetone	Acetone	
Iron	HMX	Nitrocellulose	Benzoic Acid	
Lead	RDX		Benzenemethanol	
Manganese	Nitrocellulose			

AOC = Area Of Concern
COPEC = Chemical of Potential Ecological Concern
HMX = octahydro-1,3,5,7-tetranitro-1,3,5,7-tetrazocine
RDX = hexahydro-1,3,5-trinitro-1,3,5-triazine
TNT = 2,4,6-trinitrotoluene
BHC =benzene hexachloride
ERA = Ecological Risk Assessment

Summary of Historical ERA. As explained previously, a historical ERA was performed to determine COPECs at the Building 1200 AOC in surface soil, sediment, and surface water. HQs were not calculated in this evaluation. The COPECs are summarized in Table 7-12. Based on the identification of COPECs, ecological risk in surface soil, sediment, and surface water was predicted in the historical investigation, and an additional investigation was recommended for the Building 1200 AOC (MKM 2007).

7.3.2.3 Ecological Significance

Sources of data and information about the ecological resources at the Building 1200 AOC include the *Integrated Natural Resources Management Plan* (INRMP) (OHARNG 2008), *Facility-Wide Biological and Water Quality Study* (USACE 2005b) where applicable, previous characterization work (e.g., Characterization of 14 AOCs), and visits to the AOC conducted for the PBA08 RI.

One of the two key questions to answer in the Level I Scoping ERA is whether there are ecologically important and especially ecologically significant resources at the Building 1200 AOC. Ecological importance is defined as a place or resource that exhibits unique, special, or other attributes that makes it of great value. Ecological significance is defined as an important resource found at an AOC or in its vicinity that is subject to contaminant exposure. The underlying basis for this distinction can be found in *Ecological Significance and Selection of Candidate Assessment Endpoints* (USEPA 1996a), stated as follows:

> "A critical element in the ERA process requires distinguishing important environmental responses to chemical releases from those that are inconsequential to the ecosystem in which the site resides: in other words, determining the ecological significance of past, current, or projected site-related effects."

Important places and resources identified by the U.S. Army and Ohio EPA (Appendix Table H-4) include wetlands, terrestrial areas used for breeding by large or dense aggregations of animals, habitat known to be used by threatened or endangered species, state land designated for wildlife or game

management, locally important ecological places, and state parks. Both the U.S. Army and Ohio EPA recognize 17 important places and resources. The U.S. Army recognizes an additional 16 important places (BTAG 2005), and the Ohio EPA recognizes another 6 important places (Ohio EPA 2008). In total, there are 39 important places. Presence or absence of an ecologically important place can be determined by comparing environmental facts and characteristics of the Building 1200 AOC with each of the important places and resources listed in Appendix Table H-4.

Ecological significance is defined as an important resource found at an AOC or in its vicinity that is subject to contaminant exposure. Thus, any important places and resources listed in Appendix Table H-4 are elevated to ecologically significant when present on the AOC and there is exposure to contaminants. For all 39 important places and resources, it is relatively clear that the ecological place or resource is either present or absent on the AOC; therefore, the decision process is objective. If no important or significant resource is present at an AOC, the evaluation will not proceed to Level II regardless of the presence of contamination. Instead, the Level I Scoping ERA would acknowledge there are important ecological places but that those resources are not ecologically significant and no further evaluation is required.

Management Goals for the AOC. Regardless of whether the evaluation is concluded at Level I or continues to Level II, there is another level of environmental protection for the Building 1200 AOC through the natural resource management goals expressed in the INRMP (OHARNG 2008). The U.S. Army is required to monitor ecological conditions to maintain or enhance the current integrity of the natural resources and ecosystem. Environmental and natural resource monitoring and management activities in place at Camp Ravenna may also be applicable to any degradation noted from contamination.

Some Natural Resources Management Goals of OHARNG (listed in Appendix Table H-5) benefit the Building 1200 AOC. For example, Goal 1 states the natural resources need to be managed in a compatible way with the military mission, and Goal 5 requires the U.S. Army to sustain usable training lands and native natural resources by implementing a natural resource management plan, which incorporates invasive species management, and utilizing native species mixes for re-vegetation after ground disturbance activities. These management goals help detect degradation (whether from training activities or historical contamination). While the applicability of the remaining 10 management goals to the Building 1200 AOC varies, all of the management goals are intended to either monitor, maintain, or enhance the facility's natural resources and ecosystem. While these goals are for the management of all types of resources at and near the Building 1200 AOC, they do not affect the decisions already concluded in Section 7.3.2.3 concerning the presence or absence of important or significant ecological places or resources at the Building 1200 AOC.

Important Places and Resources. Ecological importance means a place or resource that exhibits a unique, special, or other attribute that makes it of great value. Examples of important places and resources include wetlands, terrestrial areas used for breeding by large or dense aggregations of animals, and habitat of state-listed and federally-listed species. An important resource becomes significant when found on an AOC and there is contaminant exposure.

There are important/significant ecological resources at the Building 1200 AOC (Appendix Table H-4). A wetland is present, and there is a nearby wetland (OHARNG 2008). Also, a locally important ecological place is present at and around the Building 1200 AOC (Figure 7-1) that is a special interest area consisting of 700 acres of mixed mature woods. Special interest areas are recognized as noteworthy resources identified for special management and attention; there are five such areas at RVAAP. At the special interest area, the OHARNG states there are various stands of mature trees, one of which consists of approximately 50 acres of oak, maple, and tulip tree forest (OHARNG 2008). In addition, mature stands of beech-sugar maple forest occur.

Terrestrial Resources. The Building 1200 AOC is dominated by terrestrial resources, as described below.

Habitat Descriptions and Species. The INRMP and AOC visits showed that the Building 1200 AOC consists of three types of vegetation (Figure 7-2). The dominant vegetation is a forest combination (forest alliance) consisting of the American beech (*Fagus grandifolia*), sugar maple (*Acer saccharum*), and American tulip tree (*Liriodendron tulipifera*). The forest includes small open areas and understory that result in multi-story vegetation. This, in turn, provides various layers of vegetation for foraging height preferences of birds, mammals, insects, and other organisms. The cleared area to the west of the AOC continues to be landscaped/maintained grounds surrounding the former buildings (Photograph 7-1). The habitat to the east and around the former settling pond is intermittently flooded early-succession herbaceous field that is also recognized as wetland (OHARNG 2008) (Photograph 7-2). This characterization was originally established by a vegetation study using aerial photography and field verification (USACE 1999) and was later used in the INRMP (OHARNG 2008). Additional photographs of these habitats are provided in Appendix H.

All habitat types identified in 2010 at the Building 1200 AOC appear to be consistent with those reported in the INRMP, which is based on information from 1999. Also, all habitat types were assessed to be healthy and functioning based on May 2010 observations by SAIC biologists.

Functional habitat was determined by noting the absence of large bare spots and dead vegetation or other obvious visual signs of an unhealthy ecosystem. Also, the Ohio Rapid Assessment Method (ORAM) provides additional information about the health of the wetland.

Threatened and Endangered and Other State-listed and Federally-listed Species. There are currently no federally-listed species or critical habitat on Camp Ravenna. The Building 1200 AOC has not been previously surveyed for rare species; however, there have been no documented sightings of rare, threatened, or endangered species at the AOC (OHARNG 2008).

Other Terrestrial Resources. While there are no other known important features, there are other resources at or near the Building 1200 AOC (e.g., vegetation, animals) that interact in their ecosystems and support nutrient cycling and energy flow. For example, wildlife such as wild turkey (*Meleagris gallopavo*) and white-tailed deer (*Odocoileus virginianus*) could use the area. The INRMP provides information about species and habitat surveys at RVAAP (e.g., timber and

ecological succession) (OHARNG 2008). Aside from the natural resource map in the INRMP (OHARNG 2008) as shown in Figure 7-2, there are no other reported surveys of habitats and animals at the Building 1200 AOC.

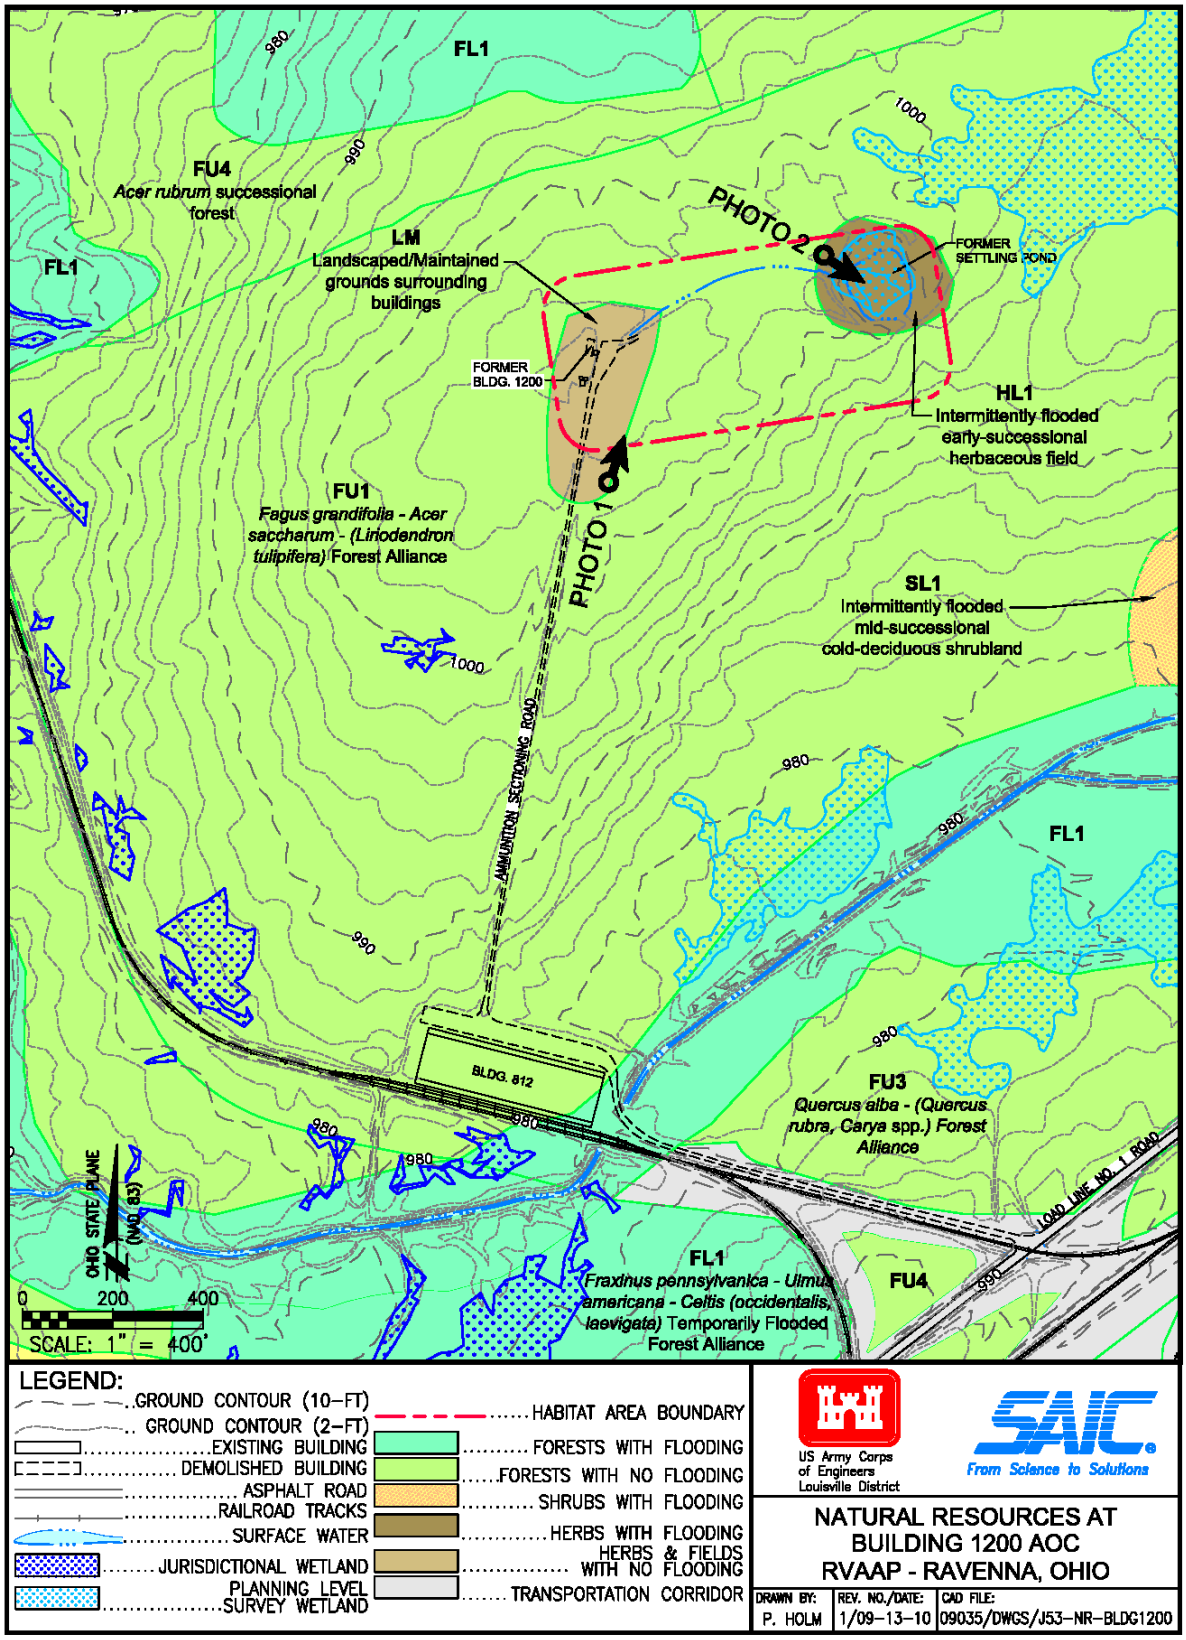

Figure 7-1. Important Ecological Resources (OHARNG 2008) at and Near the Building 1200 AOC

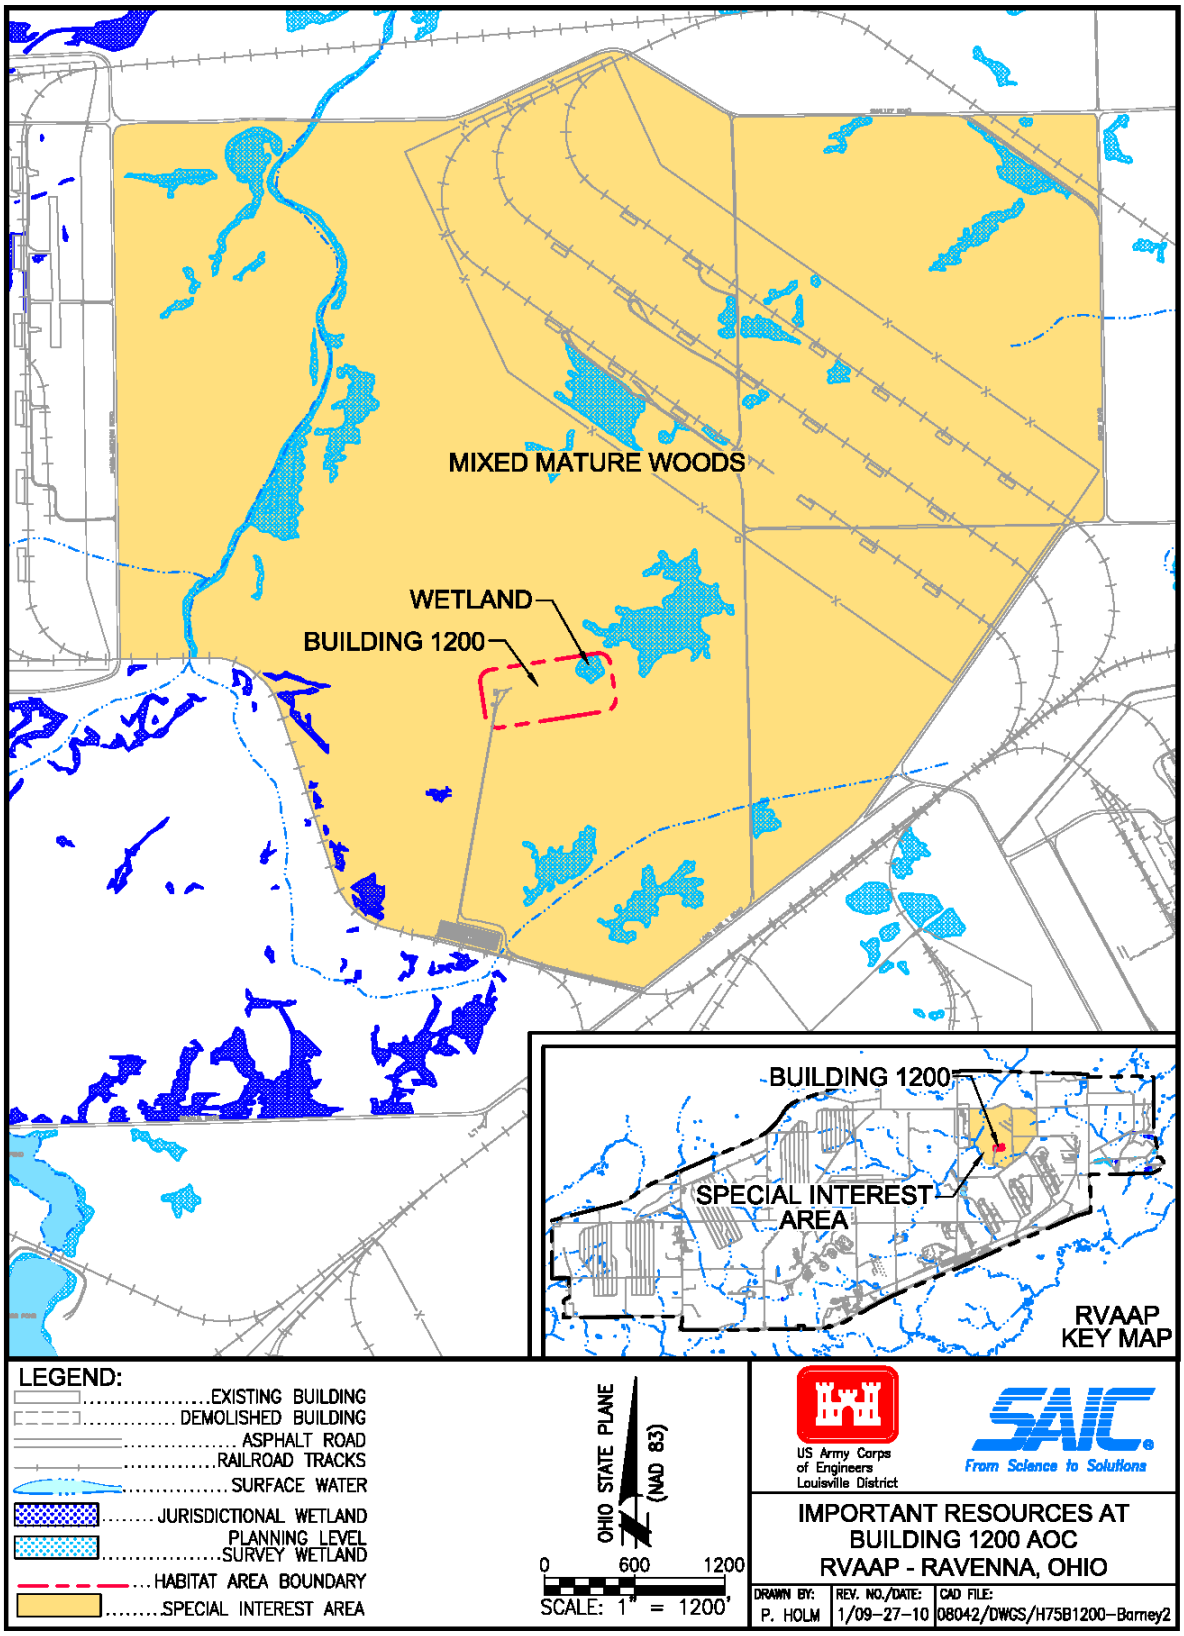

Figure 7-2. Natural Resources (OHARNG 2008) Inside and Near Habitat Area

Photograph 7-1. Maintained Grounds in the Western Part of the Habitat Area (facing north-northeast August 12, 2008)

Photograph 7-2. Intermittently Flooded Field in the Eastern Part of the Habitat Area (facing southeast August 12, 2008)

Aquatic Resources. The Building 1200 AOC has few aquatic resources. Although there are no ponds or streams at the Building 1200 AOC, there is one shallow drainage ditch and one small wetland.

Habitat Descriptions and Species. The shallow drainage ditch extends from the location of the former buildings to the former settling pond. This drainage ditch is about 500 ft long, and the water flows in the east-northeasterly direction. During most of the year, there is no water in the drainage ditch, but there was standing water in this drainage ditch following the week's rainstorms when two SAIC field biologists visited the habitat area during the PBA08 RI on May 18, 2010. Precipitation data for RVAAP are provided in Section 3.5. The storm frequency is 35 days per year and precipitation occurs 154 days per year. This is not a sufficient amount of precipitation to create and maintain aquatic habitat at the Building 1200 AOC, as evidenced by the lack of such habitat.

There is no large drainage outlet from the former settling pond. However, there is a small overflow outlet and drainage area on the southern edge of the former settling pond. This drainage area fans out into the forest within a few feet of the perimeter of the former settling pond. Little surface water was present in this area on August 12, 2008, but some was present on May 18, 2010 after the week's rainstorms.

Wetlands. There is one habitat type of intermittently flooded early-succession herbaceous field in the northeast corner of the Building 1200 AOC (Figures 7-1 and 7-2) (OHARNG 2008). This habitat type coincides with a small, emergent, planning level survey wetland covering 0.39 acres. Hereafter, the habitat type will be called a wetland. No jurisdictional wetlands determination has been conducted at this AOC. For any wetland at the AOC potentially affected by remedial activities, a jurisdictional determination by USACE would be required to determine the regulatory status.

The wetland is forming in a portion of the former settling pond constructed to receive storm water runoff from the Building 1200 AOC. The area has been heavily impacted by the earthmoving activities associated with construction of the former settling pond (and the subsequent forming of a wetland). The former settling pond is surrounded by an earthen berm with breaks for the inlet and outlet. The wetland receives water from a drainage ditch that flows approximately 500 ft from the location of the former buildings. Water discharges from the southeast side of the wetland into a wet weather conveyance. Vegetation includes emergent plants such as cattails (*Typha latifolia*), spikerush (*Eleocharis* spp.), steeplebush (*Spiraea tomentosa*), and silky dogwood (*Cornus amomum*). The wetland is still in an early stage of development within the former settling pond.

An SAIC Professional Wetland Scientist used the ORAM (Ohio EPA 2001) in May 2010 to assess the condition of any planning level survey wetlands at the Building 1200 AOC and to determine the potential ecological importance of those wetlands (Appendix H, Figure H-2). Using the ORAM, wetlands are classified into three categories.

- Category 1 wetlands are described as "limited quality waters." They are considered to be a resource that has been degraded, have limited potential for restoration, or are of such low

functionality that lower standards for avoidance, minimization, and mitigation can be applied. Scores range from 1 to 29.

- Category 2 includes wetlands of moderate quality and wetlands that are degraded but exhibit reasonable potential for restoration. Scores range from 30 to 59.

- Category 3 generally includes wetlands of very high quality and wetlands of concern regionally and/or statewide, such as wetlands that provide habitat for species listed as threatened or endangered. Scores range from 60 to 100.

The field sheets detailing the ORAM at the Building 1200 AOC are presented in Appendix H (Figure H-2). The wetland at this AOC is classified as Category 1 (with a final score of 23), which indicates impaired wetland conditions and functions.

Wetlands are important habitats with water-saturated soil or sediment whose plant life can survive saturation. Wetlands are home to many different species and are also chemical sinks that can serve as detoxifiers and natural water purifiers. It is expected that the wetland at the Building 1200 AOC performs these and other related functions.

Threatened and Endangered and Other State-listed and Federally-listed Species. The Building 1200 AOC has not been previously surveyed for state-listed and federally-listed species. There have been no documented sightings of threatened or endangered species at the AOC (OHARNG 2008).

Other Aquatic Resources. While there are no other known aquatic resources at or near the Building 1200 AOC (e.g., vegetation, animals), the existing populations interact in their ecosystems and support nutrient cycling and energy flow. The nearest biological and water quality station is about 2,000 ft away, and there is no connecting stream to the AOC. Aside from the vegetation map in the INRMP as shown in Figure 7-2, there are no other reported surveys of habitats and wildlife at the Building 1200 AOC.

Ecosystem and Landscape Roles and Relationships. There are four spatial areas evaluated to assess the ecosystem and landscape roles and relationships: the actual AOC, the vicinity of the AOC, the entire RVAAP, and the northeastern or ecoregion of Ohio. Information about the first spatial area (the actual AOC) was provided in the section above on terrestrial and aquatic resources.

Vicinity of the AOC. The same dominant forest type – the American beech (*Fagus grandifolia),* the sugar maple (*Acer saccharum*), and American tulip tree (*Liriodendron tulipifera*) – occurs in all directions beyond the AOC for at least 500 ft from the outer edge of the habitat area. This forest type makes up part of the 700 acres of mixed mature woods in the special interest area surrounding the Building 1200 AOC. In the approximately 7.7 acres of the AOC, the quality of the forest appears to be typical of other forests in RVAAP; inside the habitat area there are no noticeably larger trees or more dense growth than immediately outside the habitat area.

Figure 7-2 shows a wetland 100 ft northeast of the AOC. The nearest stream is approximately 1,200 ft south of the AOC. The nearest 100-year floodplain is approximately 1,400 ft west of the AOC. The nearest stream sampling station from the Ohio EPA/USACE Biology and Water Quality Study (USACE 2005b) is approximately 2,000 ft west of the AOC, with the nearest pond sampling station even farther away (Table 7-13). There is no pond or stream on the AOC, and the nearest beaver dam is 2,200 ft southeast of the AOC. Thus, the only important aquatic resource at or near the AOC is wetlands.

The closest recorded state-listed or federally-listed species [barn owl (*Tyto alba*)] is located approximately 940 ft east of the AOC (Table 7-13). It is a state threatened species. The next closest state-listed or federally-listed species [mountain brook lamprey (*Ichthyomyzon greeleyi*)] is located approximately 1,900 ft west of the AOC. It is a state endangered species.

Table 7-13 summarizes the geographical relationships of various ecological resources in the vicinity of the AOC, where only wetlands and the special interest area are found at or in the vicinity of the AOC. Most of the nearest resources are more than 1,500 ft away.

The Entire RVAAP. The Building 1200 AOC is approximately 7.7 acres in size. This represents about 0.03% of the entire area of RVAAP (approximately 21,683 acres in size). There are approximately 1,970 acres of wetlands (jurisdictional and planning level survey) as defined in the INRMP (OHARNG 2008), representing 9.1% of the habitat at RVAAP. The special interest area is about 700 acres in size and occupies about 3.2% of RVAAP. There is approximately 1,440 acres of the American beech (*Fagus grandifolia)*, sugar maple (*Acer saccharum)*, and American tulip tree (*Liriodendron tulipifera*) forest at RVAAP (OHARNG 2008). This represents about 6.6% of the vegetation types at RVAAP being the same forest type as at the Building 1200 AOC. Thus, this type of resource is abundant and is not unique at the Building 1200 AOC, Camp Ravenna, and RVAAP. Additionally, there are about 253 acres of landscaped/maintained grounds surrounding buildings and about 80 acres of intermittently flooded early-successional herbaceous field habitat at RVAAP. Thus, the types of habitat are not unique to the Building 1200 AOC.

Table 7-13. Survey of Proximity to the AOC of Various Ecological Resources

Natural Resource	Inside Habitat Area	Near the AOC	Distances to Nearest Resource[a] and Comments
Wetlands (Planning Level Survey)	Yes (small)	Yes (near NE corner)	Small; low quality (Category 1) wetland present Other in vicinity
State-listed or federally-listed species	No known sightings	None	940 ft E; 1,900 W; See text for species names
Beaver dams	None	None	2,200 ft SE; 3,100 ft WNW
100-year floodplain	None	None	1,400 ft W
Stream sampling[b]	None	None	Important water feature located 2,000 ft W
Pond sampling[b]	None	None	Important water feature located 4,500 ft SW

[a] Measurements of distance and direction are taken from the nearest boundary of the AOC to the resource being measured.
[b] Stream and pond sampling refers to *Facility-Wide Biological and Water Quality Study 2003* (USACE 2005b).
AOC = Area of Concern

Ecoregion. In the area surrounding RVAAP, forests occupy a high percentage of the terrain. For example, Ohio's forests cover approximately 8,000,000 acres or 30% of the state (USDA 2009). The Erie/Ontario Drift and Lake Plain ecoregion (USEPA 2011) is located in the northeastern part of Ohio that contains the forest alliance of American beech (*Fagus grandifolia*), sugar maple (*Acer saccharum*), and American tulip tree (*Liriodendron tulipifera*). This ecoregion is made up of rolling to level terrain and low lime drift and lacustrine deposits. Lakes, wetlands, and swampy streams occur where stream networks converge or where the land is flat and clayey (USEPA 2011). The same ecoregion and forest alliance is found throughout northeastern Ohio and also in Cuyahoga, Geauga, Mahoning, Portage, Stark, Summit, and Trumbull counties that surround RVAAP. The United States Forest Service (USFS) has a Forest Inventory Data Online tool that was queried for the forest alliance in the surrounding counties in or near RVAAP (USFS 2011). In 2009, a total of 171,384 acres were present in Cuyahoga, Geauga, Mahoning, Portage, Stark, Summit, and Trumbull counties for maple and beech classifications (USFS 2011). The American tulip tree (*Liriodendron tulipifera*) is found throughout all of Ohio (Kloss 2011 and ODNR 2011). A total of 207,814 acres of intermittently flooded early-successional herbaceous fields (wetlands) are in Portage County and surrounding counties (USEPA 1999). Portage County (49,469 acres) and Trumbull County (60,816 acres) have the most acreage of wetlands of the seven surrounding counties. For landscaped/maintained grounds, Portage County has the lowest percent (12.79% of 315,136 acres), while Cuyahoga County has the highest percent (66.58% out of 293,312 acres) of the seven counties (ODNR 2011). Thus, the forest alliance and other habitat types at the Building 1200 AOC are also found in the surrounding counties in the ecoregion of northeastern Ohio.

In summary, the forest type of American beech (*Fagus grandifolia*), sugar maple (*Acer saccharum*), and American tulip tree (*Liriodendron tulipifera*) is found in the vicinity of the Building 1200 AOC. At the AOC and other nearby places, the forest type is part of the special interest area of mixed mature woods. Also, the same type of forest and other habitat types are found at RVAAP and the larger surrounding local ecoregion.

