8260 Soil Analyses

Analytical Run # 72301

Level 8 was not used for chloromethane and chloroethane on the initial calibration curve (PS120210) due to loss in linearity. These compounds were not detected above the Level 7 concentration in the associated samples. Level 1 was reanalyzed due to purge/prep error and the reanalyzed point was used (CALW1R). The first ICV was not used because chloroethane had a high recovery and methylene chloride had a low recovery. Another ICV was analyzed that had acceptable recoveries for all target compounds (LCS-ICV1). A number of compounds were calibrated using linear regression.

CCV1 had a high recovery outside specified criteria for chloroethane on a linear regression curve (>20% Drift). This compound was not detected in the associated samples so it was not flagged.

CCV3 had high recoveries outside specified criteria for chloroethane and bromomethane on linear regression curves (>20% Drift). These compounds were not detected in the associated samples so it was not flagged.

Client: USACE - Louisville
Project: Ravenna AAP, Ravenna, OH
Sample Receipt Date: 12/03/2010
SDG #: 82743

Volatile Organics Analysis Continued:

The Matrix Spike (MS) and the Matrix Spike Duplicate (MSD) for sample # 877669 had a high recovery for chloroethane. This compound was not detected in the parent sample so it was not flagged.

The Laboratory Control Sample (LCS) had a high recovery for chloroethane. This compound was not detected in the associated samples so it was not flagged.

Metals Analysis:

The samples were analyzed using US EPA SW-846 methodology 6010B for the ICP metals and 7471 for the mercury. All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

ICP Metals Analysis

Analytical Run # 72492

Antimony and vanadium were detected above the Limit of Detection (LOD) in the calibration blank (ICB # 883618) that was analyzed prior to the sample analysis. There were no affected sample results bracketed by this calibration blank.

Aluminum, calcium, chromium, iron and magnesium were detected above the LOD in the calibration blank (ICB # 884209) that was analyzed prior to the sample analysis. There were no affected sample results bracketed by this calibration blank.

The Continuing Calibration Verification (CCV # 883629) failed for silver and barium, CCV (# 883657) failed for silver, and CCV (# 883661) failed for silver, aluminum, calcium, cadmium and copper. All associated sample results were reanalyzed for these elements.

Client: USACE - Louisville
Project: Ravenna AAP, Ravenna, OH
Sample Receipt Date: 12/03/2010
SDG #: 82743

Metals Analysis Continued:

Barium, calcium, manganese and thallium were detected above the LOD in the calibration blank (CCB # 883630). The results for barium and manganese in the associated samples were all greater than 10 times the amount present in the blank; therefore, the sample results were reported and "B" qualified for these two elements. The associated samples were reanalyzed for calcium and thallium.

Barium, calcium, chromium, magnesium, manganese, selenium, antimony and vanadium were detected above the LOD in the calibration blank (CCB # 883658). The associated sample results greater than ten times the amount present in the blank were reported and qualified with a "B" flag for barium, chromium, magnesium, manganese and vanadium; otherwise, they were reanalyzed. All associated samples were reanalyzed for selenium and antimony.

Barium, chromium and thallium were detected above the LOD in the calibration blank (CCB # 883662), but all of the associated sample results were greater than 10 times the amount present in the blank for barium and chromium; therefore, the sample results were reported and "B" qualified for these two elements. All associated sample results for thallium were less than the LOD; therefore, they were reported without qualification.

Barium and nickel were detected above the LOD in the calibration blank (CCB # 884220), but there were no associated sample results reported for these analytes.

Silver, barium, beryllium, calcium, chromium, nickel and vanadium were detected above the LOD in the calibration blank (CCB # 884223). All of the associated sample results were greater than 10 times the amount present in the blank for calcium; therefore, the results were reported and qualified with a "B" flag for this element. All of the associated sample results were less than LOD for silver; therefore, the results were reported without qualification for this element. There were no associated sample results reported for barium, beryllium, chromium, nickel and vanadium.

Antimony was detected above the LOD, and aluminum, barium, calcium, chromium, iron, magnesium, manganese, vanadium and silver were detected above ½ of the RL in the Method Blank (MBS # 881107). The results for these elements in the associated samples were all greater than 10 times the MBS results, except for the antimony results which were less than the LOD. The sample data was not qualified because of the MBS contamination.

The samples were analyzed at various dilutions to reduce matrix interference and to obtain the results for some of the target elements within the calibration range of the instrument. Thallium, selenium, antimony, and silver were not detected in some of the diluted samples, so they were qualified with a "V" flag in regards to the elevated reporting limits.

