Subject: Ohio EPA's Approval of the Army's Final Site Inspection Report, CC-RVAAP-78 Quarry Pond Surface Dump

Dear Mr. Leeper:

The Ohio Environmental Protection Agency (Ohio EPA) has reviewed the Final Revised Site Inspection for CC RVAAP-78 Quarry Pond Surface Dump. The document was received by this office on August 17, 2016. It was originally prepared by Prudent Technologies, Inc., under contract no. W912QR-10-P-0052, but due to the expiration of that contract, it was revised and re-written by the US Army Corps of Engineers.

Ohio EPA approves the document. If you have any questions or concerns related to this review or would like to schedule a meeting or conference call, please free feel to contact me at (330) 963-1170.

Sincerely,

Edward J. D'Amato
Project Coordinator
Ohio EPA - Division of Emergency and Remedial Response

EXECUTIVE SUMMARY

This Site Inspection (SI) documents the environmental investigation and results conducted at the former Ravenna Army Ammunition Plant (RVAAP) in Portage and Trumbull counties, Ohio at Compliance Restoration (CR) Site CC (Army Environmental Compliance-Related Cleanup Program) RVAAP-78 Quarry Pond Surface Dump Area of Concern (AOC). The work for this SI was conducted under the U.S. Department of Defense (DOD) Installation Restoration Program (IRP). Prudent Technologies was contracted by the United States Army Corps of Engineers (USACE), Louisville District to complete this SI under Contract No. W912QR-10-P-0052. The original document entitled "Draft Site Inspection (Phase I Remedial Investigation) Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump, Ravenna Army Ammunition Plant, Ravenna, Ohio" was submitted to the Ohio EPA on July 16, 2012. Due to delays in the overall cleanup program and contractual issues at the former RVAAP that were unrelated to Prudent's performance, Prudent Technology could not complete and revise this document before the Contract ended. Therefore, USACE has revised the original draft and completed this document. Previous versions are withdrawn and replaced by this Final Revised SI.

Planning and performance of all elements of this contract are in accordance with the requirements of the *Ohio Environmental Protection Agency (Ohio EPA) Director's Final Findings and Orders (DFFO) for RVAAP*, dated June 10, 2004 (Ohio EPA, 2004). The DFFO requires conformance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Contingency Plan (NCP) to complete the SI for AOC CC RVAAP-78.

Environmental work at the former Ravenna Army Ammunition Plant began under the Installation Restoration Program in 1989. Currently, there are 67 Areas of Concern (AOC) and 17 Munitions Response Sites (MRS) located throughout Camp Ravenna Joint Military Training Center (CRJMTC). These AOC and MRS sites were identified by the investigation of historical activities which resulted in the identification of contamination at some sites. Historical activities from former load, assemble, and pack activities related to the Ravenna Army Ammunition Plant and associated support operations are the source of the contamination at the installation. CC RVAAP-78 Quarry Pond Surface Dump is one of the AOCs moving through the CERCLA cleanup process and is discussed herein. Due to the AOC's proximity to the Fuze and Booster Quarry Munitions Response Site, anomaly avoidance procedures were taken as a precaution for the potential of encountering Munitions and Explosives of Concern (MEC).

The site inspection conducted for this site included a comprehensive background historical review, presented in the *Final Historical Records Review Report for 2010 Preliminary Assessment Compliance Restoration Sites CC RVAAP-78 Quarry Surface Dump & CC-RVAAP-80 Group 2 Propellant Can Tops*, dated April 2011, and an initial intrusive CC RVAAP-78 investigation, presented herein, to confirm the presence or absence of contamination (Prudent, 2010). The background historical review was intended to better identify the historic uses and potential environmental concerns at these locations with respect to possible Hazardous, Toxic, and Radioactive Waste (HTRW). The data quality objectives of the Intrusive Investigation of CC RVAAP-78 were as follows:

- Conduct Incremental Sampling Methodology (ISM) sampling of surface soils that produce representative and repeatable data

- Conduct ISM sampling of subsurface soils that produce representative and repeatable data
- Provide sufficient Quality Control (QC)/Quality Assurance (QA) sampling to evaluate the overall quality of both the field and laboratory sampling procedures
- Quantify the amount of asbestos in pieces of transite (and roofing) to guide future investigation/removal activities
- Provide sufficient characterization data for disposal of the two rusted 55-gallon drums according to State of Ohio and Federal regulations
- Provide sufficient data to verify that the two rusted 55-gallon drums were disposed according to State of Ohio and Federal regulations
- Provide sufficient analytical data to identify the presence or determine the absence of contamination.