7.3.2.4 Summary and Recommendations of Scoping Level Ecological Risk Assessment

Based on the historical ERA, there were 14 soil COPECs, 5 sediment COPECs, and 6 surface water COPECs. The majority of these COPECs were inorganic chemicals. Some of these chemicals are considered COPECs because the chemical does not have an ESV.

The U.S. Army and Ohio EPA provide a checklist of important ecological places and resources to determine if such ecological resources are present on an AOC and nearby. The entire Building 1200 AOC is included in and surrounded by a special interest area of mixed mature woods. There is also a wetland at the AOC. Environmental management goals and objectives of OHARNG are applicable to the Building 1200 AOC, including Goal 1 that requires management of natural resources to be compatible with military mission, and Goal 5 that requires the U.S. Army to sustain usable training lands and native natural resources by implementing a natural resource management plan, which incorporates invasive species management, and utilizing native species mixes for re-vegetation after ground disturbance activities.

The Building 1200 AOC is made up of 7.7 acres of a mixed forest (American beech, sugar maple, and American tulip tree), a cleared field that was the location of former buildings, and an intermittently flooded field that contains a former settling pond. The former settling pond contains a small wetland with cattails, spikerush, steeplebush, and silky dogwood. The vegetation types in the Building 1200 AOC are found nearby, at RVAAP, and in the ecoregion.

Due to the fact that: (1) there is contamination at the Building 1200 AOC; and (2) important or ecologically significant resources in the form of a special interest area and wetland are both present, this ERA will continue to a Level II Screening Level ERA.

7.3.3 Level II: Screening Level Ecological Risk Assessment

The Level II method follows the guidance documents listed in Section 7.3.1. The Level II method identifies evaluation procedures used for problem formulation and ecological effects evaluation to determine AOC-related COPECs. This work includes defining habitats/environmental setting, suspected contaminants, possible pathways, and mechanisms for ecotoxicity and contaminant transport. Level II also includes establishing screening values.

In addition, technical and refinement factors can be used to assess outcomes of the above procedures. The factors include use of mean exposure concentrations, discussion of approved ESVs, wetland quality at the AOC, and other topics that evaluate and refine the COPECs from the Level II Screening ERA. This type of assessment is called Step 3A in the ERA process (USEPA 1997).

7.3.3.1 Generic Ecological Conceptual Exposure Model

The Conceptual Site Exposure Model (CSEM) identifies the interconnections of contaminant sources and transport mechanisms for contaminant migration through the environment to the receptors. The CSEM provides an understanding of the relationships of all sources, release and transport pathways, potential exposure media, and receptors. The CSEM includes:

- **Source Media.** Based on historical AOC information, operations associated with various former buildings at the Building 1200 AOC are the contaminant source. The operations contributed chemicals to: 1) the surrounding soil and the former settling pond that contained sediment and occasionally surface water; or 2) the sediment and occasional surface water directly.

- **Transport Mechanisms.** Material in soil and/or groundwater can migrate via erosion and leaching. Migration to sediment and surface water via erosion is controlled by the amount of precipitation, type of ground cover, and topography of the AOC. Little erosion is expected to occur at the AOC because the land is relatively flat and has extensive vegetative cover. This extensive vegetative cover includes forests and herbaceous fields. Much of the precipitation landing on this area is expected to leach or infiltrate the soil, and some precipitation would likely go through the southern berm opening at the former settling pond.

- **Exposure Media.** Exposure media are media where contaminants are available for exposure to ecological receptors. Potential exposure media at the Building 1200 AOC are soil, sediment, occasional surface water, vegetation, and animals.

- **Exposure Pathways.** A main exposure pathway is ingestion of contaminated food. Other pathways may include ingestion of soil, sediment, and water and dermal contact by receptors with soil, sediment, or water. There are no permanent ponds or streams on the AOC; however, there is a drainage ditch traversing the center of the AOC and a former settling pond in the eastern part of the AOC. SAIC scientists observed surface water in the drainage ditch and the former settling pond after rainstorms, but the water in both features is ephemeral based on the observations by SAIC scientists and the vegetation classifications in the INRMP (OHARNG 2008).

- **Ecological Receptors.** A variety of ecological receptors, such as terrestrial birds and mammals, are present in the area. Receptors associated with various published toxicological endpoints are assumed to represent these various plants and animals.

7.3.3.2 Habitats and Species (Including Generic Receptors)

Habitats and species were defined in the Level I ERA (Section 7.3.2). For example, three types of habitats were described. Habitats, species, and other resources were analyzed, and it was determined that important or significant ecological resources are present at the Building 1200 AOC and vicinity. A wetland is present, and a special interest area of mixed mature woods surrounds the AOC. Contamination is present and, thus, a Level II analysis is needed. Level II assumes ecological receptors are sensitive to various chemicals based on a variety of toxicological data from field-observed effects and laboratory tests. The ESV is utilized as a toxicity metric representing multiple generic receptors, including plants, microorganisms, and animals.

7.3.3.3 Procedure to Identify COPECs

The screening level approach to evaluate sample results from the PBA08 RI followed a similar approach used in the historical ERA. Section 5.1 of this RI/FS report details chemical concentration data. The PBA08 RI included collection of discrete surface soil (0-1 ft bgs) samples, ISM surface soil (0-1 ft bgs) samples, and discrete sediment samples at locations different from the historical sample locations. Discrete samples and ISM samples are not combined in the PBA08 RI COPEC screening, and only ISM soil samples collected during the PBA08 RI and ISM soil and sediment samples collected during the historical ERA were used in the analysis. This ERA uses updated sediment reference values (SRVs) (Appendix Table H-6) and ESVs that follow the revised *Ecological Risk Assessment Guidance* (Ohio EPA 2008), as provided in Appendix Tables H-7 and H-8.

The hierarchy of ESVs is based on the information found in the Ohio EPA risk assessment guidance (Ohio EPA 2008) and FWERWP (USACE 2003c). The MDC of each chemical is compared to its respective facility-wide background concentration. Sediment concentrations are also compared to the SRV. Chemicals are not considered site-related if the MDC is below the background concentration.

For all chemicals detected above background concentrations, the MDC is compared to the chemical-specific ESV. In addition to the ESV comparison, it was determined if the chemical is a PBT compound. Chemicals are retained as COPECs if they exceed background concentrations (and SRV for sediment) and the ESV, if the chemical exceeds background concentrations (and SRVs) and had no toxicity information, or if the chemical is considered a PBT compound. Ratios of MDC to ESV are used to determine the integrated COPECs that result from the combined current and historical datasets. A ratio greater than 1 suggests a possible environmental consequence. Any chemicals with ratios greater than 1 are identified as integrated COPECs.

Maximum Detected Concentrations. The MDCs were compared to background concentrations and ESVs (Appendix Tables H-7 and H-8) for each detected chemical. These comparisons are provided in Appendix Table H-9 for soil and Appendix Table H-10 for sediment.

Ecological Screening Values. Although the historical ERA used ESVs from the 2003 version of the *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2003), this ERA uses updated ESVs from the 2008 version of this guidance document. The hierarchy for soil is Ecological Soil Screening Levels (EcoSSLs), PRGs, and Ecological Screening Levels (ESLs). The hierarchy for sediment is the Sediment Quality Guidelines (SQG) followed by ESLs. When needed, the hierarchy for surface water is the Ohio EPA Water Quality Criteria (WQC), National Recommended Water Quality Criteria (NRWQC), and ESLs. Appendix H provides for values and sources for ESVs in Tables H-7 and H-8.

7.3.3.4 Integrated COPECs for Soil (0-1 ft bgs)

During the PBA08 RI, forty chemicals were detected in surface soil. Five chemicals (calcium, iron, magnesium, potassium, and sodium) were essential nutrients and were excluded as SRCs, as described in Section 5.1. Fourteen detected inorganic chemicals and 18 organic chemicals were determined to be SRCs because they either exceeded background concentrations or did not have an associated background concentration for comparison. Of the 32 SRCs, 10 inorganic chemicals (aluminum, cadmium, chromium, cobalt, copper, lead, manganese, mercury, selenium, and zinc) exceeded the ESVs and are identified as integrated COPECs (Table 7-14). In addition, 4 organic chemicals (TNT, HMX, RDX, and nitrocellulose) were selected as integrated COPECs because they do not have an ESV. One of the integrated COPECs (mercury) was also a PBT compound. The calculated ratio of MDC to ESV is shown in Table 7-14 for each integrated COPEC. Appendix Table H-9 presents the details of the ESV comparisons for surface soil.

Table 7-14. Summary of Integrated COPECs for Surface Soil

COPEC	MDC (mg/kg)	ESV (mg/kg)	Ratio of MDC to ESV	Comments
Aluminum	30,000	50	600	Highest ratio at 600X
Cadmium	3.3	0.36	9.2	None
Chromium	36.1	26	1.4	None
Cobalt	15	13	1.2	None

Table 7-14. Summary of Integrated COPECs for Surface Soil (continued)

COPEC	MDC (mg/kg)	ESV (mg/kg)	Ratio of MDC to ESV	Comments
Copper	71	28	2.5	None
Lead	86	11	7.8	None
Manganese	4100	220	18.6	Third highest ratio at nearly 20X
Mercury	0.1	0.00051	196	Second highest ratio at nearly 200X
Selenium	1.6	0.52	3.1	None
Zinc	180	46	3.9	None
TNT	0.28	No ESV	--	None
HMX	11	No ESV	--	None
RDX	13	No ESV	--	None
Nitrocellulose	0.87	No ESV	--	None

Table excludes nutrients
-- = not applicable, no ESV is available for comparison.
COPEC = Chemical of Potential Ecological Concern
ESV = Ecological Screening Value
HMX = octahydro-1,3,5,7-tetranitro-1,3,5,7-tetrazocine
MDC = Maximum detected concentration
RVAAP = Ravenna Army Ammunition Plant
RDX = hexahydro-1,3,5-trinitro-1,3,5-triazine
TNT = 2,4,6-trinitrotoluene
X = multiplier

Most of the soil COPECs reported in the historical ERA (Table 7-12) are also identified in the current ERA. The historical ERA (Characterization of 14 AOCs) identified two COPECs (barium and iron) that are not integrated COPECs. Barium was below the new ESV (Ohio EPA 2008, Appendix Table H-9), and iron was considered an essential nutrient in the new dataset. Two new integrated COPECs (cadmium and cobalt) are identified in the PBA08 RI. The addition of cadmium and cobalt are due to updated, more protective ESVs. Based on the presence of integrated COPECs, this ERA predicts the potential for ecological risk in soil.

7.3.3.5 Integrated COPECs for Sediment

During the PBA08 RI, 26 chemicals were detected in sediment. Sediment ESVs are published in Appendix H, Table H-8. Detected chemical concentrations were compared to the sediment background concentrations, SRVs, and ESVs (Appendix H, Table H-6, H-8, and H-10), and the results are summarized in Table 7-15. Five integrated COPECs were identified in sediment. Mercury, lindane, and acetone exceeded their ESVs, while beryllium and nitrocellulose were COPECs because they do not have an ESV.

Table 7-15. Summary of Integrated COPECs in Sediment

COPEC	MDC (mg/kg)	ESV (mg/kg)	Ratio of Maximum to ESV	Comments
Beryllium	0.86	No ESV	--	None
Mercury	0.2	0.18	1.1	Just barely exceeds ESV
Nitrocellulose	1.7	No ESV	--	None
Lindane	0.013	0.00237	5.5	Second highest ratio at 5.5X
Acetone	0.084	0.0099	8.48	Highest ratio at 8.5X

Table excludes nutrients
-- = not applicable, no ESV available.
X = multiplier
ESV = Ecological Screening Value
COPEC = Chemical of Potential Ecological Concern
MDC = Maximum Detected Concentration

Table 7-15 identifies the integrated COPECs for sediment. Beryllium, mercury, nitrocellulose, lindane, and acetone were identified as COPECs using historical ISM data and become integrated COPECs.

7.3.3.6 Integrated COPECs for Surface Water

There is intermittent surface water at the Building 1200 AOC in the shallow drainage ditch and the former settling pond. Photographs in Appendix H show water the day following several rainstorms. Rainstorms are insufficient to create and maintain aquatic habitat at the Building 1200 AOC. Thus, there are no natural or permanent ponds and no streams at this AOC. Historical surface water samples collected in 2004 were used for the nature and extent evaluation but were not included in data screens. The historical COPECs (based on 2004 surface water data) are not considered integrated COPECs. No ERA for surface water is needed due to the lack of fish and other aquatic organisms.

7.3.3.7 Step 3A: Refinement of Integrated COPECs

Step 3A refines the list of integrated COPECs to determine if 1) there are final COPECs requiring further evaluation in Level III or remediation to protect ecological receptors; or 2) integrated COPECs can be eliminated from further consideration. This section applies and evaluates refinement factors agreed upon by USACE and Ohio EPA to the integrated COPECs for the AOC. This evaluation is an important part of Level II and is adapted from USEPA Step 3A, outlined in *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments* (USEPA 1997) and *Risk Assessment Handbook Volume II: Environmental Evaluation* (USACE 2010b). The purpose of Step 3A is stated as follows by the U.S. Army (BTAG 2005):

> "The results of Step 3A will be used to determine if threats to ecological receptors are negligible and an appropriate risk management decision may be made to end the ERA process, or potential threats are still indicated and a BERA should be initiated."

The evaluation and refinement factors used in Step 3A are presented below.

- Comparison of average or mean concentration to ESV;
- Comparison of mean concentration to background concentration;
- Comparison of background concentration to ESV;
- Frequency of chemical occurrence relative to ESV;
- Magnitude of ESV exceedance (ratio of ESV to chemical concentrations);
- Discussion of Ohio EPA approved and preferred ESVs;
- Qualitative relationship of exposure area to general home range;
- Category of wetland quality inside the AOC;
- Geographical relationship of on-site wetlands to AOC exceedance area;
- Information about on-site migration of chemicals to on-site wetlands; and
- Evaluation of off-site migration of chemicals at biological/water quality stations.

For soil at the Building 1200 AOC, there are 14 integrated COPECs. There are 10 integrated COPECs based on maximum exposure and ESV exceedance: aluminum, cadmium, chromium, cobalt, copper, lead, manganese, mercury, selenium, and zinc. There are four integrated COPECs (TNT, HMX, nitrocellulose, and RDX) identified because they do not have an ESV. However, chemicals with no ESVs are addressed in the uncertainty section (Section 7.3.3.9). Therefore, they are eliminated from further consideration and will not be final COPECs.

For sediment, mercury, lindane, and acetone are integrated COPECs based on maximum exposure, as the MDC for both chemicals exceeded their ESVs. Beryllium and nitrocellulose were sediment integrated COPECs because they do not have an ESV. Surface water is not present year round at Building 1200; therefore, there are no surface water COPECs.

The first four evaluation and refinement factors are organized to compare key quantitative information. These factors are:

- Comparison of average or mean concentration to screening benchmark or ESV;
- Comparison of mean concentration to background concentration;
- Comparison of background concentration to ESV; and
- Frequency of chemical occurrence relative to ESV.

Multiple evaluation factors can be used to define whether an integrated COPEC should be retained or eliminated from further consideration. There are two types of comparisons and associated decisions in the first steps of the refinement process (Table 7-16).

Table 7-16. Application and Decisions of Selected Evaluation Factors to Integrated COPECs for Surface Soil from Level II

Action	Condition for Decision to Dismiss or Retain COPEC	Outcome
Compare mean concentration to ESV	(A) Mean concentration smaller than or equal to the ESV	COPEC is not a candidate to be a final COPEC. Evaluation ceased.
	(B) Mean concentration larger than the ESV	Continue evaluation of chemical.
Compare mean concentration above ESV to background concentration	(A) Mean concentration smaller than the background concentration	COPEC is not a candidate to be a final COPEC. Evaluation ceased.
	(B) Mean concentration larger than background concentration	Continue evaluation of chemical.

COPEC = Chemical of Potential Ecological Concern
ESV = Ecological Screening Value

Comparison of background concentrations to ESV is also an important consideration in this part of the evaluation. Additionally, frequency of detection is provided. The evaluations are presented by type of decision on a COPEC-by-COPEC basis. These evaluations are followed by the application of additional evaluation and refinement factors, when necessary.

Comparison of Mean Concentration to ESV. Three integrated COPECs (chromium, cobalt, and copper) in soil are eliminated in this step because the mean concentration is smaller than the ESV (Appendix Table H-11). Each eliminated integrated COPEC is discussed relative to the mean concentration being smaller than the ESV and the related evaluation and refinement factors. Table 7-17 shows the principal data and various comparisons.

***Chromium*.** Chromium was detected in all 13 ISM samples at the Building 1200 AOC, but only 3 samples (B12ss-017M, -037M, and -038M) had chromium concentrations exceeding the ESV (Table 7-17). One of these three samples is located near the former buildings, and the other two samples were collected in the drainage ditch. Although the MDC for chromium in surface soil exceeds the background concentration and ESV, the mean concentration is less than the ESV. Therefore, chromium is eliminated from further consideration and will not be a final COPEC.

Cobalt. Cobalt was detected in all 13 ISM samples at the Building 1200 AOC. Only four samples were above the background concentration, and only two of these samples (B12ss-022M and -036M) had cobalt concentrations exceeding the ESV (Table 7-17). The samples were located near the former buildings and the former settling pond. Although the MDC for cobalt in surface soil exceeds the background concentration and ESV, the mean concentration is less than the ESV and background concentration. Therefore, cobalt is eliminated from further consideration and will not be a final COPEC.

Copper. Copper was detected in all 13 ISM samples at the Building 1200 AOC. Only four samples were above the background concentration, and only one sample (B12ss-017M) had a copper concentration exceeding the ESV (Table 7-17). This sample is located near the former buildings. Although the MDC for copper in surface soil exceeds the background concentration and ESV, the mean concentration is less than the ESV and only slightly higher than the background concentration. Therefore, copper is eliminated from further consideration and will not be a final COPEC.

In summary, chromium, cobalt, and copper were eliminated from further consideration. The other seven integrated COPECs in soil have mean concentrations larger than the ESV.

Table 7-17. Summary of Data for Step 3A Refinement of Integrated COPECs in Surface Soil at the Building 1200 AOC

COPEC	Mean Concentration (mg/kg)	ESV (mg/kg)	Mean Concentration > ESV? (Yes/No)	Background Concentration (mg/kg)	Mean Concentration> Background Concentration? (Yes/No)	ESV > Background Concentration? (Yes/No)	Frequency of Detections > ESV	Frequency of Detections > Background Concentration	Further Evaluation in Level II Required? (Yes/No)
COPEC with Mean Concentration < ESV									
Chromium	24.4	26	No	17.4	Yes	Yes	3/13	13/13	No
Cobalt	9.1	13	No	10.4	No	Yes	2/13	4/13	No
Copper	19.8	28	No	17.7	Yes	Yes	1/13	4/13	No
COPEC with Mean Concentration > ESV and Mean Concentration < Background Concentration									
Aluminum	14,700	50	Yes	17,700	No	No	13/13	1/13	No
Manganese	1,190	220	Yes	1,450	No	No	13/13	3/13	No
Selenium	0.96	0.52	Yes	1.4	No	No	10/10	1/10	No
COPEC with Mean Concentration > ESV and Mean Concentration > Background Concentration									
Cadmium	0.43	0.36	Yes	0	Yes	Yes	3/8	8/8	Yes
Lead	30.1	11	Yes	26.1	Yes	No	13/13	4/13	Yes
Mercury	0.045	0.00051	Yes	0.036	Yes	No	10/10	8/10	Yes
Zinc	92	46	Yes	61.8	Yes	No	13/13	10/13	Yes

COPEC = Chemical of Potential Ecological Concern
ESV = Ecological Screening Value

Comparison of Mean Concentration Above ESV to Background Concentration. Three integrated COPECs (aluminum, manganese, and selenium) in surface soil are eliminated in this step because the mean concentration is larger than the ESV but smaller than the background concentration. Each COPEC is discussed relative to the various evaluation and refinement factors.

Aluminum. Aluminum in surface soil at the Building 1200 AOC has a mean concentration less than the background concentration (Table 7-17). The background concentration is 350 times greater than the ESV. Although aluminum was detected in all 13 ISM samples at concentrations above the ESV, only one sample (B12ss-016M) exceeded the background concentration. Having only one sample exceed the background concentration suggests the concentration of aluminum in surface soil is not a likely concern. The ESV is conservative, as the ESV is 350 times lower than the background concentration. Additionally, aluminum is not a concern because the soil pH is too high to dissociate the chemical. A typical soil pH is 6.0-7.0 at one of the nearby load lines at RVAAP (USACE 2004b). Regarding aluminum chemistry and ecological risk in soil, the USEPA stated "Aluminum is identified as a COPC only for soil with a pH less than 5.5" (USEPA 2003a). Therefore, because the mean concentration is less than the background concentration, the ESV is rather conservative, and the soil pH at RVAAP is higher than the USEPA dissociation limit, aluminum is eliminated from further consideration and will not be a final COPEC.

Manganese. Manganese in surface soil at the Building 1200 AOC has a mean concentration less than the background concentration, and the background concentration is 6 times greater than the ESV (Table 7-17). Because the ESV is lower than the background concentration, the ESV can be considered conservative. Manganese was detected in all 13 ISM samples at concentrations above the ESV; however, only three samples (B12ss-016M, -017M, and -022M) exceeded the background concentration. Although the MDC for manganese in surface soil exceeds the background concentration and the ESV, the mean concentration is below the background concentration, and the ESV is conservative. Therefore, manganese is eliminated from further consideration and will not be a final COPEC.

Selenium. Selenium in surface soil at the Building 1200 AOC has a mean concentration less than the background concentration. The background concentration is more than 2 times greater than the ESV. Because the ESV is lower than the background concentration, the ESV can be considered conservative. Selenium was detected in 10 of 13 ISM samples at concentrations above the ESV; however, only one sample (B12ss-016M) exceeded the background concentration (Table 7-17). Although the MDC for selenium in surface soil exceeds the background concentration and the ESV, the mean concentration is below background and the ESV is conservative. Therefore, selenium is eliminated from further consideration and will not be a final COPEC.

Continued Evaluations. The remaining four integrated COPECs (cadmium, lead, mercury, and zinc) in soil have mean concentrations greater than the ESV and background concentration. Each remaining integrated COPEC is presented below and discussed relative to the first four and related evaluation and refinement factors.

Cadmium. Cadmium in surface soil at the Building 1200 AOC has a mean concentration greater than the background concentration, and the background concentration is less than the ESV (cadmium was not detected in background). Cadmium was detected in 8 of 13 ISM samples at the Building 1200 AOC, but only 3 of these samples (B12ss-016M, -017M, and -018M) had cadmium concentrations exceeding the ESV (Table 7-17). These three samples are clustered near the former buildings. The numerical distribution of cadmium concentrations exceeding the

ESV and background concentration in surface soil indicates that cadmium requires further evaluation as a COPEC.

Lead. Lead in surface soil at the Building 1200 AOC was detected above the background concentration in 4 of 13 ISM samples, and the mean concentration is only slightly greater than the background concentration. The ESV is lower than the background concentration which indicates that the ESV for lead may be conservative. Of the four samples exceeding the ESV and background concentration (B12ss-013M, -017M, -018M and -021M) (Table 7-17), the one sample (B12ss-017M) with the highest lead concentration (86 mg/kg) is located near the former buildings (Figure 5-2). Although the ESV may be conservative, the mean concentration for lead in surface soil exceeds both the background concentration and ESV. Lead requires further evaluation as a COPEC.

Mercury. Although mercury in surface soil at the Building 1200 AOC has a mean concentration slightly greater than the background concentration, the background concentration is 70 times greater than the ESV. Mercury, a PBT compound, was detected above the background concentration in 8 of 13 ISM surface soil samples (Table 7-17). Most of these samples are clustered near the former buildings. The ESV is much lower than the background concentration, which indicates the ESV may be very conservative. Although there is a small area of distribution of mercury concentrations in surface soil and mercury has a very conservative ESV, the mean concentration for mercury exceeds both the background concentration and ESV. Mercury requires further evaluation as a COPEC.

Zinc. Zinc in surface soil at the Building 1200 AOC has a mean concentration greater than the background concentration, and the background concentration is greater than the ESV. Zinc was detected above the ESV in all 13 ISM samples and above the background concentration in 10 of 13 samples (Table 7-17). The ESV is lower than background concentration, which indicates the ESV may be conservative. The mean concentration in surface soil exceeds both the background concentration and the ESV. Zinc requires further evaluation as a COPEC.

These four remaining integrated COPECs (cadmium, lead, mercury, and zinc) for soil require further evaluation because the mean soil concentration is higher than the ESV and background concentration.

Additional Technical and Refinement Factors. The next three evaluation and refinement factors include:

- Magnitude of ESV exceedance (ratio of ESV to chemical concentrations);
- Discussion of Ohio EPA approved and preferred ESVs; and

- Qualitative relationship of exposure area to general home range.

Magnitude of ESV Exceedance. Although the mean concentration to ESV ratios for cadmium (1.2), lead (2.7), mercury (88.6), and zinc (2.0) indicate a possibility of risk, most of the ratios are relatively small (Appendix Table H-9). The small ratios for cadmium, lead, and zinc indicate that toxicity is relatively low and they may not become final COPECs. As stated by Ohio EPA (2008), "If only minor exceedances are detected and other evidence can substantiate, a claim may be made that some or all of the site-associated soils have not been impacted and no additional ecological investigation of the soils is warranted."

Comparison of Ohio EPA Approved and Preferred ESVs. The *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2008) gives specific guidance on selection of media screening values (ESVs) for Level II evaluation. For soil, three possible sources of ESV values are listed in order of preference: 1) *USEPA Ecological Soil Screening Levels* (EcoSSLs), 2) *Preliminary Remediation Goals for Ecological Endpoints* (DOE 1997) and 3) *Region 5 Ecological Screening Levels* (USEPA 2003b). However, it is important to note that the preferred source (EcoSSLs) can have up to four values per chemical, one for each receptor type (plants, soil invertebrates, birds, and mammals). Ohio EPA does not provide guidance on which value to select of these four, so the most conservative (lowest) value was chosen for this ERA. However, since all of these sources are approved in the guidance and the EcoSSL value to be used in Level II is not specified, it is possible that the chosen ESV is too conservative. Alternative ESVs are presented below for the remaining four COPECs.

The cadmium ESV used in this ERA is 0.36 mg/kg. This concentration is considered the Ohio EPA approved and preferred ESV for cadmium in accordance with the *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2008); the ESV originated from the *Ecological Soil Screening Levels for Cadmium* (USEPA 2005a). The USEPA EcoSSL guidance document is Ohio EPA's preferred source of ESVs (Appendix Table H-7). The cadmium ESV used in this ERA is the most conservative ESV of the USEPA EcoSSLs. Other possible EcoSSLs for cadmium include 0.77 mg/kg, 32 mg/kg, and 140 mg/kg (USEPA 2005a). The ESV of 0.36 mg/kg is more than 10 times lower than the ESV (4.0 mg/kg) from *Preliminary Remediation Goals for Ecological Endpoints* (DOE 1997), considered the next source of ESVs preferred by Ohio EPA (Appendix Table H-7), which is almost 10 times the mean concentration (0.43 mg/kg) for cadmium. This information indicates that the Ohio EPA approved and preferred ESV for cadmium is conservative; thus, the selection of cadmium as a COPEC is conservative.

The Ohio EPA approved and preferred lead ESV used in this ERA is 11 mg/kg. This ESV is also from the USEPA EcoSSLs (Appendix Table H-7). The lead ESV used in this ERA is the most conservative ESV of the USEPA EcoSSLs. Other EcoSSLs for lead include 56 mg/kg, 120 mg/kg, and 1,700 mg/kg (USEPA 2005b). The ESV of 11 mg/kg is about 4 times lower than the ESV from the next source preferred by Ohio EPA (40.5 mg/kg) (Appendix Table H-7) (DOE 1997). The ESV used for lead is also lower than the background concentration of 26.1 mg/kg (Appendix Table H-9). This information indicates that the Ohio EPA approved and preferred ESV for lead, and thus the selection of lead as a COPEC, is very conservative.

The Ohio EPA approved and preferred mercury ESV used in this ERA is 0.0005 mg/kg (Appendix Table H-7). The ESV is lower than other ESVs for mercury (0.1 mg/kg), the ESV for methylmercury (0.0016 mg/kg) (USEPA 2000, USEPA 2001, USEPA 2003b) (Appendix Table H-7), and lower than the background concentration (0.036 mg/kg) (Appendix Table H-9). The *Preliminary Remediation Goals for Ecological Endpoints* labels the form of mercury as an "inorganic chemical" and notes that the ESV for mercury is "…so low that it may often be within background soil concentrations" (DOE 1997). Although mercury can bioaccumulate in food chains as a PBT compound, the Ohio EPA approved and preferred ESV is very low; thus, the selection of mercury as a COPEC is very conservative.

The Ohio EPA approved and preferred zinc ESV used in this ERA is 46 mg/kg. This value is from the USEPA EcoSSLs (Appendix Table H-7) (USEPA 2007). The zinc ESV used in this ERA is the most conservative ESV of the USEPA EcoSSLs. Other EcoSSLs for zinc include 79 mg/kg, 120 mg/kg, and 160 mg/kg (USEPA 2007). The ESV of 46 mg/kg is about 5 times greater than the ESV from the next source preferred by Ohio EPA (8.5 mg/kg) (Appendix Table H-7) (DOE 1997). The ESV used for zinc is also lower than the background concentration of 61.8 mg/kg (Appendix Table H-9). These factors indicate that the Ohio EPA approved and preferred ESV for zinc is somewhat conservative; thus, the selection of zinc as a COPEC is somewhat conservative.

In summary, cadmium, lead, and mercury have alternative ESVs approved by Ohio EPA that are much less conservative than the ESVs used in this ERA. Use of these alternative ESVs would reduce the ratios of mean EPCs to ESVs and eliminate these COPECs. The zinc ESV (46 mg/kg) is lower than the background concentration (61.8 mg/kg) and the other three EcoSSLs (79, 120, 160 mg/kg). However, a zinc ESV from an alternative source (8.5 mg/kg) is lower than the preferred ESV; therefore, zinc would not be removed from further consideration as a COPEC on this basis.

Qualitative Relationship of Exposure Area to General Home Range. A majority of the highest cadmium, lead, mercury, and zinc concentrations are located near the former buildings in the cleared area (Figure 7-2 and Photograph 7-1). The highest surface soil (0-1 ft bgs) concentrations are often found in a relatively small area near the former building (Figure 7-3). These concentrations are presented below:

- Cadmium: 3.3 mg/kg at B12ss-017M-SO and 0.52 mg/kg at B12ss-018M-SO
- Lead: 86 mg/kg at B12ss-017M-SO and 69 mg/kg at B12ss-018M-SO
- Mercury: 0.10 mg/kg at B12ss-022M-SO and 0.08 mg/kg at B12ss-018M-SO
- Zinc: 180 mg/kg at B12ss-017M-SO and 170 mg/kg at B12ss-018M-SO

Regarding exposure, most of the high concentration measurements are clustered near the former buildings, not in the former settling pond. These ISM samples cover approximately 0.25 acres in size and include footprints of three former buildings (estimated areas of 530 ft^2, 117 ft^2, and 69 ft^2) and the surrounding area (Figure 7-3). This 0.25 acre area is much smaller than the usual 1-acre home range of a small bird or small mammal (USEPA 1993). A larger receptor that uses this area as a small part of its home range would, on average, be exposed to much lower concentrations of cadmium, lead,

mercury, and zinc. For example, the mean concentrations of the COPECs are 0.43 mg/kg for cadmium, 30.1 mg/kg for lead, 0.045 mg/kg for mercury, and 92 mg/kg for zinc (Table 7-14). Thus, these COPECs at their highest concentrations occur in an area of soil whose exposure to wildlife species would be relatively small and of limited consequence. This evaluation and refinement factor serves to greatly reduce concern about the four remaining integrated COPECs (cadmium, lead, mercury, and zinc).