Client: USACE - Louisville
Project: Ravenna AAP, Ravenna, OH
Sample Receipt Date: 12/03/2010
SDG #: 82743

Metals Analysis Continued:

The Serial Dilution (L), # 883655, failed (>10% RPD) for arsenic and lead, and Serial Dilution number 884799 failed for aluminum, beryllium, calcium, cadmium, copper, magnesium and antimony. Two Post Digestion Spikes were analyzed. The first PDSS (# 883659) was analyzed with an acceptable recovery for arsenic and a failing recovery for lead. The second PDSS (# 884804) was analyzed with acceptable recoveries for aluminum, beryllium, calcium, cadmium, copper, magnesium and antimony. Those elements with acceptable PDSS recoveries were reported without qualification in the parent sample. The elements with failing recoveries were qualified with an "M" flag in the parent sample.

The Matrix Spike (MSS) and/or Matrix Spike Duplicate (MSDS) for sample number 877664 failed for lead, aluminum, beryllium, calcium, cadmium, copper, magnesium chromium, cobalt, iron, manganese, nickel, vanadium, zinc, antimony, thallium and silver. The Serial Dilution results for chromium, cobalt, iron, manganese, nickel, vanadium and zinc were acceptable and applicable; therefore, the PDSS results were invalid for these elements. These elements were reported without qualification in the parent sample. A PDSS (# 884804) was analyzed with acceptable recoveries for aluminum, beryllium, calcium, cadmium, copper, magnesium, antimony, thallium and silver; therefore, these elements were also reported without qualification in the parent sample.

The Duplicate (DUP) for sample number 877664 failed RPD limits for cadmium. The parent sample result for this element was qualified with a "Y" flag.

The DUP results were not applicable for silver and thallium because the parent sample (# 877664) results were less than 5 times the LOQ. An MSDS was analyzed to demonstrate precision, but the RPD limits were exceeded for both of these elements; therefore, they were qualified with a "Y" flag in the parent sample.

Analytical Run # 72493

The Serial Dilution number 882917 failed for sodium and potassium, but these elements were not applicable to the Serial Dilution test because the parent sample (# 877664) results were not greater than 5 times the LOQ. A PDSS (# 882920) was analyzed with acceptable recoveries for sodium and potassium; therefore, these elements were reported without qualification in the parent sample.

The MSS and MSDS failed for sodium and potassium. A PDSS (# 882920) was analyzed with acceptable recoveries for sodium and potassium; therefore, these elements were reported without qualification in the parent sample.

Sodium and potassium were detected above the LOD in the calibration blanks (CCB #'s 882919 and 882922), but all associated sample results were greater than 10 times the amount present in the blanks. The results for these two elements were reported and qualified with a "B" flag.

Metals Analysis Continued:

CVAA Mercury Analysis

Analytical Run # 72621

The Serial Dilution # 883513 failed for mercury, but this element was not applicable to the Serial Dilution test because the parent sample (# 877664) result was not greater than 5 times the LOQ. A PDSS (# 883514) was analyzed with an acceptable recovery for mercury; therefore, this element was reported without qualification in the parent sample.

The MSS failed for mercury. A PDSS (# 883514) was analyzed with an acceptable recovery for mercury; therefore, this element was reported without qualification in the parent sample.

The Duplicate (DUP) for sample # 877664 failed RPD limits for mercury. The parent sample result for this element was qualified with a "Y" flag.

Analytical Run # 72342

The Soluble Matrix Spike (MSS), Insoluble Matrix Spike (MSS) and the Post Digestion Spike (PDSS) for sample # 870194 had a low recovery. The sample was reducing in nature. The parent sample result was qualified with an "M" flag.

Client: USACE - Louisville
Project: Ravenna AAP, Ravenna, OH
Sample Receipt Date: 12/03/2010
SDG #: 82743

Inorganics Analysis Continued:

The Duplicate, Matrix Spikes (soluble and insoluble), and Post Digestion Spike for this run were performed on a sample from another SDG. The raw data and forms for these were included with this package.

MANUAL INTEGRATION REASON CODES

CTLaboratories has identified four general cases with valid reasons supporting the use of manual integration techniques. These codes are used on chromatograms in this data package to document the reasons for manual integrations per CTLaboratories' SOP SS-10 current revision.

#1: **Data system failed to select the correct peak or missed the peak entirely.**
In some cases the chromatography system selects and integrates the "wrong peak". In this case the analyst must correct the selection and force the system to integrate the proper peak. In other instances the system may miss the peak completely. In this case the analyst manually integrated the peak

#2: **Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak.**
This phenomenon is common at low concentrations where the signal to noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low or high area counts for the target compound.

#3: Improperly Integrated Isomers and/or coeluting compounds.
For when the system fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations may be inaccurate, and they must be corrected by manual integration. Prime examples are compounds that are unresolved and integrated improperly when present at low concentrations in standards or samples.