All data quality objectives were met. Twelve subsurface horizontal soil ISM samples (six at 1' – 3' and six at 3' – 5' below ground surface [bgs]), 36 vertical subsurface soil ISM samples (1' – 5' bgs), seven surface soil ISM samples (five at 0 – 0.8' and two at 0 – 1' bgs), seven discrete volatile organic compounds (VOC) surface soil samples, and four suspect asbestos samples (three transite samples along with one roofing sample) were collected and analyzed. Additionally, four samples extracted from the two 55-gallon drums including two surface composite and two surface discrete samples were collected between November 10 and 11, 2011 by a sampling crew four personnel and one UXO technician.

The initial intrusive investigation at CC RVAAP-78 was conducted in November 2011. The investigation included surface soil ISM sampling at the apparent Burn Area and Debris Piles A, B, and C; subsurface soil ISM sampling at Debris Pile C; and sampling of the contents of the two rusted drums.

Transite was observed in both Debris Piles A and B. The surface soil ISM sampling at the apparent Burn Area and Debris Pile C and the subsurface soil ISM sampling at Debris Pile C, was conducted. Asbestos contents of 30 percent and 40 percent were detected in the transite samples from Debris Piles A and B, respectively, and the roofing sample from Debris Pile B had a level of 35 percent asbestos. All the soil samples were analyzed for asbestos. All the soil samples were non-detect or less than 1 percent asbestos, except for sample C78SB-021M-0001-SO, one of the subsurface soil vertical ISM samples from Debris Pile C, which had a level of 2 percent asbestos.

Sampling of the contents of Drum #1 and Drum #2 took place on November 10, 2011. The material within Drum #1 was described as a black/brown tarry, rubbery substance, and the material within Drum #2 was described as a brown organic material which appeared to be dirt, wood, and a squirrel nest. Toxicity Characteristic Leaching Procedure (TCLP) analyses on samples of the contents from the two drums revealed the contents of Drum #1 to be Resource Conservation and Recovery Act (RCRA) characteristic hazardous waste for lead and the contents of Drum #2 to be non-hazardous. Both drums were removed from the site on February 16, 2012 and disposed of according to state and federal requirements.

The maximum surface and subsurface soil chemical concentrations detected during this sampling were assessed to determine if they were SRCs as well as potential contamination in Section 6 of this SI. The *apparent* Burn Area is within the Debris Pile B. The *apparent* Burn Area is within the Debris Pile B. The apparent Burn Area was not individually assessed to determine if SRCs were present because analytes analyzed for in the soil samples were not detected. Additionally, the concentrations of chemicals in the Debris Pile B were much greater and were therefore included as part of Debris Pile B. The data tables arranged by analysis type for the *apparent* Burn Area are presented in Appendix M.

The determination of whether or not contamination is present, follows a process used on Ravenna to identify site-related chemicals (SRCs). In an SI such as this, the presence of SRCs may be defined as contamination or may be further assessed using a weight-of-evidence approach to ensure that the chemical identified as an SRC is truly contamination and not related to non-anthropogenic activities. The following lists the chemicals identified at the AOC as contamination (based on the maximum value) from each Debris Pile:

- Debris Pile A - Surface Soil (Table 6-1):
    - Explosives/Propellants: 1,3-dinitrobenzene (qualified as a U value - non-detect).
    - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value) and benzo(a)pyrene.
    - Pesticides/Herbicides, PCBs, and VOCs: none.
- Debris Pile B - Surface Soil (Table 6-2):
    - Metals: arsenic, chromium, and manganese.
    - Explosives/Propellants: 2,4,6-trinitrolouene (qualified as a J value - estimated).
    - SVOCs: 2-methyl-4,6-dinitro.phenol (qualified as a UJ value); bis(2-chloroethyl) ether; benzo(a)pyrene; and hexachloro-cyclopentadiene.
    - PCBs: Aroclor 1254 value was 0.21 mg/kg and screening value is 0.21 mg/kg).
    - Pesticides/Herbicides and VOCs: none.
- Debris Pile C - Surface Soil (Table 6-3):
    - Metals: arsenic, chromium, manganese, and nickel.
    - Explosives/Propellants: none.
    - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value); benz(a)anthracene; benzo(a)pyrene; bis(2-chloroethyl)ether; and hexachlorocyclopentadiene.
    - Pesticides/Herbicides, PCBs, and VOCs: none