In summary, ratios of ESV to mean concentration are relatively small for cadmium (1.2), lead (2.7), and zinc (2.0). Mercury has a ratio of 88.6. The use of alternative ESVs would lower the ratios for cadmium, lead, and mercury. For zinc, ratios would be reduced by use of alternative EcoSSLs. Most all of the highest concentrations of the four metals were found in a small 0.25 acre area near the former buildings, and this area is smaller than a general home range for small mammals and birds. Together, these factors as well as the previous factors support the view that none of these inorganic chemicals are final COPECs.

Wetland Quality, Geographical Information, and On-site Migration of Chemicals. The next three evaluation and refinement factors deal with various aspects of wetlands. The three factors are:

- Category of wetland quality inside the AOC;
- Geographical relationship of on-site wetlands to AOC exceedance area; and
- Information about on-site migration of chemicals to on-site wetlands.

If the wetland quality is low, it is distant from the high concentration area, or on-site migration is poor, it increases the likelihood that the remaining integrated COPECs (cadmium, lead, mercury, and zinc) will not be of ecological concern.

The wetland at this AOC is classified as a Category 1 wetland with an ORAM score of 23. This classification indicates impaired wetland conditions and functions (Section 7.3.2.3). The wetland was created as part of a man-made, former settling pond.

The wetland is small in size (0.39 acres). RVAAP has about 1,970 acres of wetlands, and the 0.39 acres of wetlands at the Building 1200 AOC represents about 0.01% of the total area of RVAAP wetlands (OHARNG 2008). The man-made nature of the former settling pond, low ORAM score, relatively small area, and availability of many more wetland acres at RVAAP lowers the importance of the wetland at the Building 1200 AOC.

Over a period of years, contaminants from the former buildings may have flowed into the former settling pond. Soluble contaminants are likely to be discharged via overflow. Insoluble (immobile) chemicals would be retained. The drainage ditch and former settling pond are considered an ecosystem sink for the chemicals during most seasons of the year. There is a low likelihood for off-site migration of contaminants. Evidence of this lack of movement is shown by the high concentrations of cadmium, lead, mercury, and zinc near the former buildings but not elsewhere in the AOC.

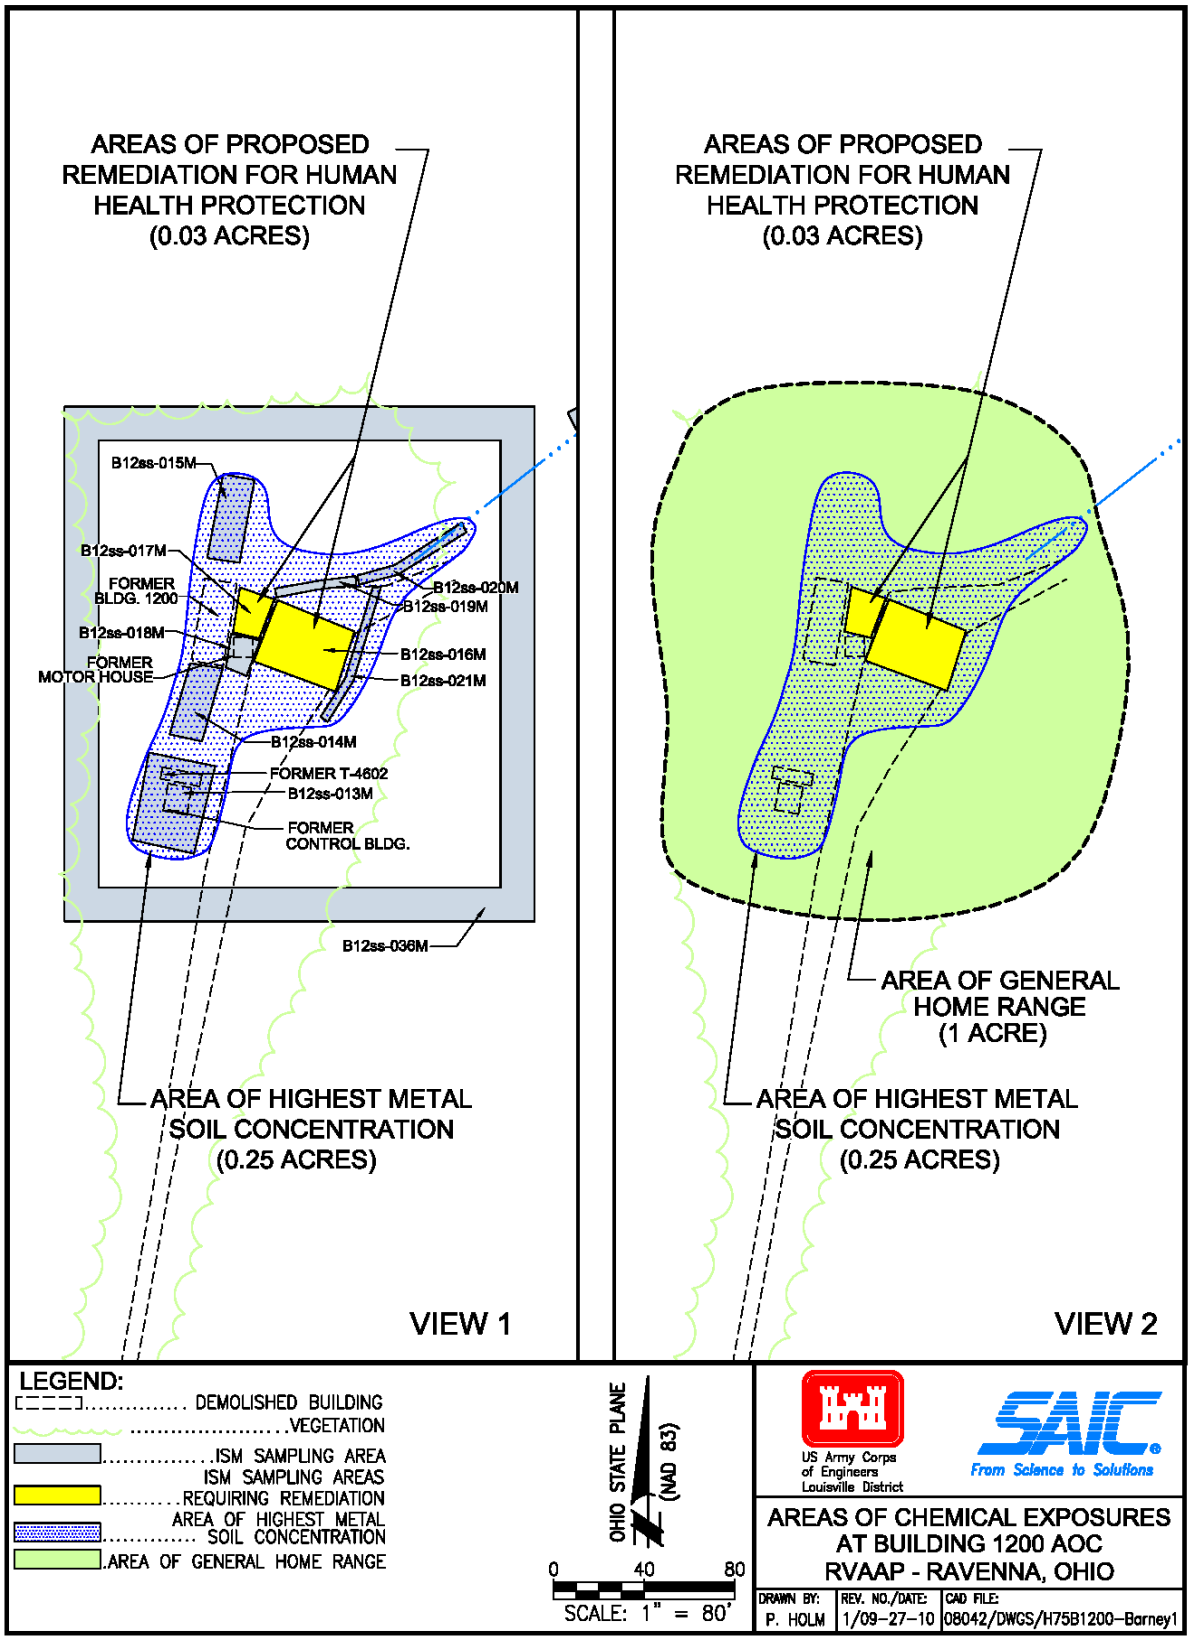

Figure 7-3. The Relationship of Areas of Highest Concentration to General Home Range
View 1 shows the areas of observed high concentrations and proposed remediation. View 2 shows these relatively small areas compared to the area of general home range.

Evaluation of Biological and Water Quality Sampling Stations. The last evaluation and refinement factor deals with the findings at the nearest biological/water quality sampling stations:

- Evaluation of off-site migration of chemicals at biological/water quality stations.

These studies were published in the *Facility-wide Biological and Water Quality Study* (USACE 2005b). These monitoring stations are positioned in streams and ponds downgradient of several AOCs. Various biological measurements of macroinvertebrates and fish, as well as chemical and physical measurements of surface water and sediment, were taken and assessed as to evidence of upgradient contamination. For the Building 1200 AOC, the nearest stream sampling station is 2,000 ft west and the nearest pond sampling station is 4,500 ft southwest (Table 7-13). There are no known connections of the Building 1200 AOC to these stream and ponds. Therefore, this particular factor cannot be applied.

Evaluation of Integrated COPECs in Sediment. The five integrated COPECs in sediment are beryllium, mercury, nitrocellulose, lindane, and acetone (Table 7-15). Beryllium and nitrocellulose were conservatively identified as integrated COPECs because the chemicals did not have an ESV. Chemicals with no ESVs are addressed in the uncertainty section (Section 7.3.3.9). Therefore, beryllium and nitrocellulose are eliminated from further consideration and will not be final COPECs. Mercury, lindane, and acetone are now discussed.

Mercury. Following the pattern of evaluation factors applied to soil, the mean concentration was compared to the sediment ESV (Appendix Table H-12). This comparison indicated mercury has a ratio below 1. Therefore, mercury is eliminated from further consideration and will not be a final COPEC.

Lindane. Lindane was detected at 0.013 mg/kg in sample B12sd-024M-SD. This was an ISM sediment sample taken from the drainage ditch connecting the former buildings to the former settling pond. This is the only detection of lindane reported for eight sediment and soil samples analyzed for pesticides. The lindane detection was in the only sediment sample taken at the Building 1200 AOC as part of the Characterization of 14 AOCs, but it was also the only detection among the 33 sediment and soil samples analyzed for pesticides during the Characterization of 14 AOCs. Sampling conducted as part of the PBA08 RI at the Building 1200 AOC had no other detections of lindane in three soil samples analyzed for pesticides. Additionally, there were no detections of lindane in the 114 sediment and soil samples analyzed for pesticides during the entirety of the PBA08 RI for all 17 AOCs. In 1996, two discrete sediment samples were collected at the AOC (USACE 1998). Sample B12SD-005(D)-0384-SD collected from the drainage ditch had a lindane concentration below the reporting limit of 0.0017 mg/kg, and sample B12SD-009(P)-0390-SD collected from the former settling pond had a lindane concentration below the reporting limit of 0.0014 mg/kg. The lindane detection in sample B12ssds-024M-SD can be considered anomalous given that 1) lindane was not detected in the drainage ditch in 1996; 2) there is no record of lindane use at the AOC after 1996; 3) lindane was infrequently detected across all AOCs at RVAAP; and 4) the one detection at the Building 1200 AOC was less than twice the reporting limit. In addition, lindane was not used in the

military processes at the AOC. Therefore, lindane is eliminated from further consideration and will not be a final COPEC.

Acetone. Acetone was detected at 0.084 mg/kg in sediment sample B12sd-024D-SD taken in 2004 during the Characterization of 14 AOCs from the drainage ditch connecting the former buildings to the former settling pond. This same drainage ditch was also sampled in 1996 [sample B12SD-005(D)-0384-SD] and acetone was not detected (<0.007 mg/kg) at that time (USACE 1998). Given that acetone was not detected in the ditch in 1996 and that the concentration detected in 2004 was low (twice the reporting limit of 0.042 mg/kg), the detection in 2004 is likely the result of laboratory contamination. Acetone is a common laboratory solvent and frequent contaminant of laboratory samples. There is no history of acetone usage at the Building 1200 AOC and, if it was used before operations ceased in the 1970s, it would not likely persist in the sediment, given that it is volatile and readily biodegradable.

In summary, all three integrated COPECs for sediment (mercury, lindane, and acetone) were eliminated from further consideration of being final COPECs.

Summary of Findings in Step 3A. Out of the 14 integrated COPECs in soil, four were eliminated because of lack of ESVs. Three integrated COPECs were eliminated from further consideration because the mean concentration is smaller than the ESV (chromium, cobalt, and copper); and three integrated COPECs were eliminated from further consideration because the mean concentration is smaller than the background concentration (aluminum, manganese, and selenium). The remaining four integrated COPECs in soil (cadmium, lead, mercury, and zinc) have a combination of factors that together eliminated them from further consideration. These factors are presented below:

1. Some mean concentration to ESV ratios of exceedance are near 1.

2. Some alternative ESVs in the Ohio EPA guidance are less conservative than the ESVs used in this ERA.
3. The highest inorganic chemical concentrations are located in an area smaller than a general home range. This is one of the most important findings in Step 3A.

4. The wetland quality is low, the wetland is distant from the high concentration area, and on-site migration is poor.

No final COPECs in soil were identified for the Building 1200 AOC.

For integrated COPECs in sediment, mercury was eliminated because the mean concentration was lower than the ESV, although it remains a PBT compound. Beryllium and nitrocellulose were eliminated due to the fact that they do not have an ESV and are addressed in the uncertainty section (Section 7.3.3.9). Lindane and acetone were eliminated from further consideration because of low concentrations, infrequency of detection, and lack of recorded use in military processes at RVAAP. No final COPECs in sediment were identified for the Building 1200 AOC.

7.3.3.8 Consideration of Human Health Driven Remediation

The Building 1200 AOC has a human health COC (manganese) identified as requiring remediation. The HHRA recommends remediation of surface soil (0-1 ft bgs) in ISM sample areas B12ss-016M and B12ss-017M. The FS recommends soil removal and disposal of an estimated 75 yd^3 over 0.03 acres. These locations requiring remediation are also where cadmium, lead, and zinc are found at their highest concentrations in surface soil (Figure 7-3). The remediated soil will be replaced with clean soil, as approved by the Ohio EPA. The clean soil used will be similar to the backfill soil used during the remedial action at Fuze and Booster Quarry Landfill/Ponds. Backfill sample results are presented in Appendix B of the *Remedial Action Report for the RVAAP-16 Fuze and Booster Quarry Landfill Ponds* (USACE 2007b).

Removal of the contaminated soil and replacement with clean soil at the Building 1200 AOC lowers the concentration to ESV ratios; and, therefore removal of the contaminated soil lowers the ecological risk (Appendix Tables H-13 and H-14). This supplements the earlier finding that the four inorganic chemicals (cadmium, lead, mercury, and zinc) can be eliminated from further consideration.

7.3.3.9 Uncertainties and Mitigations

Uncertainties or unknowns are present in both exposure data and effects data. To mitigate uncertainty in exposure data, the MDCs of all available and appropriate data were used in Level I. In Level II, the MDC and mean COPEC concentrations were used to mitigate uncertainty about exposure data for receptors at the AOC. To mitigate uncertainty in effects information, a site visit for habitat condition was conducted, and the latest INRMP of state-listed or federally-listed species sightings and planning level survey wetlands was used (OHARNG 2008). The ORAM was applied to the small wetland. Conservative ESVs, which are typically based on concentrations observed to have no effect on test species in laboratory studies, were used in Level II to mitigate uncertainty about effects on receptors at the AOC. There are some COPECs because the chemicals do not have ESVs. The COPECs are assumed to have limited toxicity given the lack of cause-effect laboratory tests and field-observed effects in the scientific literature.

As stated above, some COPECs have no ESVs. To mitigate concern for the uncertainties associated with them, other information is needed. For soil, the COPECs TNT, HMX, RDX, and nitrocellulose were identified because they do not have ESVs. Two constituents (TNT and RDX) were detected in 2 out of 13 samples. HMX was detected in 3 out of 13 samples. Thus, wildlife exposure to these three explosives would be limited. Nitrocellulose was detected in 1 out of 2 samples. Nitrocellulose is essentially non-toxic (USEPA 1987), so this chemical also is not expected to be an ecological concern. For sediment, the COPECs beryllium and nitrocellulose were identified because they had no ESVs. Beryllium was detected in 2 of 2 samples, while nitrocellulose was detected in 1 of 1 sample. The MDC (0.86 mg/kg) and mean concentration (0.81 mg/kg) for beryllium is close to its background concentration (0.38 mg/kg) and just slightly greater than its SRV (0.8 mg/kg). Because the mean concentration is essentially the same as the SRV, beryllium is not considered an ecological

concern in sediment. In addition, nitrocellulose is considered non-toxic (USEPA 1987) and is not expected to be an ecological concern in sediment.

In Level II, to mitigate uncertainty about effects on receptors at the AOC, the ESVs for COPECs are compared to background concentrations. Use of ESVs that are lower than background concentrations provides an indication of the conservative nature of the evaluation. Conservative ESVs are appropriate for use as screening thresholds in Level I and II (i.e., soil constituents with an MDC below the ESV need no further consideration in Level II).

7.3.3.10 Summary and Recommendations of Screening Level Ecological Risk Assessment

Integrated COPECs were identified in soil and sediment at the Building 1200 AOC. Many of the COPECs identified in the historical ERA were also identified during screening of PBA08 RI data. In soil, a few additional COPECs were identified due to revised, lower ESVs (Ohio EPA 2008). In sediment, all five historical COPECs were retained as integrated COPECs in the PBA08 RI. There are no integrated COPECs for surface water due to lack of aquatic habitat at the Building 1200 AOC. Those chemicals considered COPECs after screening of historical and PBA08 RI data were considered integrated COPECs.

Fourteen integrated soil COPECs and five integrated sediment COPECs were further evaluated in Step 3A with technical and refinement factors. All integrated soil and sediment COPECs were determined to be of no ecological concern. None of them required remediation or further evaluation Consequently, the ERA for the Building 1200 AOC can conclude with a Level II Screening Level ERA with the recommendation of NFA from the ecological perspective.

7.3.4 Conclusions

There is chemical contamination present in soil and sediment at the Building 1200 AOC. This contamination was identified using historical and PBA08 RI data. The American beech (*Fagus grandifolia)*, sugar maple (*Acer saccharum)*, and American tulip tree (*Liriodendron tulipifera*) forest, wetland, and small grassy habitat were observed on the 7.7 acres of the AOC. There are important and significant ecological resources at the AOC. Specifically, a wetland and a special interest area of mixed mature woods are present and near contamination. These findings invoked a requirement of a Level II assessment.

The Level II assessment evaluated soil and sediment COPECs using historical and PBA08 RI data, identified integrated COPECs, and evaluated the integrated COPECs using technical and refinement factors in Step 3A. The factors in Step 3A showed there are no integrated COPECs that are of are ecological concern requiring remediation or further evaluation. Consequently, the ERA for the Building 1200 AOC can conclude with a Level II Screening Level ERA recommending NFA from the ecological perspective.

8.0 REMEDIAL INVESTIGATION CONCLUSIONS AND RECOMMENDATIONS

8.1 INTRODUCTION

This RI for the Building 1200 AOC presents a detailed analysis of historical and newly acquired environmental data. The following sections present an overview of the major findings of the nature and extent of contamination, modeling of contaminant fate and transport, HHRA, and ERA. An updated CSM incorporating all available information is presented to integrate results of the RI. The CSM denotes, based on available data, where source areas occur, the mechanisms for contaminant migration from source areas to receptor media (e.g., surface water and groundwater), exit pathways from the AOC, and where COCs occur that may require further evaluation in a FS. This section concludes with recommendations with respect to the need for any further RI phases of work and, for each of the media evaluated in the RI, whether to proceed to the FS phase of the CERCLA process.

8.2 SUMMARY OF DATA USED IN THE REMEDIAL INVESTIGATION

Available data collected at the Building 1200 AOC represent different conditions of the AOC over approximately 14 years and were collected using discrete and ISM samples. Quality assured sample data were collected during investigations completed in 1996, 2004, and 2010. During the intervening time between the Characterization of 14 AOCs (2004) and the PBA08 RI (2010), all structures at the AOC were demolished (2005). A systematic process was used to evaluate data usability in the RI based on project DQOs, data age, and representativeness with respect to current AOC conditions and sampling methods. Table 5-2 summarizes the results of the data usability evaluation for all available Building 1200 AOC samples.

All data were incorporated into the contaminant nature and extent evaluation to identify potential temporal and longitudinal trends. All discrete and ISM surface soil data deemed representative of current conditions were incorporated into fate and transport modeling. The risk assessments incorporated surface soil and sediment ISM data representative of current AOC conditions (and associated discrete samples for VOCs). For subsurface soil, only 2010 discrete sample data were available for use in all evaluations performed in this RI. For surface water, only grab samples collected in 2004 were available for use in this RI.

8.3 SUMMARY OF NATURE AND EXTENT OF CONTAMINATION

Surface soil (0-1 ft bgs) at the Building 1200 AOC contains the majority of SRCs. The highest concentrations of inorganic SRCs, explosives, propellants, and SVOCs were detected in the vicinity of the former Building 1200 footprint. The number and concentrations of SRCs in surface soil generally decrease and become more sporadic with distance from the former Building 1200 footprint. PBA08 RI data indicate overall lower concentrations of SRCs relative to historical ISM samples taken prior to building demolition activities in 2005. Toluene was detected at one sample location at

a low, estimated concentration less than reporting limits. No pesticides or PCBs were detected or identified as SRCs in surface soil at this AOC.

Subsurface soil (boring B12sb-031) in the former settling pond contains the majority of inorganic SRCs. Explosives were not detected in any subsurface soil samples. Two SVOCs (fluoranthene and pyrene), one VOC (carbon disulfide), and one propellant (nitrocellulose) were detected only in one sample adjacent to former Building 1200 (boring B12sb-028). Pesticides and PCBs were not detected at sample location B12sb-028 (analyzed for the RVAAP full-suite analytes). Even within the thin unconsolidated overburden zone, concentrations of inorganic SRCs exhibited decreasing trends with depth.

The majority of identified SRCs in sediment samples were detected in the drainage ditch upstream of the former settling pond. The occurrence of inorganic SRCs in sediment was generally sporadic, with the exception of cadmium. Explosives were not detected in sediment samples collected from the lower reaches of the drainage ditch and within the former settling pond, indicating the extent to be primarily limited to surface soil within the former operations area and uppermost reach of the drainage ditch. Two SVOCs [benzo(b)fluoranthene and benzo(ghi)perylene], two VOCs (2-butanone and acetone), one propellant (nitrocellulose), and one pesticide (lindane) were detected in one sample in the drainage ditch (B12sd-024M). PCBs and pesticides were not detected in any subsurface soil sample. PCBs were not detected in any sediment sample.

Surface water within the drainage ditch and former settling pond is intermittent. Generally, the MDC for all SRCs occurred upgradient of the former settling pond. A decreasing longitudinal concentration trend was evident for manganese and explosive compounds. Given that these compounds were not identified as SRCs within sediment, their presence and the evident concentration trend indicates partitioning from surface soil in the former operations area and transport in soluble form during periods of rainfall or snowmelt. PCBs and pesticides were not detected in the surface water.

8.4 SUMMARY OF CONTAMINANT FATE AND TRANSPORT

Contaminant fate and transport modeling (Section 6.0) was conducted for four surface soil source areas (ISM sample areas) that have SRCs with maximum concentrations exceeding SSSLs and that have the potential to reach the water table within 1,000 years. SESOIL modeling identified four CMCOPCs (TNT, HMX, RDX, and selenium) that were predicted to exceed FWCUGs, facility-wide background concentrations, and MCL/RSL values in leachate beneath the source areas. Of these CMCOPCs, RDX (from B12ss-019M) and selenium (from B12ss-017M) were predicted to mix with the groundwater beneath the source areas at concentrations exceeding the FWCUGs, facility-wide background concentrations, and MCL/RSL values. The maximum predicted concentration of RDX in groundwater beneath the source area (0.620 mg/L) exceeds the RVAAP groundwater FWCUGs (TR of HI=0.1 or total risk of 1E-06) for the Resident Farmer Adult (0.000774 mg/L), Child (0.00111 mg/L), and the National Guard Trainee (0.00834 mg/L) receptors, as well as the MCL/RSL (0.00061 mg/L). The maximum predicted concentration of selenium in groundwater beneath the source area

(0.0913 mg/L) exceeds the MCL/RSL (0.05 mg/L). No FWCUGs exist for selenium. The predicted peak leachate concentration for RDX and selenium, assuming a constant source, is 7 and 103 years, respectively. Considering the Building 1200 AOC operations reportedly ceased in 1971, peak RDX and selenium concentrations in leachate are likely to have occurred in the past. No chemicals were predicted to migrate to the nearest downgradient groundwater receptor (tributary to the Mahoning River) at concentrations above MCLs/RSLs or FWCUGs within the 1,000-year model timeframe. Available groundwater data provide validation of modeling results. Concentrations of CMCOPCs in groundwater samples collected from monitoring wells downgradient of the at the Building 1200 AOC have been less than MCLs/RSLs and the most restrictive FWCUGs. RDX, identified as a CMCOC for groundwater beneath source area B12ss-019M, has never been detected in downgradient monitoring wells. Selenium, identified as a CMCOC for groundwater beneath source area B12ss-017M, was detected in monitoring well B12mw-010 at a concentration of 0.0047 mg/L, which was below the MCL/RSL.

8.5 SUMMARY AND CONCLUSIONS OF THE HUMAN HEALTH RISK ASSESSMENT

The HHRA was performed to identify COCs and conduct risk management evaluation to determine those COCs requiring remediation based on potential risks to human or ecological receptors. The representative human receptor for the HHRA is the National Guard Trainee based on the OHARNG projected RAFLU for the Building 1200 AOC. The risk assessment also included an evaluation of the Resident Farmer receptor to evaluate an unrestricted land use option. Media of concern at the Building 1200 AOC are surface soil, subsurface soil, surface water, and sediment.

Manganese was identified as a COC in ISM shallow surface soil (0-1 ft bgs) samples for both the National Guard Trainee and the Resident Farmer receptors. No COCs were identified in subsurface soil (1-3 ft bgs) samples. No COCs were identified in surface water or sediment samples.

8.6 SUMMARY AND CONCLUSIONS OF THE ECOLOGICAL RISK ASSESSMENT

There is chemical contamination present in soil and sediment at the Building 1200 AOC. This contamination was identified using both historical and PBA08 RI data. Various forest and other ecological resources were observed on the 7.7 acres the AOC. There are important and significant ecological resources at the AOC. Specifically, a wetland and a special interest area are present and near contamination. These findings invoked a requirement of a Level II assessment.

The Level II assessment evaluated soil and sediment COPECs. This assessment identified 14 integrated COPECs for soil (aluminum, cadmium, chromium, cobalt, copper, lead, manganese, mercury, selenium, zinc, TNT, HMX, nitrocellulose, and RDX) and 5 integrated COPECs for sediment (beryllium, mercury, nitrocellulose, lindane, and acetone). The integrated soil and sediment COPECs were further evaluated with technical and refinement factors in Step 3A. The factors in Step 3A showed that there are no integrated COPECs that are of ecological concern requiring remediation or further evaluation. Consequently, the ERA for the Building 1200 AOC concluded with a Level II Screening Level ERA recommending NFA from the ecological perspective.

8.7 UPDATED CONCEPTUAL SITE MODEL

The preliminary CSM for the Building 1200 AOC is summarized in Section 3.7. The CSM is updated in this section to incorporate results of this PBA08 RI. Elements of the CSM include:

- Primary and secondary contaminant sources and release mechanisms;
- Contaminant migration pathways and discharge or exit points;
- Potential receptors with unacceptable risk; and
- Data gaps and uncertainties.

Figure 8-1 illustrates key summary points for the revised CSM to assist in visualizing the concepts discussed below.

8.7.1 Primary and Secondary Contaminant Sources and Release Mechanisms

No primary contaminant sources (e.g., pink water discharge) remain at the Building 1200 AOC; all operations were discontinued in 1971, and any remaining infrastructure was removed in 2005. Analysis of data collected during previous investigations and the PBA08 RI identified surface soil as the principal secondary source of contamination. In particular, surface soil within the former operations area contained the majority and highest concentrations of SRCs, with manganese occurring at sufficient concentration to be considered a COC. Surface soil within the uppermost reach of the drainage ditch to the former settling pond contained RDX at a sufficient concentration to be considered a CMCOC. Sediment within the lower reaches of the drainage ditch and the former settling pond contains no explosive SRCs and comparatively fewer inorganic SRCs and SVOCs at lower concentrations than the former operations area. The available data indicate sediment within the lower drainage ditch and former settling pond is not a substantial secondary source of contamination.

The primary mechanisms for releases of contaminants from secondary sources at the Building 1200 AOC include the following:

- Erosion of soil matrices with sorbed contaminants and mobilization in turbulent surface water flow under storm conditions;
- Dissolution of soluble contaminants and transport in surface water; and
- Contaminant leaching to groundwater.

Available data show contaminant dissolution processes and transport from the former operations area are active due to the presence of SRCs in surface water samples. Sediment samples along the drainage and former settling pond system indicate minimal transport and re-deposition of

contaminants sorbed onto eroded soil matrices. Fate and transport modeling indicates minimal leaching potential from surface soil in the former operations area to groundwater; no contaminants are predicted to exceed the most restrictive FWCUGs for groundwater exposures.

8.7.2 Contaminant Migration Pathways and Exit Points

8.7.2.1 Surface Water Pathways

Migration of contaminants from soil sources via surface water occurs primarily by: (1) movement of the particle-bound contaminants in surface water runoff; and (2) transport of dissolved constituents in surface water. Upon reaching portions of surface water conveyances where flow velocities decrease and particle-bound contaminants largely settle out as sediment accumulation, sediment-bound contaminants may become re-suspended and migrate during storm events, or may partition to a dissolved phase in surface water. The primary migration pathway for surface water at the Building 1200 AOC is the drainage system and former settling pond.

