Case Narrative

Client: USACE - Louisville
Project: Ravenna AAP, Ravenna, OH
Sample Receipt Date: 11/10-11/2010
SDG #: 82399

Thirty soil samples were received for the Ravenna AAP project. The assigned sample ID number, date sampled, and date received are indicated in the attached Project Summary. The sample was received intact and at a temperature within method specified acceptance limits. A breakdown of sample receipt information can be found on the Sample Condition Report located in the last section of the data package and any exceptions are noted below. The samples were analyzed following the DOD QSM v. 4.1 unless otherwise noted.

The sample was first dried, ground via puck mill and homogenized prior to analysis.

The VOC soil samples that were received on 11/11/2010 in Terra Core kits were received improperly sampled. It appears several plugs of soil were placed in each vial and not a single plug as required. The client was contacted and notified of the issue. The client said to dispose of the VOC samples and they will recollect on a future date.

Analytical run 72179

Continuing calibration verification 2CCV47 analyzed on 12/02/2010 had high responses for the following compounds: 3-nitroaniline (24.6%), 4-nitroaniline (21.8%), benzidine (58.3%), and 3,3'-dichlorobenzidine (42.4%). This CCV also had low responses of the fifth and sixth internal standards, chrysene-d12 and perylene-d12. This CCV was only associated with the confirmation run of LCS 874149.

LCS 874149 had low recoveries of benzidine and pyridine. The recoveries were confirmed by repeat analysis. These compounds were qualified with a "Q" in the associated samples.

The MS and the MSD for sample # 870201 had recoveries outside the QC limits for 4-chloroaniline, 3,3'-dichlorobenzidine, 3-nitroaniline, 4-nitroaniline, aniline, benzidine, benzoic acid, and pyridine.

These results were confirmed by reanalysis, and parent sample results for these compounds were qualified with an "M" flag. All RPDs between the spikes were within the QC limits.

Analytical run 72359

LCS 877492 had a low recovery of pyridine. The recovery was confirmed by repeat analysis. This compound was qualified with a “Q” in the associated samples.

Explosives Analysis Continued:

Several samples contained confirmed positive hits with primary and confirmation analysis values that were greater than 40% different from each other. In this case, the value was reported from the primary data and qualified with a P-flag. The primary and confirmation values are both listed, along with the relative percent difference (RPD) value, in a table that is included in the sample data section of this data package.

All analysis results for this SDG met the method/project specified quality control criteria with following exceptions:

Analytical Run #72413

Samples 870203, 871184, 871186 had high surrogate recoveries. Since there were no analyte hits in the samples, they were not analyzed on the confirmation column. The surrogate was qualified with an "S" flag.

Analytical Run # 72415

2-NT had high recovery in the matrix spike (MS) sample, but there were no analyte hits in the parent sample. No qualification was necessary.

Samples 870203, 871184, 871186 had high surrogate recoveries. Since there were no analyte hits in the samples, they were not analyzed on the confirmation column. The surrogate was qualified with an "S" flag.

Analytical Run #72412

The nitroguanidine (NQ) peak shapes in the client samples on the primary column analysis (sequence 121610NQ-primary) were irregular. They appeared to have something co-eluting with them, but splitting the contaminant from the NQ peak was not a good option. The NQ peaks on the confirmation column analysis had the correct shape and did not appear to have any co-eluting contamination issues. Therefore, all NQ data was reported from the confirmation column analysis on sequence 121610NQic-confirm.

Analytical Run #72414

The nitroguanidine (NQ) peak shapes in the client samples on the primary column analysis (sequence 121610NQ-primary) were irregular. The NQ peaks on the confirmation column analysis had the correct shape and did not appear to have any co-eluting contamination issues. Therefore, all NQ data was reported from the confirmation column analysis on sequence 121610NQic-confirm.

CCV (# 877041) failed high for selenium. The affected sample results were not reported for this element.

Calcium, copper, magnesium and vanadium were detected above the LOD in the calibration blank (CCB # 875080). There were no affected sample results bracketed by this blank.

Barium, copper, and thallium were detected above the LOD in the calibration blank (CCB # 875082); but the associated sample results for barium and copper were greater than 10 times the amount present in the blank. The sample results for these two elements were qualified with a "B" flag. The samples were reanalyzed for thallium.

Barium and copper were detected above the LOD in the calibration blank (CCB # 875747); but the associated sample results were greater than 10 times the amount present in the blank, so the samples were not reanalyzed. The sample results for these two elements were qualified with a "B" flag.

Barium, calcium, copper, magnesium, selenium, thallium and vanadium were detected above the LOD in the calibration blank (CCB # 875749). Metals Analysis Continued:

Calcium was detected above the LOD in the calibration blank (CCB # 878865); but the associated sample results were greater than 10 times the amount present in the blank, so the samples were not reanalyzed. The sample results for this element were qualified with a "B" flag.

Aluminum, iron, manganese and vanadium were detected above ½ the Reporting Limit (RL) in the Method Blank (MBS # 873322). The results for these elements in the associated samples were all greater than 10 times the MBS results; therefore, the sample data was not qualified because of the MBS contamination.

The samples were analyzed at various dilutions to reduce matrix interference and to obtain the results for some of the target elements within the calibration range of the instrument. Thallium, selenium, antimony, and silver were not detected in some of the diluted samples, so they were qualified with a "V" flag in regards to the elevated reporting limits.