#4: System Established Incorrect Baseline.
There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and may be corrected via manual procedures.

#5: Miscellaneous.
Some situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the group supervisor. If the form of manual integration is not clearly covered by these four cases, then review and approval by the group supervisor or the *QA/QC* Supervisor will be required.

Was a CCV analyzed after every 12 hour tune check?		Yes		Yes		
Were SPC compounds acceptable?	Avg. RRF> 0.1; 0.3?	Yes		Yes		IF no, analyses stopped
Were CC compounds acceptable?	%D < 20%	Yes		Yes		IF no, analyses stopped
Were all other compounds acceptable?	%D < 20% or project/progam specific		No		No	
If applicable, did the number of failures exceed sporatic marginal failure limits?	<10% failing or see project/program limits		No		No	If yes, samples reanalyzed
If necessary, were the results for outlying compounds qualified?		Yes		Yes		If yes, results qualified "Z"

IV. Blanks						
Was a Method Blank (MB) analyzed prior to analysis of samples?		Yes		Yes		
Were the MB results for all target analytes less than the limit of detection (LOD)?	*All target analytes <LOD or < project/program specific limits		No		No	*see SOP for more detailed criteria
If analytes were detected in the MB with no associated positives in the samples, no further action is needed. If the analyte detects in the MB were greater than the acceptance criteria and there were detects in the samples, was the data qualified.?		Yes		Yes		If yes, affected results qulified "B"
V. Laboratory Control Spike (LCS)						
Was a LCS analyzed at the required frequency?	1 per 20 samples or project/program specific.	Yes		Yes