- Debris Pile C - Subsurface Soil (Table 6-4):
    - Metals: cadmium and manganese.
    - Explosives/Propellants: none.
    - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value); benz(a)anthracene; benzo(a)pyrene; benzo(b)fluoroanthene; bis (2-chloroethyl)ether; dibenz(a,h) anthracene; N-nitroso-di-n-propylamine; and hexachloro-cyclopentadiene.
    - PCBs: Aroclor 1254.
    - Pesticides/Herbicides and VOCs: none.

Because asbestos and chemical contamination were found in Debris Piles A, B, and C, additional remedial action is warranted. Based on the results of this SI, the AOC should proceed to an RI for further investigation. Additionally, it is recommended that the RI include an additional investigation of the area between Debris Piles A and B and the road adjacent to the east side of the northern-most pond.

1.0 PROJECT DESCRIPTION

1.1 Introduction

This Site Inspection (SI) documents the environmental investigation and results conducted at the former Ravenna Army Ammunition Plant (RVAAP) in Portage and Trumbull counties, Ohio at Compliance Restoration (CR) Site CC (Army Environmental Compliance-Related Cleanup Program) RVAAP-78 Quarry Pond Surface Dump Area of Concern (AOC). The work for this SI was conducted under the U.S. Department of Defense (DOD) Installation Restoration Program (IRP). Prudent Technologies was contracted by the United States Army Corps of Engineers (USACE), Louisville District to complete this SI under Contract No. W912QR-10-P-0052. The original document entitled "Draft Site Inspection (*Phase I Remedial Investigation) Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump, Ravenna Army Ammunition Plant, Ravenna, Ohio*" was submitted to the Ohio EPA on July 16, 2012. Due to delays in the overall cleanup program and contractual issues at the former RVAAP that were unrelated to Prudent's performance, Prudent Technology could not complete and revise this document before the Contract ended. Therefore, USACE has revised and completed this document. Previous versions are withdrawn and replaced by this Final Revised SI.

Planning and performance of all elements of this contract are in accordance with the requirements of the *Ohio Environmental Protection Agency (Ohio EPA) Director's Final Findings and Orders (DFFO) for RVAAP*, dated June 10, 2004 (Ohio EPA, 2004). The DFFO requires conformance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Contingency Plan (NCP) to complete the SI for AOC CC RVAAP-78.

1.2 Purpose and Scope

Environmental work at the former Ravenna Army Ammunition Plant began under the Installation Restoration Program in 1989. Currently, there are 67 Areas of Concern (AOC) and 17 Munitions Response Sites (MRS) located throughout CRJMTC. These AOC and MRS sites were identified by the investigation of historical activities which resulted in the identification of contamination at some sites. Historical activities from former load, assemble, and pack activities related to the Ravenna Army Ammunition Plant and associated support operations are the source of the contamination at the installation. The CC RVAAP-78 Quarry Pond Surface Dump is one of the AOCs moving through the CERCLA cleanup process and is discussed herein (Figure 1-2). Due to the AOC's proximity to the Fuze and Booster Quarry Munitions Response Site, anomaly avoidance procedures were taken as a precaution for the potential of encountering Munitions and Explosives of Concern (MEC).

This SI conducted included a comprehensive background historical review and an initial intrusive investigation to confirm the presence or absence of contamination. The background historical review was to follow the guidance and requirements of a CERCLA Abbreviated Preliminary Assessment (APA), US EPA Improving Site Assessment: Abbreviated Preliminary Assessments, October 1999. The background historical review that was presented in the *Final Historical Records Review Report for 2010 Preliminary Assessment Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump & CC-RVAAP-80 Group 2 Propellant Can Tops, Prudent,*

dated April 2011, identified the historic uses and potential environmental concerns at this site. A brief description and history of CC RVAAP-78 is provided in Section 2.0.