Deposition of particle-bound contaminants appears to occur within the uppermost reaches of the drainage ditch to the former settling pond. Flow velocities within the drainage ditch are likely low due to the gentle topography of the area, heavy vegetation cover, and small catchment area, which allows sorbed contaminants to settle out quickly within the upper reaches of the ditch. Dissolved phase contaminants in surface water migrate further along the drainage system as evidenced by the presence of SRCs, especially explosives in surface water samples. Surface water exits the former settling pond to the southeast, diffuses into a wooded area along the former discharge area, and infiltrates into the soil.

8.7.2.2 Groundwater Pathways

Groundwater at the Building 1200 AOC generally flows from southwest to northeast within sandstone/shale bedrock at a gentle, consistent gradient ranging from 0.018 to 0.026 ft/ft, based on historical data. Soil cover is generally less than 3 ft thick. Silty clays and silty sands dominate in the overburden. Contaminant leaching pathways from soil to the water table are through the soil cover and bedrock interval. The unsaturated zone thickness ranges from 12-20 ft.

Fate and transport modeling results indicate that only RDX may leach from surface soil in the former operations area and migrate to groundwater below the source at concentrations above MCLs/RSLs and FWCUGs for the National Guard Trainee and Resident Farmer Adult and Child receptors. However, RDX has not been detected in groundwater monitoring wells immediately downgradient of the Building 1200 AOC since the inception of monitoring in 2004. Hydrogeologic conditions indicate a low degree of groundwater-surface water interaction, which limits infiltration to the uppermost groundwater zones. Thus, groundwater transport does not appear to be a major mechanism for contaminant transport off the AOC. The nearest downgradient groundwater receptor lies 4,100 ft to the northeast (tributary to Eagle Creek), and no contaminants are predicted to reach this receptor at concentrations above MCLs/RSLs or FWCUGs.

8.7.3 Potential Receptors

As identified in the HHRA, the National Guard Trainee is a representative receptor under the RAFLU. This receptor, under a dismounted training with some digging land use scenario, is assumed to be exposed to soil from 0 to 4 ft bgs and 4-7 ft bgs, surface water, and sediment. Shallow bedrock at the AOC precludes exposure to soil below a depth of about 3 ft bgs. Manganese was identified as a COC within surface soil (0-1 ft bgs) for this land use scenario. Figure 8-1 illustrates those portions of the Building 1200 AOC that exceed the National Guard Trainee FWCUG for manganese in surface soil. Manganese was also identified as a COC in surface soil for a Resident Farmer receptor in the same locations. No COCs were identified for subsurface soil below 1 ft bgs, surface water, or sediment.

Ecological receptors at the Building 1200 AOC are potentially exposed to contaminants in soil, sediment, and intermittent surface water within the drainage ditch and former settling pond wetland. Permanent, viable aquatic habitat is not present on the AOC, which precludes exposures to aquatic organisms. Groundwater is not considered an exposure medium for ecological receptors on the AOC given its depth and occurrence with bedrock, and there are no discharge points (e.g., springs, seeps) that would represent a potential exposure point.

8.7.4 Uncertainties

Uncertainties are inherent in the CSM depending on density and availability of data. The CSM for the Building 1200 AOC is overall well defined using existing data, and major data gaps do not remain to be resolved. However, some uncertainties for the CSM for the Building 1200 AOC include the following:

- Surface water characterization on the AOC is subject to some uncertainty due to the intermittent occurrence of standing water. However, the available data do not suggest high contaminant fluxes exiting the Building 1200 AOC, and no COCs were identified from previously collected samples. Removal of primary contaminants sources (e.g., buildings), grading, and re-vegetation of those areas in 2005 likely have resulted in a lower overall degree of soil erosion and contaminant migration from the former operations area.

- The existing groundwater monitoring well network at the AOC indicates groundwater flow is consistently to the northeast toward a tributary to Eagle Creek. Some uncertainty exists with respect to groundwater flow directions and gradient beyond the immediate vicinity of the Building 1200 AOC due to the limited number of monitoring wells in the area. Further evaluation of groundwater at the AOC will be performed in a separate report for groundwater.

8.8 RECOMMENDATION OF THE REMEDIAL INVESTIGATION

Based on the PBA08 RI results, the Building 1200 AOC has been adequately characterized and the recommended path forward is to proceed to an FS. The FS will evaluate remedial alternatives to

address manganese contamination in shallow surface soil at ISM sampling areas B12ss-016M and B12ss-017M. The COCs identified for each potential exposure medium and land use receptor are summarized in Table 8-1, along with recommended CUGs based on the most likely foreseeable future land use.

Table 8-1. Chemicals of Concern and Recommended Cleanup Goals

Media	Chemical of Concern	Cleanup Goal (mg/kg)	Location Requiring Remediation (COC Concentration)
National Guard Training Land Use			
Shallow Surface Soil (0-1 ft bgs)	Manganese	1,800	B12ss-016M (4,100 mg/kg)
			B12ss-017M (2,700 mg/kg)
Residential Land Use			
Shallow Surface Soil (0-1 ft bgs)	Manganese	2,927	B12ss-016M (4,100 mg/kg)
			B12ss-017M (2,700 mg/kg)

Cleanup goal (CUG) for unrestricted land use is the lower of the Facility-Wide Cleanup Goals (FWCUGs) for the National Guard Trainee Land Use and the Residential Land Use.
bgs = below ground surface
COC = Chemical of Concern

Analyses of remedial alternatives are not warranted for subsurface soil greater than 1 ft bgs, sediment, or surface water based on the absence of human health COCs and results of ERA. NFA is recommended for these media. Soil remediation to protect groundwater resources is also not warranted based on contaminant leaching and fate and transport modeling results.

THIS PAGE INTENTIONALLY LEFT BLANK.

9.0 REMEDIAL ACTION OBJECTIVES, CLEANUP GOALS, AND VOLUME CALCULATIONS

This section presents the RAO, appropriate CUGs for remedial actions, and volume estimates of media requiring remediation to attain specific land use scenarios. The RAO is in accordance with the NCP and CERCLA RI/FS guidance, specifying receptors, exposure routes, and desired exposure levels. CUGs establish acceptable exposure levels protective of human health and the environment and consider potential land uses. The CUGs also provide the basis for screening, evaluating, and selecting a remedial alternative. This section also presents the estimated volume of soil exceeding the respective CUGs. The volume estimates present the estimated quantity and location of media requiring remediation to attain a specific land use scenario.

9.1 REASONABLE AND ANTICIPATED FUTURE LAND USE

The Reasonable and Anticipated Future Land Use (RAFLU) for the Building 1200 AOC is National Guard Training with digging. Consequently, the representative receptor at this AOC is the National Guard Trainee. The RAFLU and the selection of the representative receptor are discussed in more detail in Section 7.2.3.

Residential Land Use is not anticipated at RVAAP or this AOC; however, an unrestricted land use scenario is developed and evaluated. Remediation to achieve CUGs protective of the Resident Farmer is protective of all potential RVAAP receptors as established in the FWCUG Report (USACE 2010a), with the exception of certain chemicals for the National Guard Trainee. For the purposes of this RI/FS report, a combination of the most restrictive CUGs established for the National Guard Trainee and Resident Farmer provides the requisite level of protectiveness for unrestricted land use.

9.2 REMEDIAL ACTION OBJECTIVE

The RAO for the Building 1200 AOC is to prevent: (1) National Guard Trainee exposure to COCs above CUGs in soil, sediment, and surface water; (2) adverse ecological effects from previous AOC activities; and (3) negative groundwater impacts from contaminant migration from source media (e.g., soil and sediment).

Conclusions of the ERA (Section 7.3.4) indicate remedial actions are not warranted to specifically protect ecological receptors. Fate and transport modeling (Section 6.0) indicates soil and sediment remediation to protect groundwater are not warranted. Remedial actions specific to groundwater media at the Building 1200 AOC will be evaluated in a separate report. It is noted that anticipated remedial activities to protect the human receptor will benefit ecological resources and reduce the potential for contaminant migration to groundwater.

9.3 REMEDIAL ACTION CLEANUP GOALS

Based on an evaluation of ISM sample results and EPCs calculated from discrete samples, the HHRA recommends CUGs to support the remedial alternative selection process for remediation. Table 9-1 lists the media, COCs, and CUGs associated with achieving the National Guard Training and Residential Land Uses. Manganese in shallow surface soil is a COC for both land use scenarios. Remediation of manganese in shallow surface soil to the CUG of 1,800 mg/kg will attain the RAO for the National Guard Training Land Use as well as for Residential Land Use.

Table 9-1. Cleanup Goals for National Guard Training and Residential Land Use

Media	Chemical of Concern	Cleanup Goal (mg/kg)
Shallow Surface Soil (0-1 ft bgs)	Manganese	1,800
Deep Surface Soil (1-4 ft bgs)	None	None
Subsurface Soil (1-13 ft bgs)	None	None
Sediment	None	None
Surface Water	None	None

bgs = below ground surface
mg/kg = milligram per kilogram

9.4 VOLUME CALCULATIONS OF MEDIA REQUIRING REMEDIATION

Tables 9-2 and 9-3 provide the basis for volume estimations for areas requiring remediation. Figure 9-1 shows areas requiring remediation for the National Guard Training and Residential Land Uses.

Table 9-2. Estimated In Situ Soil Volume Requiring Remediation

ISM Sample Location	Media	Manganese Concentration	Surface Area (ft^2)	Treatment Interval (ft bgs)	In Situ Volume (ft^3)
National Guard Training and Residential Land Use					
B12ss-016M	Surface Soil	4,100 mg/kg	1,074	0-1	1,074
B12ss-017M	Surface Soil	2,700 mg/kg	268	0-1	268
				Total In Situ Volume	1,342

bgs = below ground surface
ISM = incremental sample methodology

Table 9-3. Estimated Volumes of Soil Requiring Remediation

Land Use Scenario and Media	In situ		In situ with Constructability[1]		Ex situ[1,2]	
	Volume (ft^3)	Volume (yd^3)	Volume (ft^3)	Volume (yd^3)	Volume (ft^3)	Volume (yd^3)
National Guard Training and Residential Land Uses ~ Surface Soil	1,342	50	1,678	62	2,013	75

[1] Constructability accounts for over excavation, sloping of sidewalls, and addresses limitations of removal equipment. The in situ volume is increased by 25% for a constructability factor.

[2] Includes 20% swell factor

10.0 APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

10.1 INTRODUCTION

CERCLA Section 121 specifies remedial actions must comply with requirements or standards under federal or more stringent state environmental laws that are "applicable or relevant and appropriate to the hazardous substances or particular circumstances at the AOC." Inherent in the interpretation of ARARs is the assumption that protection of human health and the environment is ensured. This section summarizes potential federal and state chemical-, location-, and action-specific ARARs for the potential remedial actions at the AOC.

ARARs include those federal and state regulations that are designed to protect the environment. Applicable requirements are "those cleanup standards, standards of control, and other substantive environmental protection requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting law that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance at a CERCLA site" [40 Code of Federal Regulations (CFR) 300.5]. USEPA has stated in the NCP that applicable requirements are those requirements that would apply if the response action were not taken under CERCLA.

Relevant and appropriate requirements are "those cleanup standards, standards of control, and other substantive environmental protection requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting law that, while not applicable to a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance at a CERCLA site, address problems or situations sufficiently similar to those encountered at the CERCLA site such that their use is well suited to the particular site" (40 CFR 300.5).

In the absence of federal or state-promulgated regulations, there are many criteria, advisories, guidance values, and proposed standards that are not legally binding, but may serve as useful guidance for setting protective cleanup levels. These are not potential ARARs but are to-be-considered guidance [40 CFR 300.400(g)(13)].

CERCLA remedial response actions at an AOC must comply only with the substantive requirements of a regulation [CERCLA Section 121(e)]. Substantive requirements are those that pertain directly to the actions or conditions at an AOC, while administrative requirements facilitate their implementation. USEPA recognizes that certain administrative requirements (e.g., consultation with state agencies, reporting) are accomplished through state involvement and public participation. These administrative requirements should also be observed if they are useful in determining cleanup standards at the AOC (55 CFR 8757).

Although remedial actions for AOCs at National Priorities List (NPL) sites must comply only with the substantive requirements of federal or state environmental regulations, the Ohio Revised Code does not provide a similar permit waiver for actions conducted under the Ohio EPA Remedial Response Program Policy. The Ohio EPA's Division of Emergency and Remedial Response (DERR) Policy DERR-00-RR-034 states, "it has been DERR's policy to require responsible parties to acquire and comply with all necessary permits, including the substantive and administrative requirements." However, a DFFO was entered into on June 10, 2004, that provided certain exemptions from the Ohio Administrative Code (OAC) administrative requirements and required groundwater monitoring and remediation at RVAAP to be performed under the CERCLA process. The DFFO includes provisions for compliance resulting in the potential negation of all provided exemptions within the DFFO in the event non-compliant activities are identified.

10.2 POTENTIAL ARARS

USEPA classifies ARARs as chemical-specific, action-specific, and location-specific to provide guidance for identifying and complying with ARARs (USEPA 1988a):

- Chemical-specific ARARs are health- or risk-based numerical values or methodologies which, when applied to site-specific conditions, allow numerical values to be established. These values establish the acceptable amount or concentration of a chemical that may be found in, or discharged to, the ambient environment (USEPA 1988a).

- Action-specific ARARs are rules, such as performance or design or other activity-based rules, which place requirements or limitations on actions.

- Location-specific ARARs are rules that place restrictions on the concentration of hazardous substances or the conduct of activities solely because they occur in special locations (USEPA 1988a).

As explained in the following paragraph, rules from each of these categories are ARARs only to the extent that they relate to the degree of cleanup.

CERCLA Section 121 governs cleanup standards at CERCLA sites. ARARs originate in CERCLA Section 121(d), which specifies the degree of cleanup at each AOC, CERCLA Section 121(d). In Section 121(d)(2), CERCLA expressly directs that ARARs are to address specific contaminants of concern at each AOC, specifying the level of protection to be attained by any chemicals remaining at the AOC. CERCLA Section 121(d)(2) provides that with respect to hazardous substances, pollutants, or contaminants remaining on-site at the completion of a remedial action, an ARAR is:

> "any standard, requirement, criteria, or limitation under any Federal environmental law … or any promulgated standard, requirement, criteria, or limitation under a State environmental or facility siting law that is more stringent than any Federal standard, requirement, criteria, or limitation."

CERCLA Section 121(d)(2) further provides that the remedial action attains a level of control established in rules determined to be ARARs.

Action- or location-specific requirements will be ARARs to the extent that they establish standards addressing COCs that will remain at the AOC. In addition, CERCLA Section 121(d)(1) directs that remedial actions taken to achieve a degree of cleanup that is protective of human health and the environment are to be relevant and appropriate under the circumstances presented by the release. Accordingly, any chemical-, action-, or location-specific requirements will be ARARs to the extent that they ensure the degree of cleanup will be protective of human health and the environment under the circumstances presented by the release.

In summary, chemical-, action-, or location-specific requirements will be ARARs to the extent that they establish standards protective of human health and the environment for chemicals that will remain on-site after the remedial action, and to the extent that they ensure a degree of cleanup that is protective of human health and the environment under the circumstances presented by the release.

10.2.1 Potential Chemical-Specific ARARs

The environmental medium evaluated in this FS is soil. COCs were identified in soil for receptors representing an unrestricted land use scenario. A review of the regulations indicates there are no potential chemical-specific ARARs for any of the contemplated alternatives due to the medium and chemicals of concern. The AOC does not include areas such as surface water bodies that would potentially trigger such potential ARARs as Ambient Water Quality Criteria (AWQC) or MCL, as groundwater is not a medium of concern. Although a small wetland is present within the area, there is no identifiable surface water, and as such AWQCs have not been included within the identified ARARs for the AOC.

Additionally, a review of the regulations did not identify any potential chemical-specific ARARs for soil that would be triggered and would require special consideration or remedial action. No regulations were identified that included specific chemical concentrations or requirements that would be a potential ARAR to drive the remedial action process.

10.2.2 Potential Action-Specific ARARs

Under the No Action alternative, no activities would be conducted at the AOC; therefore, no action-specific ARARs are identified for this alternative.

Alternative 2 consists of excavation and disposal of contaminated environmental media at the AOC. Implementation of this alternative triggers potential ARARs associated with land disturbance and emission controls. Table 10-1 presents potential action-specific ARARs under this alternative. The OAC 3745-15-07 requires that nuisance air pollution emissions be controlled. This includes the control of potential fugitive dust from soil handling excavation activities. In addition, any construction (e.g., soil disturbance activities over 1 acre in size) would trigger the storm water

requirements found at 40 CFR Part 450. These requirements mandate that erosion and sedimentation control measures be designed and implemented to control erosion and sediment run-off.

Because this alternative includes the generation and management of contaminated media, the requirements of RCRA would be considered potential ARARs for this alternative. The RCRA requirements mandate that a generator must determine whether a material is (or contains in the case of environmental media) a hazardous waste under OAC 3745-52-11. If a material is determined to be or contain a listed hazardous waste, or exhibits a hazardous waste characteristic, additional management requirements under RCRA must follow an ARAR under CERCLA.

These requirements include the manner in which hazardous waste is stored, treated, transported, and disposed. These RCRA requirements are generally not considered to be chemical-specific ARARs because they do not relate directly to the degree of cleanup, or to specific chemicals. In addition to the substantive requirements associated with the management and storage of material that is also RCRA hazardous waste (or found to contain such a waste), some RCRA requirements prescribe standards for disposal of hazardous material. These include: (1) land disposal restrictions (LDRs) prohibiting disposal of specific chemicals until they are treated to a specified level, or by a specific treatment technology; and (2) minimum technical requirements (MTRs) for land disposal units.

USEPA cautions that LDRs should not be used to determine site-specific cleanup levels for soil (USEPA 2002). The purpose of LDRs is to require appropriate treatment of RCRA hazardous waste that is to be land disposed of to minimize short and long-term threats to human health or the environment based upon available technology. Performing treatment to meet LDR standards is different from the CERCLA approach to remediation, which is analyzing risk and then developing soil cleanup standards based on the risk present, and may result in soil cleanup levels that are different from those of a risk-based approach. Nevertheless, if RCRA hazardous waste is generated from the CERCLA action and are land disposed of on-site, the material must meet the standards established in the LDRs.

In order for LDRs to be triggered as potential ARARs, RCRA hazardous waste must be present. This requires: (1) that soil contains contaminants that either derive from RCRA-listed waste, or that exhibits a characteristic of RCRA hazardous waste; and (2) that soil is managed in a way that "generates" hazardous waste. Several methods of soil management that do not "generate" hazardous waste and so do not trigger LDRs are available for use. These methods include the AOC approach, use of a staging pile, use of a storage or treatment corrective action management unit (CAMU), or use of a temporary unit (TU).

If soil is managed in a manner that generates hazardous waste, such as removing it to an above-ground container and then re-depositing the soil within the land unit for disposal, then LDRs become potential ARARs. LDRs attach to the waste at the time it is removed from the unit under an AOC approach, or at the time the soil is excavated from the unit. Potential LDR ARARs in Ohio are variances from treatment standards in OAC Section 3745-700-44, LDR standards for contaminated

debris in OAC Section 3745-47, Universal Treatment Standards (UTS) in OAC Section 3745-270-48, and Alternative Standards for Contaminated Soil in OAC Section 3745-270-49.

Ohio has adopted the alternative soil treatment standards as promulgated by USEPA in its Phase IV LDR rule, effective August 1998. The rules provide that if RCRA hazardous waste is present, the material must meet one of two sets of LDRs before being disposed of in a land unit: (1) the UTS; or (2) the contaminated soil (technology-based treatment) standards promulgated in Phase IV of the LDRs, whichever is greater. Or, if a generator so chooses, he may use the generic treatment standards in OAC Section 3745-270-40 which apply to all hazardous waste. Only the alternative soil treatment standards are explained in this document. Under the alternative soil treatment standards, all soil subject to treatment must be treated as follows:

1. For non-metals, treatment must achieve 90% reduction in total constituent concentration [primary constituent for which the waste is characteristically hazardous as well as for any organic or inorganic underlying hazardous constituent (UHC)], subject to item 3 below.

2. For inorganic chemicals and carbon disulfide, cyclohexanone, and methanol, treatment must achieve 90% reduction in constituent concentrations as measured in leachate from the treated media [tested according to the Toxicity Characteristic Leaching Procedure (TCLP)] or 90% reduction in total constituent concentrations (when a metal removal treatment technology is used), subject to item 3 below.

3. When treatment of any constituent subject to treatment to a 90% reduction standard would result in a concentration less than 10 times the UTS for that constituent, treatment to achieve constituent concentrations less than 10 times the UTS is not required. This is commonly referred to as "90% capped by 10xUTS."

4. USEPA and Ohio EPA have established a site-specific variance from the soil treatment standards, which can be used when treatment to concentrations of hazardous constituents greater (i.e., higher) than those specified in the soil treatment standards minimizes short- and long-term threats to human health and the environment. In this way, on a case-by-case basis, risk-based LDR treatment standards approved through a variance process could supersede the soil treatment standards. Any variance granted cannot rely on capping, containment, or other physical or institutional controls.

If CAMUs are used as disposal units at the AOC, the design and treatment standards established at OAC Section 3745-57-72 will be potentially relevant and appropriate to the response action. Only CAMU-eligible waste can be disposed of in a CAMU. CAMU-eligible waste includes hazardous and non-hazardous waste that are managed for implementing cleanup, depending on the Director's approval or prohibition of specific waste or waste streams. Use of a CAMU for disposal does not trigger LDRs or MTRs as long as the standards specified in the rule are observed. The Director will incorporate design and treatment standards into a permit or order. Design standards include a composite liner and a leachate collection system designed and constructed to maintain less than a 30

cm depth of leachate over the liner. A composite liner entails a system consisting of two components; each component has detailed specifications and installation requirements. The Director may approve alternate requirements if he can make the findings specified in the rule. Treatment standards are similar to LDR standards for contaminated soil, although alternative and adjusted standards may be approved or required by the Director, as long as the adjusted standard is protective of human health and the environment.

Table 10-1. Potential Action-Specific ARARs

Media and Citation	Description of Requirement	Potential ARAR Status	Standard
Prohibition of air pollution nuisances (e.g., fugitive dust) OAC Section 3745-15-07	These rules prohibit a release of nuisance air pollution that endangers health, safety, or welfare of the public or causes personal injury or property damage.	Applies to any activity that could result in the release of a nuisance air pollutant. This would include dust from excavation or soil management processes.	Any person undertaking an activity is prohibited from emitting nuisance air pollution.
Storm water requirements at construction sites 40 CFR Part 450	These rules require that storm water controls be employed at construction sites that exceed 1 acre in size.	Applies to any construction activity that exceeds 1 acre in total size.	Persons undertaking construction activities (including grubbing and land clearing) at an AOC where the construction footprint is over 1 acre in size must design and implement erosion and run-off controls.
Generation of contaminated soil or debris OAC Section 3745-52-11	These rules require that a generator determines whether a material generated is a hazardous waste.	Applies to any material that is or contains a solid waste. Must be characterized to determine whether the material is or contains a hazardous waste.	Any person that generates a waste as defined must use prescribed methods to determine if waste is considered characteristically hazardous.
Management of contaminated soil or debris that is or contains a hazardous waste OAC Sections 3745-52-30 through -34	These rules require that hazardous waste be properly packaged, labeled, marked, and accumulated on-site pending on-site or off-site disposal.	Applies to any hazardous waste or media containing a hazardous waste that is generated from on-site activities.	All hazardous waste must be accumulated in a compliant manner that includes proper marking, labeling, and packaging of such waste in accordance with the specified regulations. This includes inspection of containers or container areas where hazardous waste is accumulated on-site.
Acquisition and use of manifests for hazardous waste shipments to off-site treatment, storage, or disposal facilities OAC Sections 3745-52-20 through -23	These rules require that a Uniform Hazardous Waste Manifest be used for any off-site shipment of hazardous waste.	Applies to any shipment of hazardous waste to an off-site facility for treatment, storage, or disposal.	Requires a generator who transports or offers for transportation hazardous waste for off-site treatment, storage, or disposal to prepare a uniform hazardous waste manifest.

Table 10-1. Potential Action-Specific ARARs (continued)

Media and Citation	Description of Requirement	Potential ARAR Status	Standard
Soil contaminated with RCRA hazardous waste OAC Section 3745-400-49 OAC Section 3745-400-48 UTS	These rules prohibit land disposal of RCRA hazardous waste subject to them unless the waste is treated to meet certain standards that are protective of human health and the environment. Standards for treatment of hazardous waste-contaminated soil prior to disposal are set forth in the two cited rules. Use of the greater of either technology-based standards or UTS is prescribed.	LDRs apply only to RCRA hazardous waste. This rule is considered for ARAR status only upon generation of a RCRA hazardous waste. If any soil is determined to be RCRA hazardous, and if they will be disposed of on-site, this rule is potentially applicable to disposal of the soil.	All soil subject to treatment must be treated as follows: 1) For non-metals, treatment must achieve 90% reduction in total constituent concentration (primary constituent for which the waste is characteristically hazardous as well as for any organic or inorganic UHC), subject to 3 below. 2) For metals and carbon disulfide, cyclohexanone, and methanol, treatment must achieve 90% reduction in constituent concentrations as measured in leachate from the treated media (tested according to the TCLP) or 90% reduction in total constituent concentrations (when a metal removal treatment technology is used), subject to 3 below. 3) When treatment of any constituent subject to treatment to a 90% reduction standard would result in a concentration less than 10 times the UTS for that constituent, treatment to achieve constituent concentrations less than 10 times the UTS is not required. This is commonly referred to as "90% capped by 10xUTS."
Soil contaminated with RCRA hazardous waste OAC Section 3745-400-49 OAC Section 3745-400-48 UTS	These rules prohibit land disposal of RCRA hazardous waste subject to them unless the waste is treated to meet certain standards that are protective of human health and the environment. Standards for treatment of hazardous contaminated soil prior to disposal are set forth in the two cited rules. Use of the greater of either technology-based standards or UTS is prescribed.	LDRs apply only to RCRA hazardous waste. This rule is considered for ARAR status only upon generation of a RCRA hazardous waste. If any soil is determined to be RCRA hazardous, and if they will be disposed of on-site, this rule is potentially applicable to disposal of the soil.	All soil subject to treatment must be treated as follows: 1) For non-metals, treatment must achieve 90% reduction in total constituent concentration (primary constituent for which the waste is characteristically hazardous as well as for any organic or inorganic UHC), subject to 3 below. 2) For metals and carbon disulfide, cyclohexanone, and methanol, treatment must achieve 90% reduction in constituent concentrations as measured in leachate from the treated media (tested according to the TCLP), or 90% reduction in total constituent concentrations (when a metal removal treatment technology is used), subject to 3 below. 3) When treatment of any constituent subject to treatment to a 90% reduction standard would result in a concentration less than 10 times the UTS for that constituent, treatment to achieve constituent concentrations less than 10 times the UTS is not required. This is commonly referred to as "90% capped by 10xUTS."

Table 10-1. Potential Action-Specific ARARs (continued)

Media and Citation	Description of Requirement	Potential ARAR Status	Standard
Debris Contaminated with RCRA Hazardous Waste OAC Section 3745-400-49 OAC Section 3745-400-47	These rules prescribe conditions and standards for land disposal of debris contaminated with RCRA hazardous waste. Debris subject to this requirement for characteristic RCRA contamination that no longer exhibits the hazardous characteristic after treatment does not need to be disposed of as a hazardous waste. Debris contaminated with listed RCRA contamination remains subject to hazardous waste disposal requirements.	If RCRA hazardous debris is disposed of on-site, these rules are potentially applicable to disposal of the debris.	Standards are extraction or destruction methods prescribed in OAC Section 3745-400-47. Treatment residues continue to be subject to RCRA hazardous waste requirements.
Soil/Debris Contaminated with RCRA Hazardous Waste – Variance OAC Section 3745-400-44	The Director will recognize a variance approved by the USEPA from the alternative treatment standards for hazardous contaminated soil or for hazardous debris.	Potentially applicable to RCRA hazardous soil or debris that is generated and placed back into a unit and that will be land disposed of on-site.	A site-specific variance from the soil treatment standards can be used when treatment to concentrations of hazardous constituents greater (i.e., higher) than those specified in the soil treatment standards minimizes short- and long-term threats to human health and the environment. In this way, on a case-by-case basis, risk-based LDR treatment standards approved through a variance process could supersede the soil treatment standards.

AOC = Area of Concern
ARAR = Applicable or Relevant and Appropriate Requirements
CAMU = Corrective Action Management Unit
CFR = Code of Federal Regulations
LDR = Land Disposal Restrictions
MTR = Minimum Technical Requirements
OAC = Ohio Administrative Code
RCRA = Resource Conservation and Recovery Act
TCLP = Toxicity characteristic leaching procedure
UHC = Underlying Hazardous Constituent
USEPA = U.S. Environmental Protection Agency
UTS = Universal Treatment Standard

.

10.2.3 Potential Location-Specific ARARs

Potential location-specific ARARs are presented in Table 10-2. Location requirements include those established for potential remedial activities conducted within wetlands, within a floodplain area, or with respect to threatened and endangered species. Generally, for wetlands and floodplains, rules require alternatives to remedial activity within the sensitive area be pursued; if that is not feasible, adverse effects from any actions taken within the sensitive area must be mitigated to the extent possible. These requirements do not relate to specific chemicals nor do they further change the degree of cleanup in the sense of protecting human health or the environment from the effects of harmful substances. Rather, their purpose is to protect the sensitive areas to the extent possible. Under CERCLA Section 121(d), relevance and appropriateness are related to the circumstances presented by the release of hazardous substances, with the goal of attaining a degree of cleanup and control of further releases that ensures protection of human health and the environment.

Rules ensuring protection of sensitive resources do not represent requirements that are relevant and appropriate to circumstances presented by the release of hazardous substance, with a goal of attaining a degree of cleanup and control of further releases that ensure protection of human health and the environment. Location requirements for wetlands and floodplains do not relate to the degree of cleanup as much as they relate to protection of these sensitive areas from effects of remedial activities. Source removal has the potential of impacting wetlands within the area which would result in the requirements of 40 CFR Part 1022 being considered as a potential ARAR. Note that for these requirements to be considered an ARAR, actual delineated wetlands would have to be impacted or potentially impacted due to remedial actions taken under the selected alternative.

The Endangered Species Act (ESA) exists to protect the habitat or body of flora and fauna that are threatened or endangered. Once again, these rules do not relate to specific chemicals, nor do they further the degree of cleanup in the sense of protecting human health or the environment from the effects of harmful substances. The purpose of these rules is to protect sensitive areas and plant and animal life to the degree possible. This purpose does not address problems or situations sufficiently similar to those encountered at the CERCLA site that its use is well suited to the particular AOC as an ARAR; that is, the rule requirements are not sufficiently relevant and appropriate under CERCLA Section 121(d) as related to the circumstances of the release, degree of cleanup, or protectiveness of the remedial action to include these requirements as ARARs.