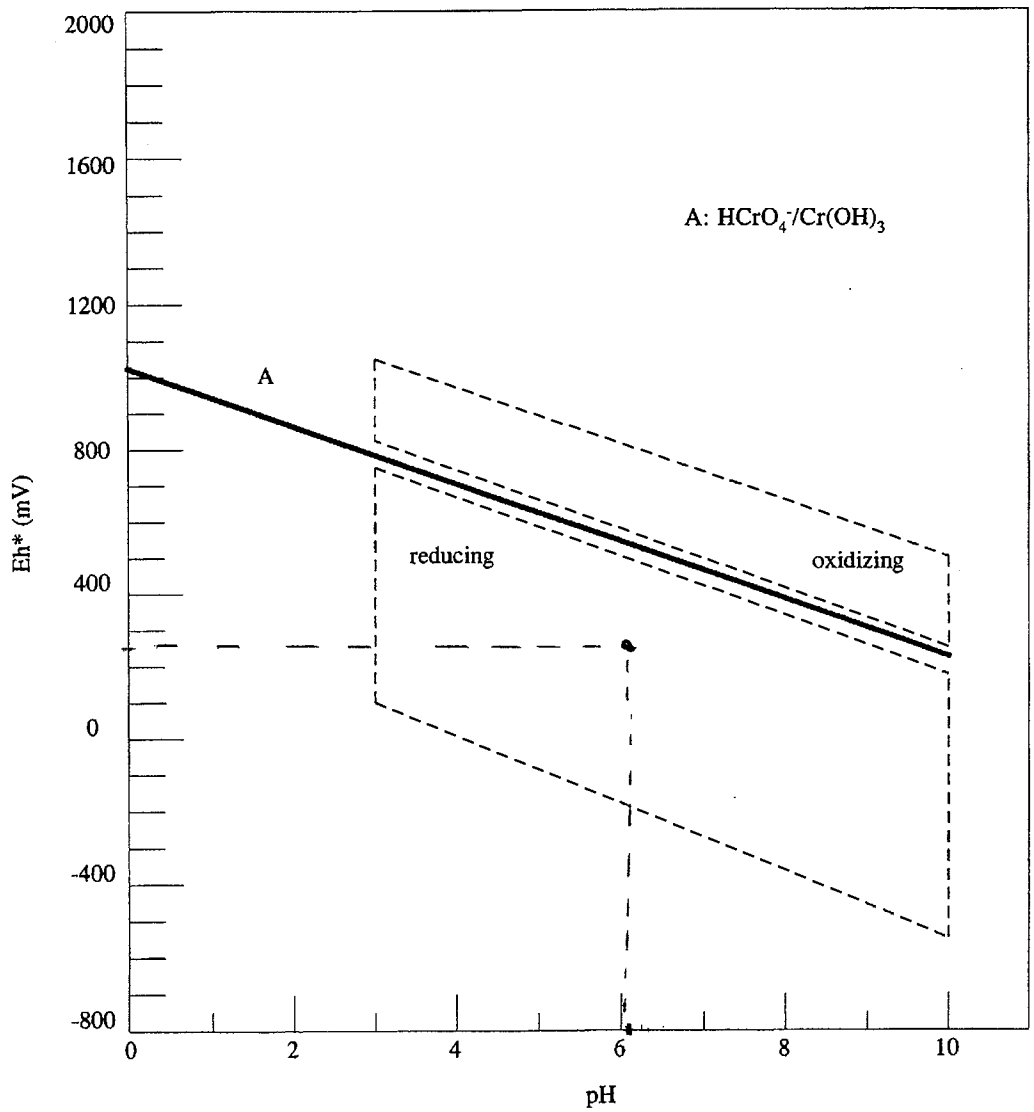
FIGURE 2
Eh/pH PHASE DIAGRAM

The dashed lines define Eh-pH boundaries commonly encountered in soils and sediments.



* Note the Eh values plotted on this diagram are corrected for the reference electrode voltage: 244 mV units must be added to the measured value when a separate calomel electrode is used, or 199 mV units must be added if a combination platinum electrode is used.

pH = 6.08

eH = 46 + 199 = 245

METHOD

Preparation: SW- 846 3550B(Soils)/3510C(Waters)/3580A (Waste dilution)

Analysis: SW-846 8081

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds which yielded a %RSD greater than 20 %, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Continuing Calibration: The CCV's WG351417-02 and 03 yielded differences >20%, biased high, for endosulfan sulfate and endrin ketone on the rear (confirmation) column. All other acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Labortory Control Sample: All acceptance criteria were met.

Matrix Spikes: There were no MS/MSD results associated with this sample delivery group, due to insufficient volume of sample. The laboratory included an LCS and LCS duplicate in the preparation batch in lieu of the NELAC prescribed MS/MSD. Microbac recommends site specific MS/MSD samples to avoid possible data qualification.

SAMPLES

Surrogates: Samples 01 and 02 yielded % recoveries for decachlorobiphenyl that were above the acceptance limit due to SMI. All other acceptance criteria were met.

Endrin/DDT Breakdown: All acceptance criteria were met.

Samples: For all samples which yielded results with an RPD of greater than 40% between the primary and confirmation column the appropriate flag was applied. All acceptance criteria were met.

Manual Integration Reason Codes

Microbac laboratory management has identified four general cases with valid reasons supporting the use of manual integration techniques.

Reason #1: Data System Fails to Select Correct Peak
In some cases the chromatography system selects and integrates the ”wrong peak”. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak.
This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds.
This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline
There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous
Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Laboratory Director or the QA/QC Supervisor will be required.

I certify that this data package is in compliance with the terms and conditions agreed to by the client and Microbac Laboratories Inc., both technically and for completeness, except for the conditions noted above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or designated person, as verified by the following signature.

2.1.1.2 QC Summary Data

Example 8081 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

$$RF = \frac{As}{Cs}$$

where:	Example:
A_s = Area of the compound being measured in the standard	10000
C_s = Concentration of the compound being measured (ng/mL)	100
	RF = 100

2.0 Calculating the concentration (C) of a compound in water using data from prep log and quantitation report:*

$$C = \frac{(A_x)(Vf)(D)}{(RF)(Vi)}$$

where:	Example:
A_x = Area of the compound begin measured	10000
Vf = Final volume of sample extract (mL). (prep log)	1
D = Dilution factor for sample as a multiplier (10X=10)	1
RF = Response factor from ICAL calculated above.	100
Vi = Initial volume of sample (mL). (prep log)	1000
	C(ug/L) = 0.1

3.0 Calculating the concentration (C) of a compound in soil using data from prep log and quantitation report:*

$$C = \frac{(A_x)(Vf)(D)}{(RF)(Wi)}$$

where:	Example:
A_x = Area of the compound begin measured	10000
Vf = Final volume of sample extract (mL). (prep log)	1
D = Dilution factor for sample as a multiplier (10X=10)	1
RF = Response factor from ICAL calculated above.	100
Wi = Initial weight of sample (g).	30
	C(ug/kg) = 3.333333

* Concentrations appearing on instrument quantitation reports are on-column results and do not take into account initial volume, final volume and dilution factor.

Example Percent Solids Calculations

1.0 Calculating the percent solids of a sample.

$$\%Solids = \frac{WT3 - WT1}{WT2 - WT1} \times F$$

Where:	
WT1 = Weight, in grams, of the empty container	1.30 g
WT2 = Weight, in grams, of the container and wet sample	21.274 g
WT3 = Weight, in grams, of the container and dried sample	5.21 g
F = Factor to get units as percent weight	100
%Solids = Percent solids present in sample.	19.58%

2.0 Calculating the percent moisture of a sample.

% Moisture = 100 - % Solids from 1.0 calculation