1.3 General Facility Description

The former Ravenna Army Ammunition Plant (RVAAP), now known as the Camp Ravenna Joint Military Training Center (Camp Ravenna), located in northeastern Ohio within Portage and Trumbull counties, is approximately three (3) miles east/northeast of the City of Ravenna and one (1) mile north/northwest of the City of Newton Falls. The facility is approximately 11 miles long and 3.5 miles wide. The facility is bounded by State Route 5, the Michael J. Kirwan Reservoir, and the CSX System Railroad to the south; Garret, McCormick, and Berry Roads to the west; the Norfolk Southern Railroad to the north; and State Route 534 to the east. In addition, the facility is surrounded by the communities of Windham, Garrettsville, Charlestown, and Wayland.

Administrative accountability for the entire 21,683-acre facility has been transferred to the United States Property and Fiscal Officer (USP&FO) for Ohio and the property subsequently licensed to the OHARNG for use as a military training site, Camp Ravenna. The RVAAP restoration program involves cleanup of former production/operational areas throughout the facility related to former activities conducted under the RVAAP.

1.4 Demography and Land Use

The facility consists of 21,683 acres in northeastern Ohio, approximately 37 km (23 miles) east-northeast of Akron and 30 miles (48.3 km) west-northwest of Youngstown. The facility occupies east-central Portage County and southwestern Trumbull County. The 2010 United States Census Bureau reports that the populations of Portage and Trumbull counties are 161,419 and 210,312, respectively. Population centers closest to the facility are Ravenna, with a population of 11,724, and Newton Falls, with a population of 4,795.

The facility is located in a rural area and is not close to any major industrial or developed areas. Approximately 55 percent of Portage County, in which the majority of the facility is located, consists of either woodland or farmland acreage. The closest major recreational area, the Michael J. Kirwan Reservoir (also known as West Branch Reservoir), is south of the facility.

The OHARNG uses the former RVAAP as a military training facility. As the cleanup is completed, the sites are utilized by the OHARNG for various training purposes and missions. The vision of the OHARNG is for Camp Ravenna to serve a premier training center for Pre-Mobilization, Inactive Duty Training and Annual Training events and to be a training facility that provides a world-class range complex, maneuver training areas, and training support facilities which meet unit readiness requirements.

This page intentionally left blank.

1.5 FACILITY ENVIRONMENTAL SETTING

This section describes the physical features, topography, geology, hydrogeology, and environmental characteristics of the facility. The environmental setting specific to this AOC is included in Section 6.

1.5.1 Physiographic Setting

The facility is located within the Southern New York Section of the Appalachian Plateaus physiographic province (United States Geological Survey 1968). This province is characterized by elevated uplands underlain primarily by Mississippian and Pennsylvanian-age bedrock units that are horizontal or gently dipping. The province is characterized by rolling topography with incised streams having dendritic drainage patterns. The Southern New York Section has been modified by glaciation, which rounded ridges, filled major valleys, and blanketed many areas with glacially-derived unconsolidated deposits (e.g., sand, gravel, and finer-grained outwash deposits). As a result of glacial activity, old stream drainage patterns were disrupted in many locales, and extensive wetland areas developed.

1.5.2 Surface Features and Topography

The topography is gently undulating with an overall decrease in ground elevation from a topographic high of approximately 1,220 feet (ft) (372 meters [m]) above mean sea level in the far western portion of the facility to low areas at approximately 930 ft (283 m) above mean sea level in the far eastern portion of the facility.

The facility topography was mapped by USACE in February 1998 using a 2-ft (60.1-centimeter [cm]) contour interval with an accuracy of 0.02 ft (0.61 centimeters [cm]). The USACE based the topographic information on aerial photographs taken during spring 1997. This survey is the basis for the topographical information illustrated in figures included in this SI.

1.5.3 Soil and Geology

1.5.3.1 Regional Geology

The regional geology the facility consists of horizontal to gently dipping bedrock strata of Mississippian and Pennsylvanian-age overlain by unconsolidated glacial deposits of varying thicknesses. The local bedrock and unconsolidated surficial deposits are described in the following subsections.

1.5.3.2 Soil and Glacial Deposits

Bedrock at the facility is overlain by surficial deposits of Wisconsin-age Lavery Till in the western portion of the facility and the younger Hiram Till and associated outwash deposits in the eastern two-thirds of the facility. Unconsolidated glacial deposits vary considerably in thickness across the facility, from nonexistent in some of the eastern portions of the facility to an estimated 150 ft (46 m) in the south-central portion.

Thin surface glacial deposits have been completely removed as a consequence of human activities at locations such as Ramsdell Quarry. Bedrock is present at or near the ground surface in locations such as at Load Line 1 and the Erie Burning Grounds (USACE, 2001).