Serial Dilution (L) # 875083 failed (10% RPD) for cadmium, copper, iron, selenium and zinc, and Serial Dilution # 877657 failed for thallium. Selenium and thallium were not applicable to the Serial Dilution test because the parent sample (# 870201) results for these elements were not greater than 50 times the Limit of Quantitation (LOQ). Three Post Digestion Spikes (PDSS #'s 875084, 877554, and 876019) were analyzed on this sample. The first PDSS (# 875084) was analyzed with acceptable recoveries for cadmium, selenium and zinc and a failing recovery for iron. The second PDSS (# 877554) was analyzed with an acceptable recovery for copper. The third PDSS (# 877657) was analyzed with an acceptable recovery for thallium. Those elements with acceptable PDSS recoveries were reported without qualification in the parent sample. The elements with failing recoveries were qualified with an "M" flag in the parent sample.

The Matrix Spike (MSS) and/or Matrix Spike Duplicate (MSDS) for sample #870201 failed for copper, iron, selenium, zinc, antimony, silver, lead, manganese, thallium, and chromium. A Serial Dilution was analyzed with an applicable and acceptable result for chromium; therefore, the PDSS result was not applicable for this element. A PDSS (# 875084) was analyzed with acceptable recoveries for selenium, antimony, lead, manganese, thallium and zinc and failing recoveries for iron and silver. PDSS (# 877554) was analyzed with an acceptable recovery for copper. Those elements with acceptable Serial Dilution results or PDSS recoveries were reported without qualification in the parent sample. The elements with failing recoveries were qualified with an "M" flag in the parent sample.

Client: USACE - Louisville
Project: Ravenna AAP, Ravenna, OH
Sample Receipt Date: 11/10-11/2010
SDG #: 82399

Metals Analysis Continued:

The DUP result for silver on sample # 870201 was not applicable because the parent sample result was less than 5 times the Limit of Quantitation (LOQ) for this element. An MSDS was analyzed to demonstrate precision and had an acceptable result.

The Soluble Matrix Spike (MSS), Insoluble Matrix Spike (MSS) and the Post Digestion Spike (PDSS) for sample # 870201 had a low recovery. The sample was reducing in nature. The parent sample result was qualified with an "M" flag.

Analytical Run # 72278

The Insoluble Matrix Spike (MSS) for sample #870189 was inadvertently reported with an over range value. The analyst re-prepped the sample and associated Quality Control samples.
The Soluble Matrix Spike (MSS), Insoluble Matrix Spike (MSS) and the Post Digestion Spike (PDSS) for sample # 870189 had a low recovery. The sample was reducing in nature. The parent sample result was qualified with an "M" flag.

Analytical Run # 72342

The Soluble Matrix Spike (MSS), Insoluble Matrix Spike (MSS) and the Post Digestion Spike (PDSS) for sample # 870194 had a low recovery. The sample was reducing in nature. The parent sample result was qualified with an "M" flag.

MANUAL INTEGRATION REASON CODES

CTLaboratories has identified four general cases with valid reasons supporting the use of manual integration techniques. These codes are used on chromatograms in this data package to document the reasons for manual integrations per CTLaboratories' SOP SS-10 current revision.

#1: **Data system failed to select the correct peak or missed the peak entirely.**
In some cases the chromatography system selects and integrates the "wrong peak". In this case the analyst must correct the selection and force the system to integrate the proper peak. In other instances the system may miss the peak completely. In this case the analyst manually integrated the peak

#2: **Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak.**
This phenomenon is common at low concentrations where the signal to noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low or high area counts for the target compound.

#3: Improperly Integrated Isomers and/or coeluting compounds.
For when the system fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations may be inaccurate, and they must be corrected by manual integration. Prime examples are compounds that are unresolved and integrated improperly when present at low concentrations in standards or samples.

#4: System Established Incorrect Baseline.
There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and may be corrected via manual procedures.

#5: Miscellaneous.
Some situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the group supervisor. If the form of manual integration is not clearly covered by these four cases, then review and approval by the group supervisor or the *QA/QC* Supervisor will be required.

Additional Comments:

The nitroguanidine (NQ) peak shapes in the client samples on the primary column analysis (sequence 121610NQ-primary) were irregular. They appeared to have something co-eluting with them, but splitting the contaminant from the NQ peak was not a good option. The NQ peaks on the confirmation column analysis had the correct shape and did not appear to have any co-eluting contamination issues. Therefore, all NQ data was reported from the confirmation column analysis on sequence 121610NQic-confirm.

Also, because of the contamination issues with NQ on the primary column, in most samples, the NQ result on the primary analysis was greater than 40% different than the NQ result on the confirmation analysis. When this happened, NQ was qualified with a "P" flag and both the primary and confirmation values were listed in a separate table that will accompany the data package.

Additional Comments:

The nitroguanidine (NQ) peak shapes in the client samples on the primary column analysis (sequence 121610NQ-primary) were irregular. They appeared to have something co-eluting with them, but splitting the contaminant from the NQ peak was not a good option. The NQ peaks on the confirmation column analysis had the correct shape and did not appear to have any co-eluting contamination issues. Therefore, all NQ data was reported from the confirmation column analysis on sequence 121610NQic-confirm.

Also, because of the contamination issues with NQ on the primary column, in most samples, the NQ result on the primary analysis was greater than 40% different than the NQ result on the confirmation analysis. When this happened, NQ was qualified with a "P" flag and both the primary and confirmation values were listed in a separate table that will accompany the data package.