Having determined that these requirements are not ARARs, any action taken by the Federal Government must be conducted in accordance with requirements established under the National Environmental Policy Act (NEPA), ESA, National Historic Preservation Act, and federal and state wetlands and floodplains construction and placement of material considerations, even though these laws and rules do not establish standards, requirements, limitations, or criteria relating to the degree of cleanup for chemicals remaining on-site at the close of the response actions.

Table 10-2. Potential Location-Specific ARARs

Media and Citation	Description of Requirement	Potential ARAR Status	Standard
Presence of wetlands as defined in 10 CFR 1022.4(v).	Establishes the requirements to evaluate any action taken within a wetland to ensure that impacts are minimized or averted as required in 10 CFR 1022.3 (a) – (d).	Potentially applicable for activities that result in the impact of a wetland as defined.	Avoid to the extent possible the long- and short-term adverse effects associated with destruction, occupancy, and modification of wetlands. Measures to mitigate adverse effects of actions in a wetland include, but are not limited to, minimum grading requirements, runoff controls, design and construction constraints, and protection of ecologically-sensitive areas in 10 CFR 1022.12(a)(3). Take action to the extent practicable to minimize destruction, loss, or degradation of wetlands and to preserve, restore, and enhance the nature and beneficial value of wetlands. Potential effects of any new construction in wetlands that are not in a floodplain shall be evaluated to identify and, as appropriate, implement alternative actions that may avoid or mitigate adverse impacts on wetlands.

ARAR = Applicable or Relevant and Appropriate Requirements.
CFR = Code of Federal Regulations

THIS PAGE INTENTIONALLY LEFT BLANK.

11.0 TECHNOLOGY TYPES AND PROCESS OPTIONS

This section identifies and describes the GRAs which may be implemented to achieve the remedial goals. In addition, this section summarizes the remedial technologies and process options available to remediate COCs in media identified in Section 9.0 of this report.

The procedure for identifying and screening potential remedial technologies followed the method established in the USEPA guidance document, *Guidance for Conducting Remedial Investigation/Feasibility Studies under CERCLA* (USEPA 1988a). This guidance document provides the framework for identifying and screening all available remedial technologies to the most appropriate technologies available based on the COCs and AOC characteristics (e.g., soil type).

11.1 GENERAL RESPONSE ACTION

GRAs are actions which may be implemented to satisfy the RAOs. The actions may be individual or a combination of responses. As soil is the only media requiring remediation at this AOC, the following GRAs are applicable and are defined in greater detail in subsequent sections:

- No Action;
- Land use controls (LUCs)/five-year reviews;
- Removal;
- Treatment; and
- Disposal/handling.

11.1.1 No Action

No Action is required for evaluation under the NCP and is the baseline to which other remedial alternatives are compared. No Action may provide an appropriate alternative if no unacceptable risks are present at the AOC. This GRA provides a baseline against which to compare other, more proactive alternatives. No action is taken at the AOC to reduce any hazard to human health or the environment. Any existing actions, such as restrictions or monitoring, are discontinued.

11.1.2 Land Use Controls and Five-Year Reviews

LUCs are non-engineering measures, such as administrative or legal controls, used to prevent or limit exposure to hazardous substances. LUCs do not reduce contaminant volume or toxicity. LUCs are used to supplement engineering controls and are a necessary component of the final remedy.

If LUCs are selected as a component of a remedial alternative that does not achieve unrestricted land use, the effectiveness of the remedy must undergo five-year reviews. The primary goal of the five-year reviews is to evaluate the implementation and performance of the remedy to determine if the remedy is or will be protective of human health and the environment. The five-year reviews are discontinued when the remedy achieves CUGs for residential use and unrestricted release.

11.1.3 Removal

Removal of contaminated media from the AOC reduces or eliminates the potential for long-term human and environmental exposure to chemicals exceeding concentrations determined to be protective for a given land use. Removal of soil may be combined with a form of treatment prior to disposal off-site. Removed soil may also be shipped directly without treatment.

11.1.4 Treatment

Treatment is conducted either in-situ or ex-situ to reduce contaminant concentrations to acceptable levels. Common types of treatment include biological, chemical, physical, and thermal. Biological treatment involves using microbes to degrade contaminants. Chemical treatment processes add chemicals to react with contaminants to reduce their toxicity or mobility. Physical processes involve either physically binding the contaminants to reduce mobility or the potential for exposure (e.g., encapsulation), or extracting the contaminant(s) from a medium to reduce volumes. Thermal treatment such as incineration uses high temperatures to volatilize, decompose, or melt contaminants. For soil treated by ex-situ methods, the treatment may allow soil to be placed back into the excavation, or soil may be treated to reduce the chemical concentration or stabilize the soil prior to off-site disposal.

11.1.5 Disposal and Handling

Disposal and handling involve the final and permanent placement of waste material in a manner protective of human health and the environment. The impacted media is disposed on-site in an engineered facility or off-site in a permitted or licensed facility, such as a regulated landfill. Similarly, concentrated waste resulting from treatment processes is disposed on-site in a permanent disposal cell or off-site in an approved disposal facility. Aqueous media is treated on-site and disposed off-site at a regulated facility.

Transportation is accomplished utilizing vehicles such as truck, railcar, and/or barge.

11.2 INITIAL SCREENING OF TREATMENT TECHNOLOGIES

Table 11-1 summarizes the remedial technologies and process options available for the treatment of COCs in soil. The screening focuses on technology types capable of remediating the COCs present at the AOC and evaluates the implementability of the technology. If treatment technologies are evaluated and retained as potentially viable treatment options for the AOC, the technology will undergo a more detailed evaluation in the following sections.

Table 11-1. Initial Screening of Technologies

General Response Actions	Technology Type	Process Options	Description	Screening Results
No Action	None	None	No action is taken at AOC. Current land use controls, access restrictions, and monitoring programs will be discontinued. No remedial technologies implemented to reduce hazards to potential human or ecological receptors.	Retained. Required to be carried through CERCLA analysis.
Institutional Controls	Access Restrictions	Land Use Controls with CERCLA Five-Year Reviews	Implement Land Use Controls at the area of concern to restrict access and land use. Land Use Controls will be administered and enforced as part of the Property Management Plan and reviewed in CERCLA Five-Year Reviews. Five-Year Reviews include review of sampling and monitoring plans, results of monitoring activities, interviews, inspections, and reviews of AOC status.	Not retained. A remedial alternative selected for manganese at this AOC will achieve an unrestricted scenario. Consequently, land use controls and Five-Year Reviews will not be a technology associated with any remedy.
		Fencing	Place fencing around areas of contamination (at a minimum) to restrict access and exposure to contamination left in place.	Not retained. Using a fence at this area of concern will inhibit planned future military training activities.
Containment	Capping	Native Soil/Sediment	Uses native soil or sediment to cover contamination and reduce migration by wind and water erosion.	Not retained. Using a native soil/sediment cap in areas with contamination will inhibit planned future military training activities.
		Clay	Clay layers are used to cover contamination and eliminate exposure. Installation of clay cap to limit water infiltration. Susceptible to weathering effects (e.g., cracking)	Not retained. Using clay in areas with contamination will inhibit planned future military training activities.
		Synthetic Liner	A synthetic liner is used to cover contamination and limit exposure. Synthetic material used to limit water infiltration, not as susceptible to cracking as clay.	Not retained. Using a synthetic liner cap in areas with contamination will inhibit planned future military training activities.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Containment	Capping	Multi-Layered	Multiple layers of different soil types used to limit water infiltration, not as susceptible to cracking as clay	Not retained. Using a multi-layered cap in areas with contamination will inhibit planned future military training activities.
		Asphalt/Concrete	Asphalt or concrete layers are used to cover contamination and limit exposure. Additionally, this technology limits water infiltration, susceptible to cracking if not properly maintained.	Not retained. Using an asphalt or concrete cap in areas with contamination will inhibit planned future military training activities.
Removal	Bulk Removal	Excavation and Off-Site Disposal	Contaminated material is removed and transported to permitted off-site treatment and disposal facilities.	Retained.
Treatment	In Situ Biological Treatment	Bioventing	Oxygen is delivered to contaminated unsaturated soil by forced air movement (either extraction or injection of air) to increase oxygen concentrations and stimulate biodegradation.	Not retained. Technology focuses on remediation of media contaminated with petroleum hydrocarbons, solvents, pesticides, and other organic chemicals. Not applicable for inorganic constituents.
		Enhanced Bioremediation	Indigenous or inoculated micro-organisms (e.g., fungi, bacteria, and other microbes) degrade (metabolize) organic contaminants found in soil and/or groundwater, converting them to innocuous end products.	Not retained. Technology focuses on remediation of media contaminated with petroleum hydrocarbons, solvents, pesticides, and other organic chemicals. Not applicable for inorganic constituents.
		Phytoremediation	The use of plants to remove, transfer, stabilize, and destroy contaminants in soil and sediment.	Retained.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	In Situ Physical/Chemical Treatment	Chemical Oxidation	Oxidation chemically converts hazardous contaminants to non-hazardous or less toxic compounds that are more stable, less mobile, and/or inert. The oxidizing agents most commonly used are ozone, hydrogen peroxide, hypochlorites, chlorine, and chlorine dioxide.	Not retained. At this time, it is assumed that the areas requiring remediation are not considered hazardous and, therefore, do not need reduction to less toxic compounds for cheaper disposal options.
		Electrokinetic Separation	Removal of inorganic and organic contaminants from low permeability soil, mud, sludge, and marine dredging. Electrokinetic remediation uses electrochemical and electrokinetic processes to desorb, and then remove, inorganic chemicals and polar organic chemicals.	Retained.
		Fracturing	Cracks are developed by fracturing beneath the surface in low permeability and over-consolidated sediment to open new passageways that increase the effectiveness of many in situ processes and enhance extraction efficiencies.	Retained.
		Soil Flushing	Water, or water containing an additive to enhance contaminant solubility, is applied to the soil or injected into the groundwater to raise the water table into the contaminated soil zone. Contaminants are leached into the groundwater, which is then extracted and treated.	Not retained. Although inorganic chemicals can be remediated by this technology, implementation of this technology will not be used since impacting groundwater at this AOC will not be acceptable. Groundwater is still undergoing investigation and determinations if groundwater contaminants exist have yet to be made. Impacting groundwater to treat soil or sediment will not be practical at this point in time.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	In Situ Physical/Chemical Treatment	Soil Vapor Extraction	Vacuum is applied through extraction wells to create a pressure/concentration gradient that induces gas-phase volatiles to be removed from soil through extraction wells. This technology is also known as in situ soil venting, in situ volatilization, enhanced volatilization, or soil vacuum extraction.	Not retained. Technology focuses on remediation of media contaminated with SVOCs, VOCs, and some fuels. Not applicable for inorganic constituents.
		Solidification/Stabilization	Contaminants are physically bound or enclosed within a stabilized mass (solidification), or chemical reactions are induced between the stabilizing agent and contaminants to reduce their mobility (stabilization).	Retained.
	In Situ Thermal Treatment	Thermal Treatment	Steam/hot air injection or electrical resistance/electromagnetic/fiber optic/radio frequency heating is used to increase the volatilization rate of semi-volatiles and facilitate extraction.	Not retained. Technology focuses on remediation of media contaminated with SVOCs and VOCs. Not applicable for inorganic constituents.
	Ex Situ Biological Treatment (assuming excavation)	Biopiles	Excavated soil is mixed with soil amendments and placed in aboveground enclosures. It is an aerated static pile composting process in which compost is formed into piles and aerated with blowers or vacuum pumps.	Not retained. Technology focuses on remediation of media contaminated with VOCs and fuel hydrocarbons. Not applicable for inorganic constituents.
		Composting	Contaminated soil is excavated and mixed with bulking agents and organic amendments, such as wood chips and animal and vegetative waste, which are added to enhance the porosity and organic content of the mixture to be decomposed.	Not retained. Technology focuses on remediation of media contaminated with SVOCs. Not applicable for inorganic constituents.
		Landfarming	Contaminated soil, sediment, or sludge is excavated, applied into lined beds, and periodically turned over or tilled to aerate the waste.	Not retained. Technology focuses on remediation of media contaminated with petroleum hydrocarbons. Not applicable for inorganic constituents.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	Ex Situ Biological Treatment (assuming excavation)	Slurry Phase Biological Treatment	An aqueous slurry is created by combining soil, sediment, or sludge with water and other additives. The slurry is mixed to keep solids suspended and microorganisms in contact with the soil contaminants. Upon completion of the process, the slurry is dewatered and the treated soil is disposed of.	Not retained. Technology has been successfully used to remediate soil, sludges, and sediment contaminated by explosives, petroleum hydrocarbons, petrochemicals, solvents, pesticides, wood preservatives, and other organic chemicals. Not applicable for inorganic constituents.
	Ex Situ Physical/Chemical Treatment (assuming excavation)	Chemical Extraction	Waste-contaminated soil and extractant are mixed in an extractor, thereby dissolving the contaminants. The extracted solution is then placed in a separator, where the contaminants and extractant are separated for treatment and further use.	Not retained. Technology focuses remediation of media contaminated with PCBs, VOCs, halogenated solvents, and petroleum waste. Although the technology is considered suitable for inorganic chemicals, clay content (similar to RVAAP soil) reduces efficiency and traces of solvent may remain in treated media.
		Chemical Reduction/Oxidation	Reduction/oxidation chemically converts hazardous contaminants to non-hazardous or less toxic compounds that are more stable, less mobile, and/or inert. The oxidizing agents most commonly used are ozone, hydrogen peroxide, hypochlorites, chlorine, and chlorine dioxide.	Not retained. At this time, it is assumed that the areas requiring remediation are not considered hazardous and, therefore, do not need reduction to less toxic compounds for cheaper disposal options.
		Dehalogenation	Reagents are added to soil contaminated with halogenated organic chemicals. The dehalogenation process is achieved by either the replacement of the halogen molecules or the decomposition and partial volatilization of the contaminants.	Not retained. Technology focuses remediation of media contaminated with halogenated SVOCs and pesticides. Not applicable for inorganic constituents.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	Ex Situ Physical/Chemical Treatment (assuming excavation)	Soil Washing	Contaminants sorbed onto fine soil particles are separated from bulk soil in an aqueous-based system on the basis of particle size. The wash water may be augmented with a basic leaching agent, surfactant, pH adjustment, or chelating agent to help remove organic chemicals and heavy metals.	Retained.
		Solidification/Stabilization	Contaminants are physically bound or enclosed within a stabilized mass (solidification), or chemical reactions are induced between the stabilizing agent and contaminants to reduce their mobility (stabilization).	Retained.
	Ex Situ Thermal Treatment (assuming excavation)	Hot Gas Decontamination	The process involves raising the temperature of the contaminated equipment or material for a specified period of time. The gas effluent from the material is treated in an afterburner system to destroy all volatilized contaminants.	Not retained. This technology is applicable for process equipment requiring decontamination for reuse. It is also applicable for explosive items, such as mines and shells, being demilitarized (after removal of explosives) or scrap material contaminated with explosives. Not applicable for inorganic constituents.
		Incineration	High temperatures, 870-1,200 °C (1,600- 2,200 °F), are used to combust (in the presence of oxygen) organic constituents in hazardous waste.	Not retained. Technology focuses remediation of media contaminated with explosives and hazardous waste, particularly chlorinated hydrocarbons, PCBs, and dioxins. Not applicable for inorganic constituents.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	Ex Situ Thermal Treatment (assuming excavation)	Pyrolysis	Chemical decomposition is induced in organic material by heat in the absence of oxygen. Organic material is transformed into gaseous components and a solid residue (coke) containing fixed carbon and ash.	Not retained. Technology focuses on remediation of media contaminated with SVOCs and pesticides. Not applicable for inorganic constituents.
		Thermal Desorption	Waste is heated to volatilize water and organic contaminants. A carrier gas or vacuum system transports volatilized water and organic chemicals to the gas treatment system.	Not retained. Technology focuses on remediation of media contaminated with organic constituents. Not applicable for inorganic constituents.

AOC = Area of Concern
CERCLA = Comprehensive Environmental Response, Compensation, and Liability Act
NGB = National Guard Bureau
PCB = Polychlorinated Biphenyl
RVAAP = Ravenna Army Ammunition Plant
SVOC = Semi-volatile Organic Compound
VOC = Volatile Organic Compound

11.3 DETAILED SCREENING OF TECHNOLOGIES

The remedial action technologies retained from the initial screening process are evaluated against criteria of effectiveness, implementability, and cost (three of the NCP balancing criteria). The rationale for either retaining or eliminating treatment options for the AOC is presented and summarized in Table 11-2. The remedial options retained from the detailed screening process develop the remedial alternatives presented in Section 12.0.

11.3.1 Effectiveness

The effectiveness criterion assesses the ability of a remedial technology to protect human health and the environment by reducing the toxicity, mobility, or volume of contaminants. Each technology is evaluated for the ability to achieve RAOs, potential impacts to human health and the environment during construction and implementation, and overall reliability of the technology.

11.3.2 Implementability

Each process option technology is evaluated for implementability in terms of technical feasibility, administrative feasibility, and availability of the necessary material, equipment, and work force. The assessment considers each technology's short- and long-term implementability. Short-term implementability considerations include constructability of the remedial technology, near-term reliability, and the ability to obtain necessary approvals with other agencies and the likelihood of obtaining a favorable community response. Long-term implementability evaluates the ease of undertaking additional remedial actions if necessary, monitoring the effectiveness of the remedy, and operation and maintenance (O&M).

11.3.3 Cost

The cost criterion evaluates each remedial process in terms of relative capital and O&M costs. Costs for each technology are rated qualitatively, on the basis of engineering judgment, in terms of cost effectiveness. Therefore, a low cost remedial technology is rated as highly cost effective, while a costly technology is evaluated as being of low cost effectiveness.

Table 11-2. Detailed Screening of Technologies

General Response Actions	Technology Type	Process Options	Effectiveness	Implementability	Cost	Screening Comments
No Action	None	None	Not effective. Exposure to contaminants left in place goes unsupervised and uncontrolled.	Easy to implement. No activities are implemented.	Low cost. No activities driving cost.	Retained. Required by CERCLA.
Removal	Bulk Removal	Excavation and Off-Site Disposal	Effective. Once the contaminated soil is removed, contaminant exposure to human health and the environment are eliminated.	Moderately easy to implement. Technology has been implemented at RVAAP in the past.	Moderate cost.	Retained.
Treatment	In Situ Biological Treatment	Phytoremediation	Moderate to low effectiveness. Phytoremediation is designed to address inorganic constituents; however, the time required to remediate these constituents is not practical given time constraints to transfer AOC to NGB.	Not easy to implement. The time required for phytoremediation to reduce inorganic constituents in the soil is not practical given time constraints to transfer AOC to NGB. This technology is currently at the demonstration stage and not widely recognized by regulators. Additionally, concentrations can be hazardous to plants and may be mobilized into groundwater or bioaccumulated in animals.	Moderate cost. The cost effectiveness increases as the remedial footprint increases. The area requiring remediation is small; therefore, there is not optimal cost effectiveness.	Not Retained. The time required for phytoremediation to reduce inorganic constituents in the soil is not practical given time constraints to transfer AOC to NGB.
	In Situ Physical/Chemical Treatment	Electrokinetic Separation	Moderate to low effectiveness. Maximum effectiveness occurs if the moisture content is between 14% and 18%. Moisture content of soil is 22.5%.	Not easy to implement. Implementability challenges include additions of acids to soil being remediated. Use of this technology coupled with the risk of adding an additional concern to the environment make this technology not feasible.	High cost. Pilot study is required as few previous studies have been implemented. Pilot study and implementation costs high relative to quantity of soil requiring remediation.	Not Retained. Although potentially effective, a pilot study is required to gauge effectiveness. The time required for electrokinetic separation to reduce inorganic constituents in the soil is not practical given time constraints to transfer AOC to NGB.
		Fracturing	Moderate effectiveness. Effectiveness driven by effectiveness of other in situ treatment.	Moderate to implement. Fracturing of surface soil is easily achievable. However, fractures may close in non-clayey soil.	Moderate cost to high cost. Cost includes cost of other in situ technologies as this technology enhances other in situ technologies.	Not Retained. This technology is used in unison with other in situ technologies. Since no other in situ technologies are retained, this technology is also not retained.
		Solidification/Stabilization	Moderate effectiveness. Effectiveness is gauged by treatability study. Current concentration indicates soil is not hazardous and therefore a small reduction of contaminant concentrations from existing level to cleanup goal is required.	Not easy to implement. Treatability studies are usually required to demonstrate effectiveness. Implementing a treatability study is not practical given time constraints to transfer AOC to NGB.	High cost. Pilot study is required as few previous studies have been implemented. Pilot study and implementation costs high relative to quantity of soil requiring remediation.	Not Retained. Although potentially effective, a pilot study is required to gauge effectiveness. The time required for solidification/stabilization to reduce inorganic constituents in the soil is not practical given time constraints to transfer AOC to NGB.

Table 11-2. Detailed Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Effectiveness	Implementability	Cost	Screening Comments
Treatment	Ex Situ Physical/Chemical Treatment (assuming excavation)	Soil Washing	Moderate effectiveness. Soil washing is more effective at reducing soil with high concentrations of contaminants (e.g., hazardous waste levels). It is assumed the soil is not hazardous waste and only a small reduction is required to achieve cleanup goals.	Not easy to implement. Treatability study may be required to demonstrate effectiveness. Implementing a treatability study is not practical given time constraints to transfer the AOC to NGB. Additionally, an additional treatment step of the washing solvent (potentially a hazardous waste) will be required.	High cost. Soil washing is cost effective with high quantities. However, a relatively low quantity of soil requires remediation.	Not Retained. A treatability study hinders schedule to achieve the U.S. Army's goal for completion. Additionally, the quantity of soil requiring remediation does not result in cost efficiency for this technology.
		Solidification/Stabilization	Moderate effectiveness. The material is not considered hazardous, and there is only a small reduction in chemical concentration to achieve cleanup goals.	Not easy to implement. Treatability studies are usually required to demonstrate effectiveness. Implementing a treatability study is not practical given time constraints to transfer the AOC to NGB.	High cost. Increase in disposal volume as a result of adding solidifying or stabilizing agent.	Not Retained. The material is assumed to not be hazardous and will require only small reduction in chemical concentrations to achieve cleanup goals. It is impractical to solidify or stabilize for such a small change in concentration.

AOC = Area of Concern
CERCLA = Comprehensive Environmental Response, Compensation, and Liability Act
NGB = National Guard Bureau
RVAAP = Ravenna Army Ammunition Plant

12.0 DEVELOPMENT OF REMEDIAL ALTERNATIVES

This section describes the remedial alternatives developed using the GRAs, technology types, and process options presented in Section 11.0. The retained remedial alternatives meet GRAs and are composed of implementable technology types and process options that address COCs in soil at the Building 1200 AOC.

The retained remedial alternatives are:

- Alternative 1: No Action; and
- Alternative 2: Attain National Guard Training and Residential Land Uses.

A detailed description of each remedial alternative is provided in the following sections.

12.1 ALTERNATIVE 1: NO ACTION

The No Action alternative is required for evaluation under the NCP. This alternative is the baseline to which other remedial alternatives are compared. This alternative assumes all current actions (e.g., access restrictions and environmental monitoring) will be discontinued and assumes no future actions will take place to protect human receptors or the environment. Removal or treatment of COCs at the AOC will not be implemented.

12.2 ALTERNATIVE 2: ATTAIN NATIONAL GUARD TRAINING AND RESIDENTIAL LAND USES

Actions for each media within this AOC for this alternative are as follows:

- Shallow Surface Soil (0-1 ft bgs) – Excavation with Off-site Disposal
- Deep Surface Soil (1-4 ft bgs) – NFA
- Subsurface Soil (1-13 ft bgs) – NFA
- Sediment – NFA
- Surface Water – NFA

Implementing shallow surface soil removal in contaminated areas at this AOC is necessary to attain unrestricted (National Guard Training and Residential) land use CUGs, which is the objective of Alternative 2. As stated in previous sections, there are no COCs in deep surface soil, subsurface soil, surface water, and sediment for National Guard Trainee and Resident Farmer receptors; therefore, NFA is required for these media. Alternative 2 consists of excavating shallow surface soil with transportation by truck to an off-site licensed confined disposal facility (CDF) to achieve CUGs for both the Resident Farmer and the National Guard Trainee.

This alternative requires soil removal at sampling locations B12ss-016M and B12ss-017M. The extent of the excavation is depicted on Figure 9-1. The estimated total disposal volume (i.e., ex situ) is approximately 75 yd^3. This extent and total disposal volume assumes a 1 ft bgs excavation and

ISM confirmatory sampling does not result in further lateral soil removal after the initial excavation in sample locations B12ss-016M and B12ss-017M.

This remedial alternative requires coordination of remediation activities with Ohio EPA, OHARNG, and the U.S. Army. Coordinating with stakeholders during implementation of the excavation minimizes health and safety risks to on-site personnel and potential disruptions of RVAAP activities. The time period to complete this remedial action is relatively short and does not include an O&M period to assess impacts from soil. Components of this remedial alternative include:

- Notifications and approvals;
- Remedial Design (RD);
- Waste characterization sampling;
- Site setup, soil excavation, and waste disposal;
- Confirmatory sampling; and
- Restoration.

12.2.1 Notifications and Approvals

Prior to the implementation of this remedial alternative, a review will be conducted to identify any required notifications and approvals. This includes (but is not limited to) obtaining concurrence from the U.S. Fish and Wildlife Service and Ohio Historic Preservation Office and obtaining a jurisdictional or isolated wetland determination (if a wetland is present in the removal area) from USACE-Pittsburgh District and/or the Ohio EPA Division of Surface Water.

12.2.2 Remedial Design

An RD plan will be developed prior to the initiation of remedial actions. This plan will outline construction permitting requirements; site preparation activities (e.g., staging and equipment storage areas, truck routes, storm water controls); the extent of the excavation; sequence of construction activities; decontamination; and segregation, transportation, and disposal of various waste streams. Engineering and administrative controls (e.g., erosion controls, health and safety controls) will be developed during the active construction period to ensure remediation workers and the environment are protected.

12.2.3 Waste Characterization Sampling

Waste characterization samples will be collected from the area requiring removal. The waste characterization samples are collected as ISM samples from the area(s) undergoing this remedy to provide the CDF data to properly profile the waste and determine if it is characteristically nonhazardous or hazardous. Each ISM sample analysis can include (but is not limited to) TCLP metals, TCLP SVOCs, TCLP Pesticides, TCLP Herbicides, Reactive Cyanide, Reactive Sulfide, and PCBs.

As discussed in Section 4.3, the asbestos visual inspection did not identify any asbestos on the ground surface at the AOC. However, the inspection recommended further investigation of a 4 ft high mound near the footprint of former Building T-4602. The investigation of this mound will include intrusive activities to see if asbestos-containing material (ACM) is present. If ACM is present in the mound, a screening may be conducted in accordance with the *Framework for Investigating Asbestos-Contaminated Superfund Sites* (USEPA 2008) to determine if the asbestos is a risk requiring removal. If the presence of asbestos in the mound is determined to be a risk requiring remedy, the remedial design will be updated to address asbestos removal, and the remedial activities will include removal and disposal of the mound.

12.2.4 Site Setup, Soil Excavation, and Waste Disposal

Prior to any ground disturbance, erosion control material such as silt fences and straw bales will be installed prior to minimize sediment runoff. Dust generation will be minimized during excavation activities by keeping equipment movement areas and excavation areas misted with water. The health and safety of remediation workers, on-site RVAAP employees, and the general public will be covered in a site-specific health and safety plan.

To achieve a scenario in which the AOC is protective for unrestricted land use (National Guard Training and the Residential), soil will be removed from locations B12ss-016M and B12ss-017M from 0-1 ft bgs. Soil removal will be accomplished using conventional construction equipment such as backhoes, bulldozers, front-end loaders, and scrapers. Oversize debris will be crushed or otherwise processed to meet disposal facility requirements.

Excavated soil will be hauled by truck to a licensed and permitted CDF. All trucks will be inspected prior to exiting the AOC. Appropriate waste manifests will accompany each waste shipment. Only regulated and licensed transporters and vehicles will be used. All trucks will travel pre-designated routes within RVAAP.

Excavated soil will be disposed at an existing off-site facility licensed and permitted to accept the characterized waste stream. The selection of an appropriate facility will consider the types of waste, location, transportation options, and cost. Waste streams with different constituents and/or characteristics may be generated. Disposal cost savings are possible by utilizing specific disposal facilities for different waste streams.

12.2.5 Confirmatory Sampling

At the end of the soil excavation, confirmatory samples will be collected from excavation sidewalls unless the excavation sidewalls coincide with previously sampled locations deemed not to require remedy. If the excavation is to a minimum of 1 ft bgs, the excavation floor will not require sampling, as there was no identified risk in subsurface soil.

The confirmatory samples are sent to an off-site laboratory to be analyzed for the COC concentration. If the analyses indicate the COC concentration in soil exceeds the CUGs, further excavation will be conducted. If confirmation sample results are less than CUGs, further soil removal will not be required, and the area can be restored.

12.2.6 Restoration

Once it is determined additional excavation will not be required, all disturbed and excavated areas will be backfilled with clean soil and graded to meet neighboring contours. The backfill will come from a source that was previously sampled and approved for use by Ohio EPA. After the area is backfilled and graded, workers will apply a seed mixture (as approved by the OHARNG) and mulch. Restored areas will be inspected and monitored as required in the Storm Water Pollution Prevention Plan (SWPPP).

13.0 ANALYSIS OF REMEDIAL ALTERNATIVES

13.1 INTRODUCTION

This section presents a detailed analysis of the viable remedial alternatives retained and developed through the technology screening process. The purpose of this detailed analysis is to provide stakeholders ample information to identify and select an appropriate remedy and prepare the PP. Based on this detailed analysis of the retained alternatives, one or more is recommended for media requiring remediation at the Building 1200 AOC.

The recommended remedy must meet the following four statutory requirements:

- Be protective of human health and the environment;
- Comply with ARARs (or justification for a waiver);
- Be cost effective; and
- Use permanent solutions and treatment or recovery technologies to the maximum extent practicable.

There are nine established NCP evaluation criteria used to perform a detailed analysis of remedial alternatives to ensure the selected alternative meets the above CECRLA statutory requirements. The nine criteria are grouped into three categories: threshold criteria, balancing criteria, and modifying criteria.

13.1.1 Threshold Criteria

There are two evaluation criteria classified as threshold criteria. This criteria group relates directly to statutory findings. Threshold criteria must be met by the selected remedy. The evaluation criteria in this group are:

1. Overall protection of human health and the environment; and
2. Compliance with ARARs.

Each alternative must be evaluated to determine how it achieves and maintains protection of human health and the environment. An alternative is considered to be protective of human health and the environment if it complies with medium-specific CUGs. Similarly, each remedial alternative must be assessed to determine how it complies with ARARs or, if a waiver is required, an explanation of why a waiver is justified.