Where surficial glacial sediments remain, their distribution and character indicate their origin as ground moraine. These tills consist of laterally discontinuous assemblages of yellow-brown, brown, and gray silty clays to clayey silts, with sand and rock fragments. Lacustrine sediment from bodies of glacial-age standing water has also been encountered in the form of deposits of uniform light gray silt greater than 50 ft (15 m) thick in some areas (USACE, 2001).

Soil at the former RVAAP is generally derived from the Wisconsin-age silty clay glacial till. Distributions of soil types are discussed and mapped in the *Soil Survey of Portage County, Ohio*, which describes soil as nearly level to gently sloping and poor to moderately well drained (United States Department of Agriculture [USDA], 1978). Much of the native soil at the facility was disturbed during construction activities in former production and operational areas of the facility. The soil classification types (USDA, 2010) present ad described in Table 1-1.

1.5.3.3 Bedrock Geology

The Sharon Sandstone Member (informally referred to as the Sharon Conglomerate) of the Pennsylvanian Pottsville Formation is the primary bedrock beneath the former RVAAP. The Sharon Sandstone Member, the lowest unit of the Pottsville Formation, is a highly porous, loosely cemented, permeable, cross-bedded, frequently fractured and weathered, orthoquartzite sandstone, which is locally conglomeratic. Thin shale lenses occur in the upper portion of the unit (Winslow and White, 1966).

In the western portion of the facility, the upper members of the Pottsville Formation, including the Sharon Shale, Connoquenessing Sandstone (also known as the Massillon Sandstone), Mercer Shale, and uppermost Homewood Sandstone, have been observed. The regional dip of the Pottsville Formation, as measured in the west portion of the facility is between 1.5 and 3.5 m per 1.6 km (5 and 11.5 ft per mile) to the south.

The Sharon Shale is a gray to black sandy to micaceous shale containing thin coal, underclay, and sandstone lenses. The Mercer Member of the Pottsville Formation consists of silty to carbonaceous shale with abundant thin, discontinuous sandstone lenses in the upper portion. Regionally, the Mercer also has been noted to contain interbeds of coal.

The Homewood Sandstone Member is the uppermost unit of the Pottsville Formation. It typically occurs as a caprock on bedrock highs in the subsurface, and ranges from well-sorted, coarse-grained, white quartzose sandstone to a tan, poorly sorted, clay-bonded, micaceous, medium- to fine-grained sandstone. Thin shale layers are prevalent in the Homewood Member as indicated by a darker gray shade of color.

Table 1-1. Types of soils found at the former RVAAP.

USDA Soil Series Classification	Parent Material	Geographic Setting	Slope %	Drainage	Surface Runoff	Permeability
Frenchtown silt loams (Fr)	Formed in loam glacial till	On undulating till plain and in long, narrow areas along drainage ways	Level	Poorly drained	Slow	Slow
Holly silt loams (Ho)	Formed in recent alluvium	On narrow flood plains and strips on large flood plains	Level	Poorly drained	Slow	Moderate to moderately slow
Mahoning silt loams (MgA)	Formed in silty clay loam or clay loam glacial till	In upland areas between drainage ways	0-2	Poorly drained	Slow	Slow
Mahoning silt loams (MgB)	Formed in silty clay loam or clay loam glacial till	In slightly convex upland areas	2-6	Poorly drained	Medium to rapid	Slow
Mahoning-Urban land complex (MnB)	Formed in silty clay loam or clay loam glacial till	In urban or industrialized areas	Undulating	Varies	Varies	Varies
Mitiwanga silt loam (MtB)	Formed in glacial till 20-40 inches thick overlaying sandstone bedrock	On uplands, commonly at a slightly higher elevation than surrounding soils	2-6	Poorly drained	Medium	Moderate
Trumbull silt loam (TrA)	Formed in silty clay loam, clay loam, or silty clay glacial till	Along small drainage ways or in small depressions adjacent to the better-drained Mahoning and Remsen soils	0-2	Poorly drained	Slow	Very slow
Udorthents (Ud)	Subsoil or substratum of adjacent soils	In areas that have been cut or filled	0-10	Varies	Varies	Varies
Wadsworth silt loams (WaA)	Formed in silty clay loam and silt loam glacial till	On broad upland flats	0-2	Poorly drained	Slow	Slow
Wadsworth silt loams (WaB)	Formed in silty clay loam and silt loam glacial till	Near the heads of drainage ways and on long gentle upland slopes	2-6	Poorly drained	Moderate	Slow

Note:
USDA = United States Department of Agriculture.

1.5.4 Hydrogeology

1.5.4.1 Regional Hydrogeology

Sand and gravel aquifers are present in the buried-valley and outwash deposits in Portage County, as described in the *Phase I Remedial Investigation Report for High Priority Areas of Concern at the Ravenna Army Ammunition Plant, Ravenna, Ohio* (USACE, 1998). Generally, these saturated

zones are too thin and localized to provide large quantities of water for industrial or public water supplies; however, yields are sufficient for residential water supplies. Lateral extent and continuity of these aquifers are unknown. Recharge of these units is derived from surface water infiltration of precipitation and surface streams. Specific groundwater recharge and discharge areas have not been delineated. The regional potentiometric surface at the former RVAAP for unconsolidated surficial deposits and minor bedrock aquifers are presented in Environmental Quality Management [EQM] 2014.

The thickness of the unconsolidated surficial deposits at the former RVAAP ranges from thin to absent in the eastern and northeastern portion of the facility to an estimated 150 ft (46 m) in the central portion. The water table is encountered within the unconsolidated zone in many areas of the former RVAAP. Because of the heterogeneous nature of the surficial deposits, groundwater flow patterns are difficult to determine. Aquifer recharge from precipitation likely occurs via infiltration along root zones, desiccation cracks, and partings within the soil column. Laterally, local groundwater flow directions likely follow topographic contours and stream drainage patterns, with preferential flow along pathways (e.g., sand seams, channel deposits, or other stratigraphic discontinuities) having higher permeabilities than surrounding clay or silt-rich material. Aquifer recharge from precipitation likely occurs via infiltration along root zones, desiccation cracks, and partings within the soil column.

Beneath the facility, the principal bedrock aquifer is the Sharon Conglomerate (EQM, 2014). Depending on overburden thickness, the Sharon Conglomerate bedrock aquifer ranges from an unconfined to a leaky artesian aquifer hydraulically. According to one source, well yields from onsite supply wells completed in the Sharon Conglomerate range from 30 to 400 gallons per minute (United States Army Toxic and Hazardous Materials Agency 1978). Yields of 5 -200 gallons per minute have also been reported for onsite bedrock wells completed in the Sharon Conglomerate (Kammer, 1982).

Other local bedrock aquifers include the Homewood Sandstone, which is generally thinner and only capable of well yields less than 10 gallons per minute, and the Connoquenessing Sandstone. Wells completed in the Connoquenessing Sandstone in Portage County yield from 5 to 100 gallons per minute, but are typically less productive than the Sharon Conglomerate due to a lower formation permeability.

In general, the hydraulic gradient in the Sharon Conglomerate bedrock aquifer results in a regional eastward flow of groundwater that appears to be more uniform than flow directions in the unconsolidated surficial deposits because local surface topography influences the latter. Due to the lack of well data in the western portion of RVAAP, general flow patterns are difficult to discern. For much of the eastern half of the facility, hydraulic head elevations in bedrock are higher than those in overlying unconsolidated deposits, indicating an upward vertical hydraulic gradient. These data indicate there is a confining layer separating the two aquifers in some areas. In the far eastern area, there is little difference in the hydraulic head elevations, suggesting a hydraulic connection exists between the two aquifers.

1.5.4.2 Groundwater Usage and Domestic Water Supply

The former RVAAP historically used groundwater for both domestic and industrial supplies. Groundwater utilized at the former RVAAP during past operations was obtained from production wells located throughout the former RVAAP, with most wells screened in the Sharon Conglomerate. The Army discontinued use of most of the groundwater production wells prior to 1993, when the facility was placed in modified caretaker status. Currently, one of the four original groundwater production wells remains in use by the OHARNG. This well, located in the former Administration Area, is not used as a potable water source, but supplies non-potable water for sanitary purposes for active use buildings on the facility.

In addition, as of 2011, the OHARNG has installed two bedrock aquifer production wells at the facility. These two OHARNG supply wells were completed in the Sharon Conglomerate near Buildings 1067 and 1068 within the former Administration Area.