13.1.2 Balancing Criteria

There are five evaluation criteria classified as balancing criteria. This group represents the primary criteria upon which the detailed and comparative analysis of each remedial alternative are based. The evaluation criteria in this group are:

1. Long-term effectiveness and permanence;
2. Reduction of toxicity, mobility, or volume through treatment;
3. Short-term effectiveness;
4. Implementability; and
5. Cost.

Long-term effectiveness and permanence is an evaluation of the magnitude of residual risk (risk remaining after implementation of the alternative) and the adequacy and reliability of controls used to manage the remaining waste (untreated waste and treatment residuals) over the long term. Alternatives that provide the highest degree of long-term effectiveness and permanence leave little or no untreated waste at the AOC, make long-term maintenance and monitoring unnecessary, and minimize the need for LUCs.

Reduction of toxicity, mobility, or volume through treatment is an evaluation of the ability of the alternative to reduce the toxicity, mobility, or volume of the waste. The irreversibility of the treatment process and the type and quantity of residuals remaining after treatment also are assessed.

Short-term effectiveness addresses the protection of workers and the community during the remedial action, the environmental effects of implementing the action, and the time required to achieve media-specific preliminary cleanup goals.

Implementability addresses the technical and administrative feasibility of implementing an alternative and the availability of various services and material required during implementation. Technical feasibility assesses the ability to construct and operate a technology, the reliability of the technology, the ease in undertaking additional remedial actions, and the ability to monitor the effectiveness of the alternative. Administrative feasibility is addressed in terms of the ability to obtain approval from federal, state, and local agencies.

Cost provides an estimate of the dollar cost of each alternative. The cost estimates in this report are based on estimating reference manuals, historical costs, vendor quotes, and engineering estimates. Costs are reported in base year 2010 dollars, or present value (future costs are converted to base year 2010 dollars using a 4.125% discount factor). The present value analysis is a method to evaluate expenditures, either capital or O&M, which occur over different time periods. Present value calculations allow for cost comparisons of different remedial alternatives on the basis of a single cost figure. The capital costs have not been discounted due to their relatively short implementation duration. The cost estimates are for guidance in project evaluation and implementation and are believed to be accurate within a range of -30% to +50% in accordance with USEPA guidance

(USEPA 1988a). Actual costs could be higher than estimated due to unexpected conditions or potential delays. Details and assumptions used in developing cost estimates for each of the alternatives are provided in Appendix I.

13.1.3 Modifying Criteria

There are two evaluation criteria categorized as modifying criteria. Modifying criteria are formally evaluated as part of the ROD and after the public has had an opportunity to comment on the PP. This criteria group consists of:

1. State acceptance; and
2. Community acceptance.

State Acceptance considers comments received from agencies of the State of Ohio. Ohio EPA is the primary state agency supporting this investigation. Ohio EPA, as well as other state agencies, will provide comments on the FS and the preferred remedy presented in the PP. This criterion is addressed in the responsiveness summary of the ROD.

Community Acceptance considers comments made by the community, including stakeholders, on the alternatives being considered. Comments will be solicited and accepted from the community on the FS and the preferred remedy presented in the PP. This criterion is addressed in the responsiveness summary of the ROD.

Modifying criteria are future activities. These actions are the same for the retained alternatives. Therefore, the detailed analysis of the remedial alternatives is not included in an evaluation of modifying criteria. The detailed analysis of the retained remedial alternatives for the Building 1200 AOC is presented in the following sections. This analysis is based on seven evaluation criteria (two threshold and five balancing criteria).

13.2 DETAILED ANALYSIS OF REMEDIAL ALTERNATIVES

A detailed analysis of each alternative against the seven NCP evaluation criteria is contained in the following sections and is summarized in Table 13-1. The detailed analysis includes further definition of each alternative (if necessary), compares the alternatives against one another, and presents considerations common to the alternatives.

As presented in Section 12.0, the following remedial alternatives were retained for the Building 1200 AOC:

- Alternative 1: No Action; and
- Alternative 2: Attain National Guard Training and Residential Land Uses.

13.2.1 Alternative 1: No Action

Under this alternative, no remedial actions will take place for any media to meet the RAO. Media with concentrations greater than CUGs will be left in place. Existing access restrictions (e.g., RVAAP perimeter fence) will not be continued. Environmental monitoring will not be performed, and no restrictions on land use are implemented.

13.2.1.1 Overall Protection of Human Health and the Environment

Alternative 1 is not protective of human health for the RAFLU (National Guard Training) or Residential Land Use. Manganese is identified as a COC in ISM surface soil (0-1 ft bgs) samples for both the National Guard Training and Residential Land Uses.

The ERA concluded there is contamination and risk, and important or significant ecological resources exist at the Building 1200 AOC. After Level I and II assessments, including Step 3A, the recommendation is NFA for protection of ecological resources (Section 7.3). Under Alternative 1, current risk is not reduced, and the ecological importance or significance of the AOC remains unchanged. The current land use and RAFLU allows for sustainability of terrestrial habitat for ecological receptors. Wetland habitat in the former settling pond remains undisturbed under Alternative 1.

13.2.1.2 Compliance with ARARs

Potential ARARs for remediation of soil at the Building 1200 AOC are presented in Section 10.0. These enforceable standards are protective of representative receptors under both the National Guard Training and Residential Land Uses that are exposed to COCs at the Building 1200 AOC. There are no chemical-specific, location-specific, and action-specific ARARs identified for Alternative 1.

13.2.1.3 Long-Term Effectiveness and Permanence

Alternative 1 has no long-term management measures to prevent exposures to or the spread of COCs. Existing security will be discontinued, and there is no control of exposure to COCs at the Building 1200 AOC. This alternative does not have controls in place and does not provide any additional controls in the future.

13.2.1.4 Reduction of Toxicity, Mobility, or Volume through Treatment

Alternative 1 does not reduce the toxicity, mobility, or volume of COCs. The alternative does not remove or treat soil with concentrations of COCs above CUGs.

13.2.1.5 Short-Term Effectiveness

Alternative 1 has no additional short-term health risks to the community, remediation workers, or the environment. This remedial alternative offers no short-term benefits or progress to achieve the RAO.

13.2.1.6 Implementability

This alternative does not require any additional effort to implement since it does not change the existing condition at the Building 1200 AOC.

13.2.1.7 Cost

The present value cost to complete Alternative 1 is $0. No capital costs are associated with this alternative.

13.2.2 Alternative 2: Attain National Guard Training and Residential Land Uses

The implementation of Alternative 2 will result in the Building 1200 AOC achieving unrestricted land use (National Guard Training and Residential Land Uses). To achieve unrestricted land use, Alternative 2 will implement excavation and off-site disposal of surface soil with concentrations greater than National Guard Trainee and Residential Farmer CUGs. An estimated 75 yd^3 (ex situ) soil will be excavated and transported (via truck) to an off-site permitted disposal facility. Other technologies will include monitoring, short-term containment, and waste handling via trucks.

13.2.2.1 Overall Protection of Human Health and the Environment

The long-term protectiveness of Alternative 2 is high. Surface soil with concentrations greater than the National Guard Trainee and Resident Farmer CUGs will be excavated and removed from the AOC. The remedial action is protective of human health.

The ERA concluded there is contamination and risk, and important and significant sensitive ecological resources exist at the Building 1200 AOC. After Level I and II assessments, including Step 3A, the recommendation is NFA for protection of ecological resources (Section 7.3). However, this alternative will beneficially reduce existing chemical risks to ecological receptors through removal of soil to attain human health CUGs. Implementation of Alternative 2 will result in temporary vegetation loss and disruption of soil adjacent to excavation areas. Excavation of soil in the vicinity of former Building 1200 will disrupt approximately 1,342 ft^2 (0.03 acres) of the clearing area. The clearing area should recover from excavation activities in one to two years. Like Alternative 1, there would be no alteration to wetland habitat within the former settling pond resulting from this remedial alternative, given there are no remedial actions required for sediment or surface water.

13.2.2.2 Compliance with ARARs

There are no identified chemical-specific or location-specific ARARs for Alternative 2. However, there are action-specific ARARs for this alternative. Action-specific ARARs only apply if the action is taken. Potential ARARs for excavation of soil are presented in Section 10.0. These enforceable standards are protective of representative receptors under both the National Guard Training and Residential Land Uses.

13.2.2.3 Long-Term Effectiveness and Permanence

Alternative 2 effectively will reduce and control COCs in the soil over the long-term. Surface soil above the National Guard Trainee and Resident Farmer CUGs will be excavated and transported to an off-site disposal facility, thereby mitigating risks to human health and the environment. Accordingly, LUCs will not be required at the completion of the removal activities. No CERCLA five-year reviews or O&M sampling will be required.

13.2.2.4 Reduction of Toxicity, Mobility, or Volume through Treatment

Alternative 2 will not achieve a reduction in the toxicity or volume of contaminated media. The mobility of COCs in the excavated soil will be reduced at the off-site disposal facility through engineering controls (e.g., clay liners, geomembranes).

13.2.2.5 Short-Term Effectiveness

There are potential short-term worker and community exposures associated with Alternative 2. Workers will be exposed during the excavation activities. A health and safety plan will identify appropriate personal protective equipment (PPE) for workers minimizes and/or eliminates exposures.

The community near the excavation area and along the route to the disposal facility may be exposed during removal and transportation activities. Mitigation measures during excavation, such as erosion and dust control, will minimize/eliminate potential short-term impacts. The community will be protected during soil transport by inspecting vehicles before and after use, decontaminating as needed, covering the transported waste, observing safety protocols, following pre-designated routes, and limiting the distance to the disposal facility. Transportation risks associated with material leaks increase with distance and volume of material. Transportation of soil to an off-site disposal facility will comply with all applicable state and federal regulations. Pre-designated travel routes will be established, and an emergency response program will be developed to facilitate any potential accident response.

The excavation of the soil and restoration of the AOC is estimated to be completed in approximately one month. Storm water controls will be monitored weekly for six months or until the vegetation is 70% established. Upon the completion of the excavation activities, the Building 1200 AOC will be released for National Guard Training and Residential Land Uses.

13.2.2.6 Implementability

Alternative 2 can be easily implemented after the development of an RD and all appropriate coordination with local, state, and federal agencies is completed. Excavation of surface soil, construction of temporary roads, and waste handling are conventional, straightforward construction techniques and methods. Multiple off-site disposal facilities are available to accept generated waste. Resources (e.g., equipment, material, trained personnel) to implement this alternative are readily available.

Excavation activities are coordinated with RVAAP and OHARNG to minimize disruptions and/or impacts to OHARNG. The RD identifies access routes to the AOC for heavy equipment and steps to minimize potential hazards to on-site personnel. The development of the RD and coordination with local, state, and federal organizations increases the implementation difficulty of Alternative 2 as compared to Alternative 1.

13.2.2.7 Cost

The present value cost to complete Alternative 2 is approximately $123,271 (in base year 2010 dollars with a 4.125% discount factor). This alternative does not include an O&M period subsequent to the soil removal. See Appendix I for a detailed description of Alternative 2 costs.

13.3 COMPARATIVE ANALYSIS OF REMEDIAL ALTERNATIVES USING NCP CRITERIA

In this section, a comparative analysis of the alternatives is conducted to identify relative advantages and disadvantages of each based on the detailed analysis above. The comparative analysis provides a means by which remedial alternatives can be directly compared to one another with respect to common criteria. Overall protection and compliance with ARARs are threshold criteria that must be met by any alternative to be eligible for selection. The other criteria, consisting of short- and long-term effectiveness; reduction of contaminant toxicity, mobility, or volume through treatment; ease of implementation; and cost are the primary balancing criteria used to select a recommended remedy among alternatives that satisfies the threshold criteria. A summary table illustrating the comparative analysis is provided in Table 13-1.

The following remedial alternatives were retained and analyzed in detail:

Alternative 1: No Action; and
Alternative 2: Attain National Guard Training and Residential Land Uses.

The relative advantage and disadvantages of these alternatives are described below. For these evaluations, the term “high” indicates a highly favorable situation, “medium” indicates a moderately favorable situation, and “low” indicates a situation that is not favorable.

13.3.1 Overall Protection of Human Health and the Environment

Alternative 1 does not provide overall protection of human health, as COCs for the National Guard Trainee and Resident Farmer remain on-site. Human health COCs will remain in soil, and the current risk to ecological receptors and ecological importance or significance of the AOC will remain unchanged.

Alternative 2 will provide protection of human health through removal of contamination and will not require additional protectiveness after contaminant removal, as the alternative will achieve National Guard Trainee and Resident Farmer Land Uses. Alternative 2 will beneficially reduce exposure and risk to ecological receptors to COCs but will increase physical risk and will temporarily alter a small portion of the terrestrial habitat.

13.3.2 Compliance with ARARs

All alternatives are considered to be in compliance with ARARs. There are no chemical-specific or location-specific ARARs for any of the alternatives. Action-specific alternatives are applicable to Alternative 2, as Alternative 2 will achieve an unrestricted land use scenario.

13.3.3 Long-Term Effectiveness and Permanence

Alternative 1 is rated low in terms of long-term effectiveness in preventing exposures or the spread of contamination. Alternative 1 will not involve any remedial action or LUCs for potential future exposure.

The long-term effectiveness and permanence of Alternative 2 is considered high. This alternative is highly permanent and effective since this alternative will involve the removal of soil containing COCs and achievement of the National Guard Trainee and Resident Farmer CUGs. No LUCs are required after implementation of Alternative 2.

13.3.4 Reduction in Contaminant Volume, Toxicity, and Mobility through Treatment

The ability of Alternatives 1 and 2 to reduce COC volume, toxicity is low since these alternatives do not involve treatment. The mobility of COCs will be reduced for Alternative 2 given the excavated soil will be disposed of at an off-site facility equipped with engineering controls. Because Alternative 1 will not reduce mobility, it is rated low. Alternative 2 is rated medium.

13.3.5 Short-Term Effectiveness

There are no additional short-term risks posed to the community, remedial workers, or the environment with Alternative 1, which presents a favorable position for short-term effectiveness. Therefore the short-term effectiveness of this remedial alternative is rated high.

Alternative 2 will present short-term risk to workers, the community, and the environment during excavation and transportation soil. Mitigation measures (e.g., dust control, storm water controls, site housekeeping activities, covering and cleaning haul trucks) during excavation activities will minimize and/or eliminate all potential risks. RAOs will be achieved within 30 days of implementation. Excavation will result in a temporary loss of vegetated habitat. Short-term environmental impacts are minimized through construction mitigation techniques. Alternative 2 is rated medium for short-term effectiveness.

13.3.6 Implementability

All alternatives are considered implementable on a technical and availability-of-services basis. Alternative 1 as a "No Action" alternative is rated high. Soil removal and disposal should be readily implementable but not as easily as Alternative 1. Therefore, Alternative 2 is assigned a medium rating.

13.3.7 Cost

Costs were estimated for comparison purposes only, and are believed accurate within a range of -30% to +50%. The estimated present value cost (in base year 2010 dollars with a 4.125% discount factor) to complete each of the alternatives is as follows:

Alternative 1:	$	0
Alternative 2:	$	123,271

Table 13-1. Summary of Comparative Analysis of Remedial Alternatives

NCP Evaluation Criteria	Alternative 1: No Action		Alternative 2: Attain National Guard Training and Residential Land Uses	
Threshold Criteria	***Result***		***Result***	
1. Overall Protectiveness of Human Health and the Environment	Not protective		Protective	
2. Compliance with ARARs	Compliant		Compliant	
Balancing Criteria	***Ranking***	***Score***	***Ranking***	***Score***
3. Long-Term Effectiveness and Permanence	Low	1	High	3
4. Reduction of Toxicity, Mobility, or Volume through Treatment	Low	1	Medium	2
5. Short-Term Effectiveness	High	3	Medium	2
6. Implementability	High	3	Medium	2
7. Cost	High	3	Medium	2
Balancing Criteria Score		11		11

ARARs = Applicable or Relevant and Appropriate Requirements
NCP = National Contingency Plan
Scoring for the Balancing Criteria is as follows: High = 3, Medium = 2, Low = 1
High = Highly favorable situation
Medium = Moderately favorable situation
Low = Situation that is not favorable

THIS PAGE INTENTIONALLY LEFT BLANK.

14.0 AGENCY COORDINATION AND PUBLIC INVOLVEMENT

The U.S. Army is the lead agency responsible for executing the CERCLA process and ultimately completing an approved ROD for soil, sediment, and surface water at the Building 1200 AOC. This section reviews actions that have been conducted and presents activities that are planned to ensure the regulatory agencies and members of the public have been provided with appropriate opportunities to stay informed of the progress of the Building 1200 AOC environmental investigation, restoration efforts, and final selection of a remedy.

As described in Section 13.0, two of the nine NCP evaluation criteria are known as "modifying criteria" – state acceptance and community acceptance. These criteria provide a framework for obtaining the necessary agency coordination and public involvement in the remedy selection process.

14.1 STATE ACCEPTANCE

State acceptance considers comments received from agencies of the State of Ohio on the proposed remedial alternatives. Ohio EPA is the lead regulatory agency for supporting remedy of soil, sediment, and surface water at the Building 1200 AOC. This RI/FS report has been prepared in consultation with the Ohio EPA.

Ohio EPA has provided input during the ongoing investigation and report development to ensure the remedy ultimately selected for the Building 1200 AOC is protective of human health and the environment and fulfills the requirements of the DFFO (Ohio EPA 2004). Ohio EPA provided comments on this RI/FS report and will provide comments on the subsequent PP and ROD. The U.S. Army will obtain Ohio EPA concurrence prior to the final selection of the remedy for soil, sediment, and surface water at the Building 1200 AOC.

14.2 COMMUNITY ACCEPTANCE

Community acceptance considers comments provided by community members for each proposed remedial alternative. CERCLA 42 U.S.C. 9617(a) emphasizes early, constant, and responsive community relations. The U.S. Army has prepared a *Community Relations Plan* (USACE 2003b) to facilitate communication between RVAAP and the community surrounding Ravenna, Ohio during environmental investigations and potential remedial action. The plan was developed to ensure the public has convenient access to information regarding project progress. The community relations program interacts with the public through news releases, public meetings, public workshops, and Restoration Advisory Board (RAB) meetings with local officials, interest groups, and the general public.

CERCLA 42 U.S.C. 9617(a) requires an Administrative Record to be established "at or near the facility at issue." Relevant documents regarding RVAAP have been made available to the public for review and comment. The Administrative Record for this project is available at the following location:

Ravenna Army Ammunition Plant
Building 1037
8451 State Route 5
Ravenna, Ohio 44266-9297

Access to RVAAP is restricted but can be obtained by contacting facility management at (330) 358-7311. In addition, an Information Repository of current information and final documents is available to any interested reader at the following libraries:

Reed Memorial Library
167 East Main Street
Ravenna, Ohio 44266

Newton Falls Public Library
204 South Canal Street
Newton Falls, Ohio 44444-1694

Additionally, RVAAP has an online resource for restoration news and information. This website is available at: www.rvaap.org.

Comments will be received from the community upon issuance of the FS and the PP. As required by the CERCLA regulatory process and the RVAAP *Community Relations Plan*, the U.S. Army will hold a public meeting and request public comments on the PP for the Building 1200 AOC. These comments will be considered prior to the final selection of a remedy. Responses to these comments will be addressed in the responsiveness summary of the ROD.

15.0 CONCLUSIONS AND RECOMMENDED ALTERNATIVE

15.1 CONCLUSIONS

The primary purposes of this RI/FS report are to review of the history of the Building 1200 AOC; summarize RI activities; evaluate results of the RI; develop RAOs and remedial alternatives; and present a recommended alternative to address soil, sediment, and surface water at the Building 1200 AOC.

The RAO for the Building 1200 AOC is to prevent: (1) National Guard Trainee exposure to COCs above CUGs in soil, sediment, and surface water; (2) adverse ecological effects from previous AOC activities; and (3) negative groundwater impacts from contaminant migration from source media (e.g., soil and sediment).

To achieve National Guard Training and Residential Land Use standards, remediation of COCs in surface soil is required. Chemical-specific CUGs are established. A combination of the National Guard Trainee and Resident Farmer CUGs provide a baseline for evaluating whether this AOC may be eligible for unrestricted release.

After the identification of COCs and the establishment of CUGs, remedial technologies are screened and the following viable remedial alternatives developed:

Alternative 1: No Action; and
Alternative 2: Attain National Guard Training and Residential Land Uses.

These alternatives are applicable and are compared against one another to provide information of sufficient quality and quantity to justify the selection of a remedy. The following section provides the recommended alternative for the Building 1200 AOC soil, sediment, and surface water.

15.2 RECOMMENDED ALTERNATIVE

The recommended alternative for the Building 1200 AOC is Alternative 2: Attain National Guard Training and Residential Land Uses. This alternative attains CUGs for the National Guard Trainee and Resident Farmer, which provide the requisite level of protectiveness for unrestricted land use. A No Action alternative was also evaluated. However, since the threshold criteria Overall Protectiveness of Human Health and the Environment is not protective, the No Action alternative is eliminated from consideration.

Alternative 2 involves removal of shallow surface soil (0-1 ft bgs) at the Building 1200 AOC that exceeds the manganese CUG for the National Guard Trainee at locations B12ss-016M and B12ss-017M. The shallow surface soil (0-1 ft bgs) will be excavated by mechanical equipment and disposed off-site in an approved, licensed facility. Confirmation samples will be collected along excavation sidewalls using ISM to verify the extent of excavation is below the CUG or if further lateral removal

of soil is required. If the excavation extends to a previously sampled ISM sampling area that had a concentration less than the CUG (e.g., B12ss-021M), excavation will stop and confirmation sampling on the corresponding sidewall will not be required. The excavated areas will be backfilled with clean soil from an Ohio EPA-approved, off-site source and re-vegetated using RVAPP-approved native seed mixtures.

Assuming removal beyond the extent of the B12ss-016M and B12ss-017M is not needed, the cost for the alternative is estimated to be $123,271. Successful implementation of the alternative will attain a requisite level of protectiveness for soil, sediment, and surface water for unrestricted land use (represented by the National Guard Trainee and Resident Farmer receptors). Therefore, LUCs and five-year reviews will not be required following the remedy.

The next step in the CERCLA process is to prepare a PP to solicit public input on the remedial alternatives. The PP will present these alternatives with the preferred remedial alternative for the Building 1200 AOC. Comments on the PP provided by state and federal agencies and the public will be presented in the Responsive Summary Section of the ROD. The ROD will provide a brief summary of the history, characteristics, and risks of the AOC, and will document its selected remedy.

B.0 PROJECT QUALITY ASSURANCE SUMMARY

This summary presents the actions and methodologies undertaken to meet the quality assurance/quality control (QA/QC) goals and objectives during the remedial investigation (RI) at the Building 1200 (RVAAP-13) area of concern (AOC) at the Ravenna Army Ammunition Plant (RVAAP). These goals and objectives were established in the following:

- *Facility-Wide Sampling and Analysis Plan for Environmental Investigations at the Ravenna Army Ammunition Plant* (USACE 2001), herein referred to as the FWSAP;
- *Performance-Based Acquisition 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1* (USACE 2009), herein referred to as the PBA08 SAP;
- Science Applications International Corporation (SAIC) QA Program; and
- U.S. Army Corps of Engineers (USACE), Louisville District QA requirements.

The RI was conducted under one mobilization. The QA/QC objectives were implemented through project-specific procedures and requirements, focusing on field and analytical laboratory activities and project administration.

B.1 FIELD QUALITY ASSURANCE

B.1.1 Readiness Review

SAIC conducted an internal readiness review on January 28, 2010. The purpose of the readiness review was to ensure the following:

1. Project documents [e.g., sampling and analysis plans (SAPs), field change requests (FCRs)] and procedures were approved, controlled, and properly distributed;
2. Assigned personnel were trained prior to field activities;
3. Mobilization and site logistics were established;
4. Laboratories were ready to accept samples;
5. Subcontractors were ready to begin work; and
6. QA systems were implemented.

All elements of the readiness review were completed prior to initiating field activities. The readiness review was approved by the SAIC QA/QC Officer and Project Manager.

B.1.2 Procedures

Standard operating methods for field activities are incorporated into the governing documents for the project. The FWSAP describes the overall approach and methodologies to be used for projects at RVAAP, and the PBA08 SAP details project-specific requirements for field implementation. USACE and the Ohio Environmental Protection Agency (Ohio EPA) reviewed and approved these documents prior to implementation of field activities.

Clarifications and/or planned deviations from either plan were documented as FCRs. Prior to execution of a field change, each FCR was reviewed and approved by USACE and Ohio EPA. A description of each FCR is presented in Section B.3.1 and copies of the FCR are included in Attachment 1 of this appendix.

Any variances from the approved plans or FCRs were documented as Nonconformance Reports (NCRs). There were no variances identified during the implementation of the RI at Building 1200.

B.1.3 Training

Field team personnel were trained in all procedures applicable to their assigned tasks. Training was accomplished through a combination of project kickoff meetings, reading assignments, and on-the-job (OJT) training. Training was documented by the completion of Training Assignment Records (TARs) and verified by the SAIC Field Operations Manager. Copies of TARs and training certificates are in the project file. Copies of training records required for Occupational Safety and Health Administration (OSHA) and U.S. Department of Transportation (USDOT) compliance were on-site during field activities.

B.1.4 Equipment Calibration

Various types of measuring and testing equipment (M&TE) were used during the field investigation. All M&TE was categorized and assigned unique identifiers. An inventory was maintained in an M&TE logbook.

Only equipment with verifiable traceability to nationally recognized standards was used in the field. Instruments were calibrated in accordance with manufacturer's instructions and frequency. Calibration activities and results were documented in the M&TE logbook, as well as source information for all calibration standards and reagents.

Equipment that did not calibrate within manufacturer’s specifications or operate properly in the field was taken out of service and was replaced promptly. Replacement equipment was placed into service upon calibration. The M&TE logbook maintains documentation of all replaced equipment.

B.1.5 Quality Control Samples

Field QC samples collected for this project included trip blanks, equipment rinsate blanks, source water, and field duplicates, as specified in the PBA08 SAP. Field QA split samples were also collected and sent to a USACE contracted QA laboratory, RTI Laboratories, Inc., of Livonia, Michigan. The USACE QA laboratory performed an independent analysis and evaluation of analytical results by the contracted laboratory. Appendix C of this RI/Feasibility Study (FS) report presents an evaluation of data quality and analytical performance with respect to field QC results. Appendix D presents field QC data and analyses of QC samples.

B.1.6 Field Records

Field data, observations, activities, and information were recorded on daily activity logs and sampling forms. These logs and forms were bound in 3-ring binders. Each field team possessed a binder with applicable sampling forms and activity logs. This ensured that all necessary data were entered consistently. Logbook entries were checked for accuracy and completeness by independent reviewers. Field records were collected upon completion of the project and maintained by the SAIC Field Operations Manager.

B.2 ANALYTICAL LABORATORY QUALITY ASSURANCE

SAIC subcontracted White Water Associates, Inc., of Amasa, Michigan, who subcontracted TestAmerica Laboratories, Inc. (herein referred to as TestAmerica) of North Canton, Ohio and West Sacramento, California, to perform chemical analysis of samples collected. The laboratories performing the analyses were certified by the National Environmental Laboratory Accreditation Conference (NELAC) and have submitted the Self Declaration Statement for compliance of the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories Version 3.0 requirements. QA split samples were collected and submitted to an independent USACE, Louisville District QA laboratory (RTI Laboratories, Inc., located in Livonia, Michigan).

B.2.1 Readiness Review

Laboratory QA/QC activities were initiated during the readiness review. The readiness review verified the following:

1. Governing documents and approved analytical methods were controlled and properly distributed;
2. The laboratory was scheduled and ready to conduct the analysis;
3. Logistical coordination was established between the laboratory and the field team; and
4. Laboratory QA programs were consistent and compatible with the project requirements.

B.2.2 Procedures

Prior to initiation of analytical support, SAIC outlined project-specific requirements for White Water Associates, Inc. and TestAmerica that included the following:

- Parameters to be measured;
- Analytical methods;
  - Adherence to U.S. Environmental Protection Agency (USEPA) SW-846 protocols
  - USACE Shell for Analytical Chemistry Requirements, Appendix I EM200-1-3, 1 February 2001
  - DoD QSM for Environmental Laboratories Version 3.0 requirements
  - Louisville QSM Supplement requirements
- Project quantitation goals (sensitivity); and
- Data deliverables requirements.

B.2.3 Laboratory Quality Control

To document laboratory data quality and measure the quality of the analytical process, laboratory QC samples (e.g., method blanks, laboratory control samples, laboratory duplicates, and matrix spike/matrix spike duplicates) and data verification/validation were employed. The results of laboratory QC are discussed in the Data QC Summary Report (Appendix C). Analytical results of laboratory QC samples are included in Appendix D and form the basis of the data verification and evaluation process (Section B.2.5).

B.2.4 Laboratory Documentation

White Water Associates and TestAmerica maintains comprehensive information regarding the entire analytical process. The laboratory delivered summary data packages and electronic deliverables to SAIC consistent with those identified in the USEPA SW-846 protocol for validation and verification. Laboratory QC sample analyses were cross-referenced to the appropriate environmental field sample analyses in the laboratory deliverables.

B.2.5 Data Verification/Validation

Analytical data generated were subjected to data verification by SAIC, as specified in the Facility-Wide Quality Assurance Project Plan (USACE 2001) (herein referred to as the FWQAPP) and the PBA08 SAP. To verify data, analytical results were compared to established criteria to which judgment was rendered regarding the acceptability and qualification of the data (Appendix C). Upon receipt of data packages from the laboratory, the information was subjected to a systematic examination following standardized checklists and procedures to ensure content, presentation, administrative validity, and technical validity. Routine data changes were documented through data change forms. Data deficiencies or formal laboratory-related nonconformances were documented through an NCR process, as required.

In addition to the SAIC data review, a 10% validation of all data will be performed by USACE to prove data usability. This review constitutes comprehensive validation of 10% of the primary dataset; comprehensive validation of the QA split sample dataset; and a comparison of primary sample, field duplicate sample, and field QA split sample information.

B.3 QUALITY ASSURANCE DOCUMENTATION

Primary methods for documenting QA were: (1) FCRs requiring and obtaining USACE and Ohio EPA concurrence; and (2) generating NCRs in accordance with SAIC QA procedures. Copies of FCRs completed during the investigation are included in Attachment 1 of this appendix. There were no NCRs generated for Building 1200 during the implementation of this RI.

B.3.1 Field Change Control

FCRs were submitted to present the rationale and document and approval for any anticipated variances from protocols specified in the FWSAP and/or the PBA08 SAP. The FCRs provided clarification to the scope or refinement in the procedural approach to a specific field activity. All FCRs were reviewed and approved by designated technical representatives of USACE and Ohio EPA prior to implementation. None of the FCRs resulted in an adverse impact to project quality, schedule, or scope. Copies of the approved FCRs are included in Attachment 1 of this appendix. The following four FCRs were executed during RI activities at the Building 1200 AOC:

- FCR-RVAAP PBA08RI-002 documented the changes in sampling procedures and analytical methods presented in the approved PBA 08 SAP;

- FCR-RVAAP PBA08RI-003 documented the use of sodium bentonite chips for backfilling surface and subsurface boreholes;

- FCR-RVAAP PBA08RI-006 revised the investigation-derived waste (IDW) management procedure for this project; and

- FCR-RVAAP PBA08RI-007 increased the survey accuracy for sampling locations from 0.2 feet to 3.0 feet.

B.3.2 Nonconformance Reports

NCRs and/or corrective action reports are generated to identify and correct conditions adverse to quality, as described in the field and laboratory QA plans. No NCRs were generated during the Building 1200 AOC RI.

FIELD CHANGE REQUEST (FCR)

FCR NO. FCR-RVAAP PBA08RI-002 DATE INITIATED 02/17/10
PROJECT PBA 2008 Remedial Investigation
CONTRACT NO. GSA Contract No. W912QR-04-D-0028 Delivery Order No. 0001

REQUESTOR IDENTIFICATION
NAME Heather Miller ORGANIZATION SAIC PHONE 330-573-8571

TITLE SAIC Field Operations Manager SIGNATURE

BASELINE IDENTIFICATION
BASELINE(S) AFFECTED ☐ Cost ☐ Scope ☐ Milestone ☒ Method of Accomplishment

AFFECTED DOCUMENT (TITLE, NUMBER AND SECTION)
PBA 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1.

DESCRIPTION OF CHANGE:
SAIC would like to request the approval of a field change to the following sample procedures and analytical methods presented in the approved RI SAP. This request includes all changes discussed on the 2/8/2010 call with USACE, SAIC and RTI. Table 1 presents the requested changes, the justification and concurrence with RTI (USACE split lab) and the impact of not implementing request.

JUSTIFICATION:

These items are being requested to clarify, adjust, and revise the implementation of the PBA08 RI given new information since its "final" submittal and approval. The attached Table 1 presents the additional information on the justification of each requested change.

IMPACT OF NOT IMPLEMENTING REQUEST:

Please see Table 1 for the impact of each requested change.

PARTICIPANTS AFFECTED BY IMPLEMENTING REQUEST:
SAIC Field Manager, SAIC Field Teams, Laboratory and USACE Split Laboratory

FIELD CHANGE REQUEST (FCR-RVAAP PBA08 RI-002)

Table 1

Item Number	Description of Requested Change	Justification of Change	Impact of Not Implementing	Cost of Not Implementing
1	Nitrate Sampling at Load Line 12 SAIC would like to have surface water and wet sediment samples at Load Line 12 analyzed for nitrates to support assessments presented in the Load Line 12 Groundwater Feasibility Study. Wet sediment and Surface Water samples for nitrate will be analyzed by SW-846, 9056A.	Although nitrates were not identified above screening criteria CUGs in surface water and wet sediments samples, SAIC would like to add nitrates to the list of analytes to support the groundwater FS and verify there are no groundwater impacts to surface waters. These methods will also be consistent with methods used by the USACE split laboratory	At this point, it is assumed there is no groundwater and surface water interface of potential nitrate contamination. The additional samples will confirm or deny this assumption.	No cost impact to USACE.
2	Part II QAPP Table 2-1. Sampling and Analytical Requirements SAIC would like to remove cyanide from the list of parameters for all media.	Cyanide was inadvertently not removed from Table 2-1 after USACE and Ohio EPA provided guidance (in September 2009) that cyanide was not part of the RVAAP full suite of parameters. These methods will also be consistent with methods used by the USACE split laboratory	No documentation that cyanide was not included during the implementation of the RI SAP.	No cost impact to USACE.
3	Part II QAPP Table 2-1. Sampling and Analytical Requirements SAIC would like clarify that 43 of the soil samples and one wet sediment sample presented on Table 2-1 as Metals TAL should have been included as a separate analysis for only total chromium (only). Analysis for total chromium by SW-846, 6020 will be added.	Table 2-1 in the QAAP presented total chromium samples within the Metal TAL samples for wet sediment and soil. Only total chromium and hexavalent chromium are required for chromium speciation samples. As in Section 4.1.3 on page 4-4 of the PBA08 RI Work Plan, field duplicates (and associated splits) samples will not be collected for chromium speciation samples.	Total chromium and all other metals in the TAL metals suite would be reported.	No cost impact to USACE.
4	Part II QAPP Table 2-1. Sampling and Analytical Requirements SAIC would like to: - Add method 3541 to pesticides and PCBs to soil and wet sediment. - Replace method 8310 to 8270C for PAHs	Analytical methods were revised to achieve low detection limits for comparisons to CUGs and/or to meet the requirements of the DOD QSM 3.0.. These methods will also be consistent with methods	Actual analytical methods used not documented during implementation of RI SAP	No cost impact to USACE.

FIELD CHANGE REQUEST (FCR-RVAAP PBA08 RI-002)

Item Number	Description of Requested Change	Justification of Change	Impact of Not Implementing	Cost of Not Implementing
	for soil and wet sediment. - Add the following analytical methods to liquid and solid IDW samples: TCLP VOC: 8260B and 5030B TCLP SVOC: 8270C/3620C/3510C TCLP Pesticides: 8081A/3520C/3510C TCLP Herbicides:8151A/3520C/3510C TCLP Metals: 6010B/7470A Total Cyanide: 9010B	used by the USACE split laboratory.		
5	Part II QAPP Table 2-1, Sampling and Analytical Requirements SAIC would like to clarify that our VOC method of analysis is 8260B/5021.	Analytical method 8260B/5035 requires the use of EnCore or TerraCore samplers which is not consistent with the sampling procedures or containers presented in the PBA08 SAP and QAPP (Table 5-1). These methods will also be consistent with methods used by the USACE split laboratory.	Actual analytical methods used not documented during implementation of RI SAP	No cost impact to USACE.

BASELINE IDENTIFICATION
BASELINE(S) AFFECTED ☐ Cost ☐ Scope ☐ Milestone ☒ Method of Accomplishment

AFFECTED DOCUMENT (TITLE, NUMBER AND SECTION)
PBA 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1.

DESCRIPTION OF CHANGE:
SAIC requests approval of the following borehole backfilling procedure to supplement guidance presented in the approved PBA 2008 RI SAP.

All discrete surface locations collected with a bucket hand auger, all subsurface boreholes completed using direct push technology, and all geotechnical samples drilled using 4 ¼" hollow stem augers will be backfilled with USACE approved sodium bentonite chips at the completion of sampling activities. Sodium bentonite chips will be added through the augers as they are removed to prevent bridging within the borehole. Care will be taken to ensure that bridging does not occur in any soil boreholes by tamping and thoroughly hydrating the chips with an USACE approved water source every 5 feet until the boring is filled. Each location will be covered lightly with surrounding soil.

JUSTIFICATION:
The PBA 2008 RI SAP and FW SAP do not provide guidance on the abandonment process with respect to surface soil and subsurface direct push boreholes. SAIC requests using abandonment guidance presented in the current Ohio EPA Technical Guidance Manual for Ground Water Investigations, Chapter 9 (February 2009). This document provides guidance that sodium bentonite chips or pellets should be utilized for boreholes completed above the water table, as the use of a cement or cement-bentonite mixture may shrink when installed above the water table.

All geotechnical borings will be completed above the water table. In addition, all surface soil and subsurface direct push borings are anticipated to be completed above the water table. However, if the water table is encountered in surface soil and subsurface direct push borings, sodium-bentonite chips are still the preferred abandonment method, as they will sink through water. This text clarifies SAICs abandonment approach.

IMPACT OF NOT IMPLEMENTING REQUEST:
Surface and subsurface soil borehole (direct push) backfilling activities will not be formally documented/approved.

PARTICIPANTS AFFECTED BY IMPLEMENTING REQUEST:
SAIC Field Manager, SAIC Field Teams and Drilling Subcontractor.

FIELD CHANGE REQUEST (FCR-RVAAP PBA08RI-006)

Table 1

Item Number	Description of Requested Change	Justification of Change	Impact of Not Implementing	Cost of Not Implementing
1	IDW- PPE and Expendable Sampling Equipment SAIC would like to request that only potentially contaminated PPE and expendable sampling equipment be drummed and disposed as non-hazardous waste. These items would be field screened and segregated as specified in Section 7.1 of the FWSAP. Non-contaminated PPE and expendable sampling equipment will be disposed of in sanitary trash.	The PBA 08 RI SAP does not distinguish between potentially contaminated and non-contaminated expendables/solid waste.	Non-contaminated wastes would have to tracked, labeled, sampled, and disposed of as potentially contaminated material.	No cost impact to USACE.
2	IDW - Soil Cuttings SAIC would like to request combining soil cutting from the various AOCs as a best management practice to reduce the number of partially filled soil IDW drums. One composite IDW sample from all drums containing soil cuttings will be collected in accordance with Section 7.4.1 of the FWSAP and characterized for waste disposal at the end of the field cycle.	SAIC does not anticipate large quantities of soil IDW being generated during the investigation given soil borings will be accomplished using direct push technology. Combining the soil cuttings will maximize the use of each drum and minimize the potential for partially filled drums. Based on the sampling results of the previous investigations at the 17 AOCs, the concentrations of potential COCs in soil would not be classified as hazardous waste.	Many of the drums of IDW soil would contain as little as five gallons of soil.	No cost impact to USACE.

BASELINE(S) AFFECTED ☐ Cost ☐ Scope ☐ Milestone ☒ Method of Accomplishment

AFFECTED DOCUMENT (TITLE, NUMBER AND SECTION)
PBA 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1.

DESCRIPTION OF CHANGE:

Survey Precision
The horizontal coordinates of all sampling locations and the corners of MI sample areas presented in the site specific appendices will be marked in the field utilizing a GPS unit within 1 m (3 ft). Elevations of these locations will not be recorded.

For the installation of any future monitoring wells, the location and elevation will be surveyed to an accuracy of 0.06 m (0.2 ft).

JUSTIFICATION:

This change would be to clarify the intention of using a GPS unit to stake locations for the identified MI sampling areas.
A higher resolution survey of monitoring wells (if installed) would be used as presented in the approved PBA 08 RI SAP.

IMPACT OF NOT IMPLEMENTING REQUEST:

As presented, the level of accuracy for obtaining MI sample area corners could only be met utilizing a licensed surveyor. This change clarifies that a GPS unit would be acceptable to mark sample locations. Well installations would be surveyed by a licensed surveyor.

PARTICIPANTS AFFECTED BY IMPLEMENTING REQUEST:

SAIC Field Manager and SAIC Field Teams.

C.0 PROJECT QUALITY ASSURANCE SUMMARY

C.1 PURPOSE OF THIS REPORT

Environmental data must always be interpreted relative to its known limitations and its intended use. As can be expected in environmental media, there are areas and data points where the user needs to be cautioned relative to the quality of the project information presented. The data verification process and this data quality assessment (DQA) are performed to provide current and future data users assistance in the interpretation of these data.

The purpose of this DQA report is to describe:

1. The quality control (QC) procedures followed to ensure data generated by Science Applications International Corporation (SAIC) during the remedial investigations (RIs) at the Ravenna Army Ammunition Plant (RVAAP) meet project requirements;

2. The quality of the data collected; and

3. The problems encountered during the course of the study and their solutions.

A separate Chemical Quality Assessment Report may be completed by the United States Army Corps of Engineers (USACE) quality assurance (QA) representative and would cover data generated from QA split samples remanded to their custody.

This report provides an assessment of the analytical information gathered during the implementation of the RI at Building 1200 at RVAAP. It documents the quality of the data utilized for the RI report and assesses if QA/QC objectives were met. Evaluation of field and laboratory QC measures will constitute the majority of this assessment; however, references also will be directed toward those QA procedures that establish data credibility. The primary intent of this assessment is to illustrate that, except as noted, data generated for this investigation can withstand scientific scrutiny; are appropriate for their intended purpose; are technically defensible; and are of known and acceptable sensitivity, precision, and accuracy.

Multiple activities were performed to achieve the desired data quality for this project. As discussed in the report, decisions were made during the initial scoping of the RI to define the quality and quantity of data required. Data quality objectives (DQOs) were established to guide the implementation of the field sampling and laboratory analysis [refer to the *Performance-Based Acquisition 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No.1* (USACE 2009), herein referred to the PBA08 SAP]. A QA program was established to standardize procedures and to document activities [refer to the *Facility-wide Quality Assurance Project Plan for Environmental Investigations*, herein referred to as the FWQAPP (USACE 2001) and Part II of the PBA08 SAP]. This program provided a means to detect and correct any deficiencies in the process. Upon receipt by

the project team, data were subjected to verification and validation review by an automated data review (ADR) process to identify and qualify problems related to the analysis. These review steps contributed to this final DQA where data in the investigation are identified as having met the criteria and are being utilized appropriately.

C.2 QUALITY ASSURANCE PROGRAM

The FWQAPP and Part II of the PBA08 SAP were developed to guide the RI for Building 1200. The purposes of these documents were to enumerate the quantity and type of samples to be taken to inspect the area of concern (AOC) and to define the quantity and type of QA/QC samples to be used to evaluate the quality of the data obtained. The FWQAPP established requirements for both field and laboratory QC procedures. In general, field QC duplicates and QA split samples were required for each environmental sample matrix collected in the area being investigated; volatile organic compound (VOC) trip blanks were to accompany each cooler containing water samples for VOC determinations; and analytical laboratory QC duplicates, matrix spikes (MSs), laboratory control samples (LCSs), and method blanks were required for each preparation batch of 20 samples or less for each matrix and analyte.

A primary goal of the RVAAP QA program was to ensure that the quality of results for all environmental measurements were appropriate for their intended use. To this end, the FWQAPP and standardized field procedures were compiled to guide the investigation. Through the process of readiness review, training, equipment calibration, QC implementation, and detailed documentation, the project has successfully accomplished the goals set for the QA program.

C.2.1 Monthly Progress Reports

Monthly Progress Reports (MPRs) were completed by the SAIC Project Manager for the duration of the project. The MPRs contained the following information: work completed, problems encountered, corrective actions/solutions, summary of findings, and upcoming work. These reports were issued to the USACE, Louisville District Project Manager by e-mail with copies forwarded to the Ohio Environmental Protection Agency (Ohio EPA). Access to these reports can be obtained through the USACE, Louisville District Project Manager.

C.2.2 Daily Activity Logs

The Field Team Leader completed Daily Activity Logs. These include information such as, but not limited to, on-site sub-tier contractors, equipment on-site, work performed summaries, QC activities, health and safety activities, problems encountered, and corrective actions.

C.2.3 Laboratory "Definitive" Level Data Reporting

The Quality Assurance Project Plan (QAPP) for this project identified requirements for laboratory data reporting and identified TestAmerica Laboratories Inc. (herein referred to as TestAmerica) of North Canton, Ohio (a subcontractor to White Water Associates Inc. of Amasa, Michigan), as the laboratory for the project. During project execution, the TestAmerica facility in North Canton, Ohio, performed all of the analyses, except explosives and propellants, which were performed at the TestAmerica facility in West Sacramento, California. Collected QA split samples were analyzed by USACE's contracted QA laboratory, RTI Laboratories, Inc., of Livonia, Michigan. TestAmerica and RTI Laboratories, Inc. are accredited by the United States Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP). All analytical procedures were completed in accordance with applicable professional standards; United States Environmental Protection Agency (USEPA) requirements; government regulations and guidelines; the DoD Quality Systems Manual (QSM), Version 3; USACE, Louisville District analytical QA guidelines; and specific project goals and requirements. USEPA "definitive" data have been reported, including the following basic information:

- Laboratory case narratives;
- Sample results (soil/sediment reported per dry weight);
- Laboratory method blank results;
- LCS results;
- Laboratory sample MS recoveries;
- Laboratory duplicate results;
- Surrogate recoveries [VOCs, semi-volatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), and explosives];
- Initial and continuing calibrations;
- Sample preparation dates; and
- Sample analysis dates.

This information from the laboratory, along with field information, provides the basis for subsequent data evaluation relative to sensitivity, precision, accuracy, representativeness, and completeness. These are presented in Section C.4.

C.3 DATA VERIFICATION

The objective when evaluating the project data quality is to determine its usability. The evaluation is based on the interpretation of laboratory QC measures, field QC measures, and the project DQOs. This project implemented ADR software to facilitate laboratory data review. The ADR output was reviewed by the project-designated verification staff.

C.3.1 Field Data Verification

Field-generated documents such as sampling logs, boring logs, daily health and safety summaries, daily safety inspections, equipment calibration and maintenance logs, and sample management logs were peer-reviewed on-site.

C.3.2 Laboratory Data Verification

Analytical data generated for this project have been subjected to a process of automated data verification and review. The following describes this systematic process and the evaluation activities performed. Several criteria have been established against which the data were compared and from which a judgment was rendered regarding the acceptance and qualification of the data. Because it is beyond the scope of this report to cite those criteria, the reader is directed to the following documents for specific detail:

- PBA08 SAP.
- DoD – *Quality Systems Manual for Environmental Laboratories*, Version 3, January, 2006.
- USACE Louisville District, *Louisville DoD Quality Systems Manual Supplement*, Version 1, March, 2007.
- USEPA – *Contract Laboratory Program National Functional Guidelines for Organic Data Review*, EPA-540/R-99/008, October, 1999.
- USEPA – *Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, EPA 540/R-94/013, February, 1994.
- SAIC Technical Support Contractor QA Technical Procedure (TP-DM-300-7), *Data Verification and Validation*.

Upon receipt of field and analytical data, verification staff performed a systematic examination of the reports, including ADR software, to ensure the content, presentation, and administrative validity of 100% of the data. Discrepancies identified during this process were recorded and documented utilizing the ADR. Any discrepancies were resolved prior to database flag entry. As part of data verification, standardized laboratory electronic data deliverables were subjected to review. This

technical evaluation ensured that all contract-specified requirements had been met, and that electronic information conformed to reported hardcopy data. Outlier reports from ADR software review are included as Attachment 1 to this appendix. QA Program Nonconformance Report and Corrective Action systems were implemented as required.

During the verification phase of the review and evaluation process, data were subjected to a systematic technical review by examining all field and analytical QC results and laboratory documentation following USEPA functional guidelines, DoD QSM criteria, and SAIC internal procedures for laboratory data review. These data review guidelines define the technical review criteria, methods for evaluating the criteria, and actions to be taken resulting from the review of these criteria. The primary objectives of this phase were to assess and summarize the quality and reliability of the data for the intended use and to document factors that may affect the usability of the data. This process did not include in-depth review of raw data instrument out-put or re-calculation of results from the primary instrument out-put. This data verification and analytical review process included, but was not necessarily limited to, the following parameters:

- Data completeness;
- Analytical holding times and sample preservation;
- Calibration (initial and continuing);
- Method blanks;
- Sample results verification;
- Surrogate recovery;
- LCS analysis;
- Internal standard performance;
- MS recovery;
- Duplicate analysis comparison;
- Reported detection limits;
- Compound, element, and isotope quantification;
- Reported detection levels;
- Method reporting levels; and
- Secondary dilutions.

As an end result of this phase of the review, the data were qualified based on the technical assessment of the verification criteria. Qualifiers were applied by the ADR to each field and analytical result to indicate the usability of the data for its intended purpose.

C.3.3 Definitions of Data Qualifiers (Flags)

During the data verification process, all laboratory data were assigned appropriate data qualification flags and reason codes. Qualification flags are defined as follows:

"U" Indicates the analyte was analyzed for, but not detected above, the level of the associated value.

"J" Indicates the analyte was positively identified; however, the associated numerical value is an approximate concentration of the analyte in the sample.

"UJ" Indicates the analyte was analyzed for, but not detected above, the associated value; however, the reported value is an estimate and demonstrates a decreased knowledge of its accuracy or precision.

"R" Indicates the analyte value reported is unusable. The integrity of the analyte's identification, accuracy, precision, or sensitivity has raised significant questions as to the reality of the information presented.

C.3.4 Data Acceptability

Sixteen environmental soil and 2 field duplicate QC samples were collected with approximately 1,175 discrete analyses (i.e., analytes) being obtained, reviewed, and integrated into the assessment (these totals do not include field measurements and field descriptions). Under the direction of the PBA08 SAP and the USACE, Louisville District, the project successfully collected RI samples and produced acceptable results for 99.7% of the sample analyses performed. Data that were rejected are relegated to antimony non-detectable concentration levels in soil in samples B12SB-027-5084-SO, B12SB-030-5094-SO, B12SB-031-5097-SO, and B12SB-032-5101-SO.

Table C-1 summarizes all targeted field QC and QA split samples collected during the investigation. Cross-references for duplicate and QA split sample pair numbers are presented on Table C-2 along with the requested parameters for each sample. Table C-3 summarizes the results rejected during review, Table C-4 summarizes the qualified analyses grouped by media and analyte category, and Table C-5 shows the individual results qualified during review. The majority of the estimated values were based on values observed between the laboratory method detection levels (MDLs) and the project reporting levels (values determined in this region have an inherently higher variability and need to be considered estimated at best), MS recoveries, surrogate recoveries, and continuing calibrations.

Two equipment rinsates and one deionized source water blank were collected for the entire field cycle. The potable water source was previously tested for use by Ohio EPA and USACE. Approval documentation is referenced under the Performance-Based Acquisition 2008 (PBA08) Sharon Conglomerate Well Installation task. The project goal for blanks is to achieve concentrations less than the reporting levels. Table C-6 summarizes analytes that were detected in these blanks. The potable water blank (SCFqc-001-0001) showed detected concentrations for 12 metals and 8 miscellaneous general chemistry analytes. Of these, barium, calcium, iron, magnesium, manganese, nickel, potassium, sodium, and the general chemistry analytes exceeded their reporting limits. As noted, the results have been previously reviewed and accepted by Ohio EPA and USACE.

Toluene was the only analyte detected in the PBA08 field blank (PBA08-QC-6000-FB) and it was well below the laboratory reporting limit. The PBA08 RI equipment rinsate blanks (PBA08-QC-

6001-ER and PBA08-QC-6002-ER) showed detections for a total of eight metals, five SVOCs, and three VOCs. Of the metals, only manganese and nickel in one rinsate and zinc in both rinsates exceeded the reporting limit, but all except nickel were below 2x the reporting limit. Only one VOC and one SVOC were detected slightly above the reporting limit. These analytes [acetone and bis(2-ethylhexyl)phthalate] are common laboratory contaminants. In general, the field blank and rinsate blank results indicate that the equipment decontamination procedure was effective and the potential for sample contamination due to ambient field conditions is very low.

Table C-1. Number of Samples Taken at the Building 1200 AOC

Media	Environmental Samples	Field Duplicates	USACE Split Samples	Trip Blanks	Equipment Rinse Blanks[a]	Source Water Blanks[b]
Soil	16	2	2	0	2	2

[a]Equipment rinse blanks were collected at a frequency of two per field cycle for the entire Performance Based Acquisition 2008 (PBA08) Remedial Investigation (RI) for the 17 areas of concern (AOCs) as presented in Section 4.6 of the PBA08 Sampling and Analysis Plan (PBA08 SAP).
[b]Source water blanks for deionized and potable water used during equipment decontamination were evaluated for the entire PBA08 RI for the 17 AOCs as presented in Section 4.6 of the PBA08 SAP.
USACE = United States Army Corps of Engineers

[a]Laboratory Qualifiers: B = analyte was detected in the associated blank as well as the sample, J = estimated because result is between the method detection limit and the reporting limit, U = not detected, E = inorganic result estimated because of the presence of interference, and PG = more than 40% difference between primary and confirmation analysis.
[b]Validation Qualifiers: J = estimated, U = not detected, UJ = not detected and reporting limit estimated, and R = rejected.
[c]Validation Reason Codes: CalBlk = calibration blank, CCV = continuing calibration verification, MB = method blank, MS = matrix spike, RptLimit = reporting limit, and Surr = surrogate recovery.

AOC = Area of Concern
PAH = Polycyclic Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
SVOC = Semi-volatile Organic Compound
VOC = Volatile Organic Compound
-- = No qualifier

Explosives, propellants, pesticides, and polychlorinated biphenyls were analyzed for and not detected.
Sample Type: FB = source water blank and ER = equipment rinse blank.
Data Qualifiers: J = estimated, U = not detected, and UJ = not detected and reporting limit estimated.
CAS = Chemical Abstract Service
NA = Not applicable

C.4 DATA QUALITY EVALUATION

C.4.1 Metals Analysis in Soil

Analytical holding times were met for all samples. Initial calibration and continuing calibration, LCS, laboratory duplicate, and serial dilution criteria were achieved for all elements analyzed. Method blank levels or continuing calibration blank levels did result in qualification of eight silver and two cadmium results (4.6% of metals data) as non-detectable concentration "U" or estimated non-detectable concentration "UJ" in most samples. Antimony, arsenic, barium, calcium, chromium, copper, magnesium, nickel, potassium, vanadium, and zinc concentrations were qualified as estimated "J" for 117 results (34% of metals data) due to high or low MS recoveries. However, non-detectable concentration results for antimony were rejected in four samples due to less than 30% recovery. Other metals exhibited acceptable recoveries and were not qualified. Reporting levels are considered to be acceptable relative to the QAPP goals. Dilutions of 1:10 were required to bring concentrations of aluminum in 12 samples and manganese in two samples within the instrument calibration range. Although antimony results were rejected in four samples and some analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible with the exception of antimony. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in the RVAAP Environmental Information Management System (REIMS).

C.4.2 Volatile Organic Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries were low for these analyses, thus causing 70 data points (66.8% of VOC data) to be qualified as estimated "J" or "UJ." Internal standard area counts and compound retention times were acceptable throughout the data analyses. Initial calibration criteria were met for all compounds. Continuing calibration criteria were acceptable for most analytes with the exception of less than negative 20% difference (%D) values for carbon tetrachloride, which caused non-detectable concentration results in one sample to be qualified as estimated "UJ." Method blanks were free of contamination with the exception of low levels of acetone, 2-butanone, 2-hexanone, methylene chloride, toluene, and 4-methyl-2-pentanone. Associated sample results were qualified as non-detectable concentration "U" for acetone, 2-butanone, toluene, and methylene chloride as required. All LCS recoveries were within criteria. MS/matrix spike duplicate (MSD) did not apply to this sample set. No samples required dilutions or re-analyses. Although analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.3 Semi-volatile Organic Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries were acceptable for these analyses. Internal standard area counts and compound retention times were acceptable throughout the data analyses. Initial and continuing calibration criteria were met for all compounds. Method blanks were free of contamination and had no impact on the data. All LCS recoveries were within criteria. MS/MSD recoveries and relative percent difference (RPD) values were acceptable with the exception of low MS recovery values for several polycyclic aromatic hydrocarbon (PAH) analytes. Therefore, based on low MS recoveries, results for acenaphthene, anthracene, benz(a)anthracene, benzo(a)pyrene, chrysene, fluorine, and phenanthrene in parent sample B12SS-036M-5038-SO were qualified as estimated "J" or "UJ" as appropriate. No samples required dilutions or re-analyses. Although a few positive results were qualified as estimated because associated values were less than the reporting levels, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.4 Pesticide Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries were low for pesticide sample B12SB-028-5088-SO, which caused all results for this sample to be qualified as estimated "UJ." All other surrogate recoveries were acceptable. Initial calibration criteria were met for all compounds. Continuing calibration criteria were met with the exception of 4,4'-DDD, which was greater than 15%D and caused 4,4'-DDD in both pesticide samples to be estimated "UJ." Method blanks were free of contamination and had no impact on the sample data. All LCS recoveries were within criteria. Pesticides MS/MSD criteria were within control limits in pesticide sample B12SS-038M-5040-SO. However, MS/MSD recoveries were low and RPD values were high for nine pesticide analytes in sample B12SB-028-5087-SO, which caused the affected analytes in this sample to be qualified as estimated "J" or "UJ." Pesticide samples were reported as dilutions, which resulted in elevated reporting levels. Three samples were analyzed for pesticides, one each at 1:20, 1:5, and 1:2 dilutions. All of the reporting limits were below the Facility-Wide Cleanup Goals (FWCUGs) with the exception of aldrin in sample B12sb-028-5087-SO. However, the MDL was below the FWCUG and concentrations detected between the MDL and reporting limit would have been reported as estimated values. Although analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.5 Polychlorinated Biphenyl Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries were acceptable for all PCB analyses. Initial calibration criteria were met for all compounds. Continuing calibration criteria were met with the exception aroclor-1260, which was greater than 15%D and caused aroclor-1260 in B12SB-028-5087-SO to be estimated "UJ." Method blanks were free of contamination and had no impact on the sample data. All LCS recoveries were within criteria. MS/MSD did not apply to any PCB samples in this data set. No PCB samples required dilutions, and reporting limits met project objectives. Although analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.6 Explosives and Nitroglycerin Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries were acceptable for these analyses. Initial and continuing calibration criteria were met for all compounds. Method blanks were free of contamination and had no impact on the sample data. All LCS recoveries were within criteria. MS recoveries and MS/MSD RPD values were also acceptable. No explosives samples required dilutions. Although a few results were qualified as estimated because they were between the detection limit and the reporting limit, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.7 Nitroguanidine, Nitrocellulose, and Hexavalent Chromium Analysis in Soil

Analytical holding times were met for all samples. Initial and continuing calibration criteria were met for all compounds. Method blanks for nitroguanidine and hexavalent chromium were free of contamination and had no impact on the sample data. However, one method blank contained nitrocellulose at 0.80 mg/kg, which caused this analyte in associated sample B12SS-038M-5040-SO to be qualified as estimated "UJ." All LCS recoveries were within criteria. MS/MSD did not apply to any samples in this data set. No dilutions or re-analyses were required. Although some analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.8 Precision

Field duplicate samples were collected to ascertain the contribution to variability (i.e., precision) due to the combination of environmental media, sampling consistency, and analytical precision. Field duplicate samples were collected from the same spatial and temporal conditions as the primary

environmental sample. Soil samples were collected from the same sampling device, after homogenization, for all analytes except VOCs.

Field duplicate comparison information is presented in Table C-7. If a given analyte was not detected in both the regular and field duplicate sample, precision was considered acceptable and results were not included in the table. The RPD was calculated only when both samples were > 5x the reporting level. When one or both sample values were between the reporting level and 5x the reporting level, the absolute difference (D) was evaluated. Tables 3-1 and 3-2 of the FWQAPP set the RPD criteria at 50% for soil and sediment and at 30% for water while the absolute difference is set at 1x the reporting limit for all matrices. Field duplicate comparisons for the Building 1200 AOC are considered good, with all results below an absolute difference of 1 or an RPD of 50% with the exception of manganese in the soil duplicate at 54% RPD.

C.4.9 Sensitivity

Determination of minimum detectable values allows the investigation to assess the relative confidence that can be placed in a value relative to the magnitude or level of analyte concentration observed. The closer a measured value comes to the minimum detectable concentration, the less confidence and more variation the measurement will have. Project sensitivity goals were expressed as quantitation level goals in the QAPP. These levels were achieved or exceeded throughout the analytical process, with the exception of pesticide analyses which were reported as dilutions. All of the reporting limits for undetected analytes remained below the FWCUGs except for one aldrin result. However, the MDL for aldrin remained below the FWCUG and concentrations detected between the MDL and the reporting limit would have been reported as estimated values. Individual analyte reporting levels varied due to matrix differences and contaminant analyte concentrations. Reporting levels were elevated in soil due to dilution factors, inherent moisture content variability, and results being reported in the standard dry weight format. Reporting level variations have been considered during data interpretation and statistical applications.

Method blank determinations were performed with each analytical sample batch for each analyte under investigation. These blanks were evaluated during data review to determine their potential impact on individual data points, if any. Review action levels are set at 5x the reporting level for all analytes, except those designated as common laboratory contaminants (methylene chloride, acetone, toluene, 2-butanone, and phthalate compounds) with action levels set at 10x reporting levels. During data review, reported sample concentrations are assessed against method blank action levels, and the following qualifications are made when reportable quantities of analytes were observed in the associated method blank.

- When the analyte sample concentration is above 5 or 10x the action level, the data are not qualified and it is considered a positive value.

- When inorganic analyte sample concentrations are determined to be below 5 or 10x the action level, the data are considered impacted by the method blank and the value reported is qualified as

a non-detectable concentration at the analyte value reported. These data are then qualified as "U."

- When organic analyte sample concentrations are determined to be below 5 or 10x the action level, the data are considered impacted by the method blank and the value reported is qualified as a non-detectable concentration. If the reported value is below the reporting level, the result is qualified as a non-detectable concentration at the reporting level. If the result is above the reporting limit, it is qualified as a non-detectable concentration at the analyte value reported. These data are then qualified as "U."

No data were rejected as a result of method blank contamination; however, various analytes were qualified as non-detectable concentration "U" according to the validation in Table C-4.

C.4.10 Representativeness and Comparability

Representativeness expresses the degree to which data accurately reflect the analyte or parameter of interest for the environmental AOC and is the qualitative term most concerned with the proper design of the sampling program. Factors that affect the representativeness of analytical data include proper preservation, holding times, use of standard sampling and analytical methods, and determination of matrix or analyte interferences. Samples were hand-delivered to the laboratory by the TestAmerica courier and were received within temperature specifications and in good condition. A few samples were received at a temperature of 0.8°C. This did not impact the quality of the data. No holding time deviations were observed.

Comparability, like representativeness, is a qualitative term relative to an individual project data set. The RI employed appropriate sampling methodologies, sample containers and preservation, site surveillance, use of standard sampling devices, uniform training, documentation of sampling, standard analytical protocols/procedures, QC checks with standard control limits, and universally accepted data reporting units to ensure comparability to other data sets. Through the proper implementation and documentation of these standard practices, the project has established the confidence that the data will be comparable to other project and programmatic information. Table C-8 presents the standardized parameter groups, sample containers, preservation techniques, and associated holding times for environmental media.

C.4.11 Completeness

Usable data are defined as those data that pass individual scrutiny during the verification and validation process and are accepted for unrestricted application to the human health risk assessment evaluation or equivalent-type applications. Estimated data have been determined to be acceptable for RVAAP project objectives.

The completeness goal for analytical data is 90% as defined in Tables 3-1 and 3-2 of the FWQAPP. The project achieved this goal by collecting all samples presented in the PBA08 SAP and producing usable results for 99.7% of all samples performed.

Table C-7. Field Duplicate Pair Comparisons for Analytes Detected in Samples from the Building 1200 AOC

Sample Identification Numbers	Analysis Type	Chemical	Regular Result	Duplicate Result	RPD % or (Abs. Diff)[a]	Test[b]

[a]RPD is calculated as 100x |R-D|/(R-D)/2, where R is the concentration of the regular sample and D is the concentration of the duplicate. The absolute difference is calculated as |R-D|/L, where L is the average reporting limit of the two samples. Values followed by a "%" are RPD values. Values in parentheses are absolute difference values.

[b]The test used to evaluate the duplicate comparison is the RPD if both sample results were more than 5x the reporting limit or the absolute difference (D) if either result was less than 5x the reporting limit.

*RPD or D outside criteria

Validation Qualifiers: J = estimated and U = not detected.

AOC = Area of Concern D = Duplicate PAH = Polycyclic Aromatic Hydrocarbon RPD = Relative Percent Difference

Table C-8. Container Requirements for Soil Samples at RVAAP

Analyte Group	Container	Minimum Sample Size	Preservative	Holding Time
Volatile Organic Compounds	1 – 2 oz glass jar with septum cap (no headspace)	20 grams	Cool, 4°C	14 d
Semi-volatile Organic Compounds	4 oz glass	30 grams	Cool, 4°C	14 d (extraction) 40 d (analysis)
Pesticide Compounds	4 oz glass	30 grams	Cool, 4°C	14 d (extraction) 40 d (analysis)
PCBs	4 oz glass	30 grams	Cool, 4°C	14 d (extraction) 40 d (analysis)
PAH Compounds	4 oz glass	30 grams	Cool, 4°C	14 d (extraction) 40 d (analysis)
Explosive Compounds	4 oz glass	10 grams	Cool, 4°C	14 d (extraction) 40 d (analysis)
Nitroguanidine	4 oz glass	10 grams	Cool, 4°C	14 d (extraction) 40 d (analysis)
Nitrocellulose	4 oz glass	10 grams	Cool, 4°C	14 d (extraction) 40 d (analysis)
Metals (TAL)	4 oz glass or plastic	20 grams	Cool, 4°C	180 d; Hg @ 28 d
Hexavalent Chromium	4 oz glass	20 grams	Cool, 4°C	24 hr (extraction) 24 hr (analysis)
Geotechnical parameters	Moisture/Density/Porosity/K – Shelby tube TOC – no special container Grain Size Fraction - no special container	Various 100 grams 5000 grams	Air tight, cool Cool N/A	N/A

PCB = Polychlorinated Biphenyl
PAH = Polycyclic Aromatic Hydrocarbon
TAL = Target Analyte List
TOC= Total Organic Content
N/A = Not Applicable
K= Permeability

C.5 DATA QUALITY ASSESSMENT SUMMARY

The overall quality of the Building 1200 RI information meets or exceeds the established project objectives. Through proper implementation of the project data verification and assessment process, project information has been determined to be acceptable for use.

Data, as presented, have been qualified as usable, estimated "J" or "UJ," or rejected "R." Data that have been estimated provide indications of either accuracy, precision, or sensitivity being less than desired but adequate for interpretation. Data that are not acceptable for use have been rejected and were relegated to four non-detectable concentration antimony results. Rejected data comprised 0.34% of the total number of analytes in this data set. Qualifiers have been applied to data when necessary.

Data produced for this project demonstrate they can withstand scientific scrutiny; are appropriate for its intended purpose; are technically defensible; and are of known and acceptable sensitivity, precision, and accuracy. Data integrity has been documented through proper implementation of QA and QC measures. The environmental information presented has an established confidence that allows utilization for the project objectives and provides data for future needs.

Method Blank Result:	15	20	ug/kg	J	Common Contaminant

Acetone contamination found in the method blank did not qualify any samples.

Toluene	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	0.39	5.0	ug/kg	J	

Toluene was qualified due to method blank contamination in the following associated samples:

Client Sample ID	Lab Sample ID	Dilution	Result	Lab Qual	Result Units
ATASS-015M-5036-SO(VOC	A0B180429013	1	0.38	J B	ug/kg

Method Blank Outlier Report

Lab Reporting Batch : A0B180429 **Lab ID:** TALCAN

Analysis Method : 8260B **Analysis Date :** 02/26/2010

Preparation Type : 5030B **Preparation Date :** 02/26/2010

Method Blank Lab Sample ID : A0C010000098B **Preparation Batch :** 0060098

2-Butanone (MEK)	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	**3.4**	**20**	**ug/kg**	**J**	**Common Contaminant**

2-Butanone (MEK) was qualified due to method blank contamination in the following associated samples:

Client Sample ID	Lab Sample ID	Dilution	Result	Lab Qual	Result Units
B12SS-038M-5040-SO(VOC)	A0B180429005	1	3.5	J B	ug/kg

2-Hexanone	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	**1.7**	**20**	**ug/kg**	**J**	

2-Hexanone contamination found in the method blank did not qualify any samples.

Acetone	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	**11**	**20**	**ug/kg**	**J**	**Common Contaminant**

Acetone was qualified due to method blank contamination in the following associated samples:

Client Sample ID	Lab Sample ID	Dilution	Result	Lab Qual	Result Units
B12SS-038M-5040-SO(VOC)	A0B180429005	1	18	J B	ug/kg

QC Outlier Report: Field Duplicates (Non-qualified Outliers)

Lab Report Batch: **Lab ID:**

			Field Sample				Field Sample Duplicate						
Analysis Method	Matrix	Analyte Name	Client Sample ID	Ana Type	Result	Lab Qualifier	Client Sample Duplicate ID	Ana Type	Result	Lab Qualifiers	RPD Dup* (%)	RPD Criteria (%)	Result Units

Note: Outlier report also includes analytes detected in one sample but not in the related sample, i.e., analyte was detected in the field sample but not in the field duplicate sample, or vice versa. In this case, RPD value assigned to the field duplicate sample is 200.

2-Butanone (MEK)	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	3.2	20	ug/kg	J	Common Contaminant

2-Butanone (MEK) contamination found in the method blank did not qualify any samples.

2-Hexanone	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	2.0	20	ug/kg	J	

2-Hexanone contamination found in the method blank did not qualify any samples.

Acetone	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	8.2	20	ug/kg	J	Common Contaminant

Acetone contamination found in the method blank did not qualify any samples.

Method Blank Outlier Report

Lab Reporting Batch : A0B240490 **Lab ID:** TALCAN

Analysis Method : 8260B **Analysis Date :** 03/02/2010

Preparation Type : 5030B **Preparation Date :** 03/02/2010

Method Blank Lab Sample ID : A0C030000288B **Preparation Batch :** 0062288

2-Butanone (MEK)	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	**4.6**	**20**	**ug/kg**	**J**	**Common Contaminant**

2-Butanone (MEK) was qualified due to method blank contamination in the following associated samples:

Client Sample ID	Lab Sample ID	Dilution	Result	Lab Qual	Result Units
B12SB-028-5088-SO	A0B240490004	1	4.4	J B	ug/kg

2-Hexanone	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	**2.7**	**20**	**ug/kg**	**J**	

2-Hexanone contamination found in the method blank did not qualify any samples.

4-methyl-2-pentanone (MIBK)	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	**0.62**	**20**	**ug/kg**	**J**	

4-methyl-2-pentanone (MIBK) contamination found in the method blank did not qualify any samples.

Acetone	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	**11**	**20**	**ug/kg**	**J**	**Common Contaminant**

Acetone was qualified due to method blank contamination in the following associated samples:

Client Sample ID	Lab Sample ID	Dilution	Result	Lab Qual	Result Units
B12SB-028-5088-SO	A0B240490004	1	28	B	ug/kg

Methylene chloride	Result	Reporting Limit	Units	Lab Qual	Comments
Method Blank Result:	**2.1**	**5.0**	**ug/kg**	**J**	**Common Contaminant**

Methylene chloride was qualified due to method blank contamination in the following associated samples:

Client Sample ID	Lab Sample ID	Dilution	Result	Lab Qual	Result Units
B12SB-028-5087-SO	A0B240490003	1	8.2	B	ug/kg
B12SB-028-5088-SO	A0B240490004	1	8.0	B	ug/kg

Surrogate Recovery Outlier Report

Lab Report Batch: A0B240490 **Lab ID:** TALCAN

Client Sample ID	Lab Sample ID	Analysis Method	Dilution	Matrix	Surrogate	Percent Recovery	Criteria (percent) Lower Limit	Upper Limit	Reject Point	Associated Target Analytes

CASE NARRATIVE

CASE NARRATIVE

A0B240490

The following report contains the analytical results for twenty solid samples submitted to TestAmerica North Canton by SAIC from the RVAAP PBA2008 17 AOCS RI Site, project number 172819.00.09456.00.9200.02.200. The samples were received February 24, 2010, according to documented sample acceptance procedures.

The Explosive and Propellant analyses were performed at the TestAmerica West Sacramento Laboratory. Refer to the narrative provided in the West Sacramento package.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. Preliminary results were provided to Heather Miller, Jenny Vance, Marie Simpson, and Richard Sprinzl on March 19, 2010. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Mark J. Loeb, at 330-497-9396.

CASE NARRATIVE (continued)

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 0.8°C.

GC/MS VOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 0062288 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

The client specific or regulatory program requirements stated that corrective action must be performed for surrogate recoveries outside criteria. The re-preparation and re-analysis also had surrogate recoveries outside criteria confirming probable matrix interference; therefore, the original data are contained in the report for samples B12SB-028-5087-SO and B12SB-028-5088-SO.

GC/MS SEMIVOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for B12SB-027-5083-SO and CPCSS-043-5021-SO had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

CASE NARRATIVE (continued)

GC/MS SEMIVOLATILES (cont)

The matrix spike/matrix spike duplicate(s) for batch(es) 0056039 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

Sample CPCSS-043-5021-SO had elevated reporting limits due to matrix interferences.

Two analyses were used to report sample(s) CPCSS-038-5016-SO due to high analyte concentrations.

The QCMRL closer failed for sequence 00311a.D on instrument AG2 for the following compounds Hexachloroethane at 37%, Hexachlorocyclopentadiene at 6%, 2,4 Dinitrophenol at 61% and Benzo(g,h,I)perylene at 54%. MDL checks were run and hexachloropentadiene was noted as a poor performer per the QSM.

The sample, CPCSS-043-5021-SO, and the MS/MSD were analyzed at a 4x dilution due to matrix. The MS recoveries averaged 10% and the MSD recoveries averaged 60%. The sample was past holding time and it was not re-extracted.

POLYCHLORINATED BIPHENYLS-8082

The analytical results met the requirements of the laboratory's QA/QC program.

PESTICIDES-8081

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for B12SB-028-5087-SO had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

The reporting limits are elevated due to the color of the extract for sample(s) B12SB-028-5087-SO and B12SB-028-5088-SO.

CASE NARRATIVE (continued)

NITROAROMATICS AND NITRAMINES-8330

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The analyses reported herein were performed using an instrument that has two columns(GC) or detectors(HPLC), one of which is used to confirm the results of the other. Peak interferences may result in some cases, which cause a quantitation difference between the two columns/detectors. If the difference between the two results is greater than 40%, the higher of the two results or the primary column/detector is normally reported. The reported results are flagged with "PG".

The matrix spike/matrix spike duplicate(s) for CPCSS-043-5021-SO had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

Serial dilution of a sample in this lot indicates that physical and chemical interferences were present. Refer to the sample report pages for the affected analytes flagged with "E".

The sample(s) had elevated reporting limits due to matrix interferences. Refer to the sample report pages for the affected analyte(s) flagged with "G".

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

Matrix spike recovery and relative percent difference (RPD) data were not calculated for some analytes for B12SB-027-5083-SO and CPCSS-043-5021-SO due to the sample concentration reading greater than four times the spike amount. See the Matrix Spike Report for the affected analytes which will be flagged with "NC, MSB".

CASE NARRATIVE (continued)

METALS (cont)

The matrix spike/matrix spike duplicate(s) for B12SB-027-5083-SO and CPCSS-043-5021-SO had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

Some reporting limits are lower than our standard reporting limit (SRL) but are supported by the laboratory's MDL and/or IDLs; however, there are no standards in the calibration curve low enough to support these values(s). The continuing calibration blanks and method blanks may not support the lower RL.

Per client approval, it is acceptable to use the criteria for method blanks(<1/2 the RL or <1/10 the lowest concentration in the associated samples) for CCB's for the metals analysis.

The CCV associated with batch 0056021 exceeded method criteria on the high side for Sodium. Since the results were below the requested reporting limit the results were accepted.

GENERAL CHEMISTRY

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

MANUAL INTEGRATION SUMMARY

Manual integrations were performed on samples(s) reported herein. A list of samples and analytes for which manual integration was necessary is provided following this Case Narrative.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.

California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada (#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190),NAVY, ARMY, USDA Soil Permit

Instrument ID: a4ag2.i
File Name: LV2EJ1AC.D
Inj. Date and Time: 16-MAR-2010 16:45
Manual Integration Reason: Peak not found

Client ID: CPCSS-036-5014-SO
Compound Name: Fluoranthene
Instrument ID: a4ag2.i
File Name: LV2EJ1AC.D
Inj. Date and Time: 16-MAR-2010 16:45
Manual Integration Reason: Peak not found

METHOD SUMMARY

ANALYTICAL METHODS SUMMARY

A0B240490

PARAMETER	ANALYTICAL METHOD
ICP-MS (6020)	SW846 6020
Mercury in Solid Waste (Manual Cold-Vapor)	SW846 7471A
Nitroaromatics and Nitramines by HPLC	SW846 8330B
Nitrocellulose as N, 353.2	MCAWW 353.2
Organics by UV/HPLC	SW846 8330 (Modified)
Organochlorine Pesticides	SW846 8081A
PCBs by SW-846 8082	SW846 8082
Semivolatile Organic Compounds by GC/MS	SW846 8270C
Total Residue as Percent Solids	MCAWW 160.3 MOD
Volatile Organics by GC/MS	SW846 8260B

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Concerning

14. CHAIN OF CUSTODY

The following discrepancies occurred:

15. SAMPLE CONDITION

Sample(s) were received after the recommended holding time had expired.
Sample(s) were received in a broken container.
Sample(s) were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) were further preserved in Sample Receiving to meet recommended pH level(s). *Nitric Acid Lot#* 121709-HNO_3; *Sulfuric Acid Lot#* 082509-H_2SO_4; *Sodium Hydroxide Lot#* 100108 -*NaOH; Hydrochloric Acid Lot#* 092006-*HCl; Sodium Hydroxide and Zinc Acetate Lot#* 100108-$(CH_3COO)_2ZN/NaOH$. What time was preservative added to sample(s)?

Data review checklist: 8260 A/8260B/624 Initial Calibration

Method (check the applicable box): ☐ 8260A ☐8260B ☐ 624

Analysis Date: 2-26-10 **Run batch ID:**_____

Curve ID:_____ **(curve ID must include instrument designation and date reference)**

Acceptance criteria is found in the applicable laboratory SOP. If item is N/A, mark as such in Notes column

Item for review	Level I Yes	Level I No	Level II Yes	Level II No
Tune:				
BFB passes, all points within 12 hr clock (24 hr for 624)	Yes		Yes	
All calibration points ID'd on Calibration Summary Form	Yes		Yes	
Documentation: Raw data and run logs present for all points	Yes		Yes	
Run log and Raw data clearly indicate method by version	Yes		Yes	
RLs: Minimum of 5 points, lowest standards at or below RL	Yes		Yes	
Linearity: 8260 CCCs ≤ 30% RSD	Yes		Yes	
Linear Regression curve fit for all >15% RSD (35% 624) r2>0.980 (r>0.990)	Yes		Yes	
Plots for all Linear Regressions printed	Yes		Yes	
Response: SPCCs all pass minimum response factors	Yes		Yes	
ICV- Second source standard Analytes 60-140% recovery, problem compounds may be allowed outside these limits, but must be evaluated (acrolein, acrylonitrile, 2-ceve, propionitrile, trans 1,4-dichloro-2-butene) Internal Standards 50-200% of recent curve	Yes		Yes	
Manual integrations: necessary, correct & documented	NA		NA	
Other: Verify Avg RF on Cal Summary matches Avg RF on Con Cal form	NA		NA	

Reviewed by Analyst/ Level I: Todd J. Fotta Date: 3-1-10

Reviewed by Peer/Sup/ Level II: Thomas E. Stoller Date: 3/2/10

By signing in "Reviewed by" above I agree that I have reviewed the data as indicated on this checklist.

*Peer/Sup only: In addition to the items above, all manual integrations in this package have been reviewed and found acceptable.

Data review checklist: 8260 A/8260B/624 Initial Calibration

Method (check the applicable box): ☐ 8260A ☒ 8260B ☐ 624

Analysis Date: _____ **Run batch ID:** R001144-IC

Curve ID: R001144/R001144-BR **(curve ID must include instrument designation and date reference)**

Acceptance criteria is found in the applicable laboratory SOP. If item is N/A, mark as such in Notes column

Item for review	Level I Yes	Level I No	Level II Yes	Level II No
Tune:				
BFB passes, all points within 12 hr clock (24 hr for 624)	Yes		Yes	
All calibration points ID'd on Calibration Summary Form	Yes		Yes	
Documentation: Raw data and run logs present for all points	Yes		Yes	
Run log and Raw data clearly indicate method by version	Yes		Yes	
RLs: Minimum of 5 points, lowest standards at or below RL	Yes		Yes	
Linearity: 8260 CCCs ≤ 30% RSD	Yes		Yes	
Linear Regression curve fit for all >15% RSD (35% 624) r2>0.980 (r>0.990)	Yes		Yes	
Plots for all Linear Regressions printed	Yes		Yes	
Response: SPCCs all pass minimum response factors	Yes		Yes	
ICV- Second source standard Analytes 60-140% recovery, problem compounds may be allowed outside these limits, but must be evaluated (acrolein, acrylonitrile, 2-ceve, propionitrile, trans 1,4-dichloro-2-butene) Internal Standards 50-200% of recent curve	Yes		Yes	
Manual integrations: necessary, correct & documented	NA		NA	
Other: Verify Avg RF on Cal Summary matches Avg RF on Con Cal form	NA		NA

INTERNAL STANDARD COMPOUNDS
AREA AND RT SUMMARY

Instrument ID: a3ux14.i
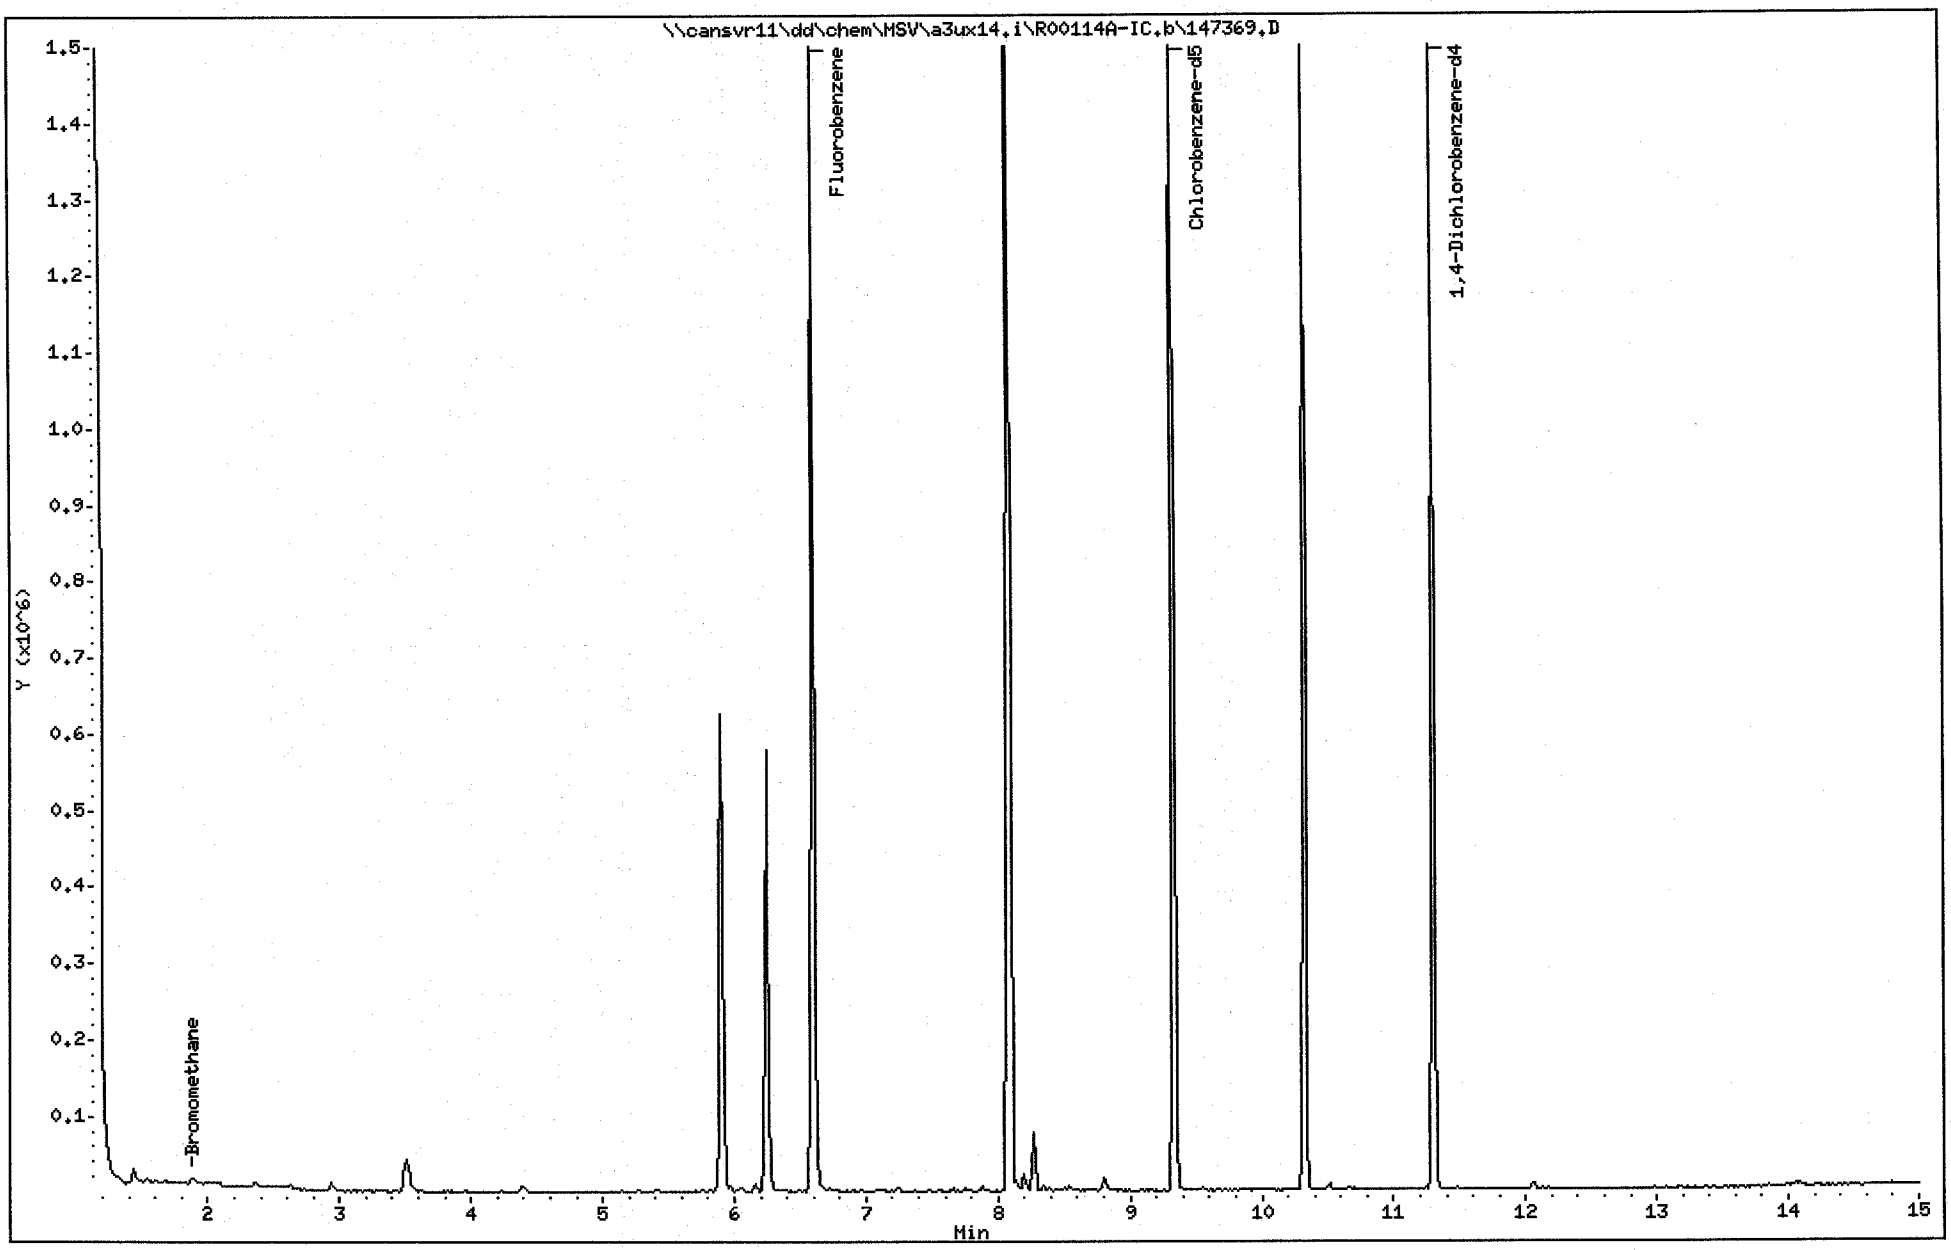
Lab File ID: 147369.D
Lab Smp Id: 5NG-BMIC
Analysis Type: VOA
Quant Type: ISTD
Operator: 2807
Calibration Date: 14-JAN-2010
Calibration Time: 15:16
Level: LOW
Sample Type: SOIL
Method File: \\cansvr11\dd\chem\MSV\a3ux14.i\R00114A-IC.b\8260SUX14.m
Misc Info: R00114A-IC,8260SUX14,BROMO.SUB,2807,1,1

COMPOUND	STANDARD	AREA LIMIT LOWER	AREA LIMIT UPPER	SAMPLE	%DIFF
1 Fluorobenzene	1426757	713379	2853514	1331092	-6.71
2 Chlorobenzene-d5	1019841	509921	2039682	972754	-4.62
3 1,4-Dichlorobenze	550598	275299	1101196	525346	-4.59



COMPOUND	STANDARD	RT LIMIT LOWER	RT LIMIT UPPER	SAMPLE	%DIFF
1 Fluorobenzene	6.60	6.10	7.10	6.60	-0.00
2 Chlorobenzene-d5	9.33	8.83	9.83	9.33	-0.00
3 1,4-Dichlorobenze	11.31	10.81	11.81	11.31	-0.00

AREA UPPER LIMIT = +100% of internal standard area.
AREA LOWER LIMIT = - 50% of internal standard area.
RT UPPER LIMIT = + 0.50 minutes of internal standard RT.
RT LOWER LIMIT = - 0.50 minutes of internal standard RT.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
R - Spike/Surrogate failed recovery limits.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
R - Spike/Surrogate failed recovery limits.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.

1,2-Diphenylhydrazine (as	1500	820	55	144	*	20	1- 175	DIL p

NOTES(S):

DIL The concentration is estimated or not reported due to dilution or the presence of interfering analytes.

p Relative percent difference (RPD) is outside stated control limits.

Results and reporting limits have been adjusted for dry weight.

a Spiked analyte recovery is outside stated control limits.

Column to be used to flag recovery and RPD values with an asterisk
* Values outside of QC limits

RPD: 63 out of 66 outside limits
Spike Recovery: 4 out of 66 outside limits