The closest population center to the facility, the City of Newton Falls, obtains municipal water supplies from the east branch of the Mahoning River. Currently, most groundwater use in the area surrounding the facility is for domestic and livestock supply, with the Sharon Conglomerate acting as the major producing aquifer in the area. The Connoquenessing Sandstone Member and Homewood Sandstone Member also provide limited groundwater supplies, primarily to the western half of the facility. Unconsolidated deposits can also be an important source of groundwater. Many of the domestic wells and small public water supplies located near the facility obtain sustainable quantities of water from wells completed in unconsolidated, surficial deposits.

In the unconsolidated aquifer, groundwater flows predominantly eastward; however, the unconsolidated zone shows numerous local flow variations influenced by topography and drainage patterns. The local variations in flow direction suggest the following: (1) groundwater in the unconsolidated deposits is generally in direct hydraulic communication with surface water, and (2) surface water drainage ways may also act as groundwater discharge locations. In addition, topographic ridges between surface water drainage features act as groundwater divides in the unconsolidated deposits.

Local groundwater within and surrounding the facility contains proportionately high levels of iron, manganese, and naturally occurring carbonate compounds. As such, it is classified as "hard" water. Hard water has an associated metallic taste that can be unpalatable if not properly treated for human consumption (OHARNG, 2008).

1.5.4.3 Regional Surface Water

The facility resides within the Mahoning River watershed, which is part of the Ohio River basin. The west branch of the Mahoning River is the main surface stream in the area. The west branch flows adjacent to the west end of the facility, generally north to south, before flowing into the Michael J. Kirwan Reservoir south of State Route 5. The west branch flows out of the reservoir and parallels the southern facility boundary before joining the Mahoning River east of the facility.

The western and northern portions of the facility display low hills and a dendritic surface drainage pattern. The eastern and southern portions are characterized by an undulating to moderately level

surface, with less dissection of the surface drainage. The facility is marked with marshy areas and flowing and intermittent streams whose headwaters are located in the upland areas of the facility.

The three primary watercourses that drain the facility are as follows:

- South fork of Eagle Creek
- Sand Creek
- Hinkley Creek.

All of these watercourses have many associated tributaries. Sand Creek, with a drainage area of 13.9 square miles (36 square km), flows generally in a northeast direction to its confluence with the south fork of Eagle Creek. In turn, the south fork of Eagle Creek continues in a northerly direction for 2.7 miles (4.3 km) to its confluence with Eagle Creek. The drainage area of the south fork of Eagle Creek is 26.2 square miles (67.8 square km), including the area drained by Sand Creek. Hinkley Creek originates just southeast of the intersection between State Route 88 and State Route 303 to the north of the facility. Hinkley Creek, with a drainage area of 11.0 square miles (28.5 square km), flows in a southerly direction through the facility, and converges with the west branch of the Mahoning River south of the facility (USACE, 2001).

Wetland areas at the facility include seasonal wetlands, wet fields, and forested wetlands. Many of the wetland areas are the result of natural drainage or beaver activity; however, some wetland areas are associated with anthropogenic settling ponds and drainage areas. Previous jurisdictional wetland delineations have surveyed approximately 5,680 acres or 26 percent of the Camp Ravenna land. Approximately 715 acres of jurisdictional wetlands have been delineated within the 5,680 acres, which comprises approximately 13 percent of the total area that was surveyed.

Approximately 282 acres of ponds are found on the facility. Many were constructed within natural drainage ways to function as settling ponds or basins for process effluent and runoff. Others are natural in origin, resulting from glacial action or beaver activity. Water bodies at the facility support aquatic vegetation and biota. Stormwater runoff is controlled primarily by natural drainage, except in former operations areas where an extensive storm sewer network helps to direct runoff to drainage ditches and settling ponds. Additionally, the storm sewer system was one of the primary drainage mechanisms for process effluent during the period that former production facilities were in operation.

1.5.5. Climate

The general climate of the area where the facility is located is continental and characterized by moderately warm and humid summers, reasonably cold and cloudy winters, and wide variations in precipitation from year to year. Climate data for the facility, presented below, were obtained from available National Weather Service records for the 30-year period of record from 1981 to 2010 at the Youngstown Regional Airport, in Youngstown, Ohio and were obtained from:*(http://www.nws.noaa.gov/climate/xmacis.php?wfo=cle*). Wind speed data for Youngstown, Ohio, are from the National Climatic Data Center *(http://www.ncdc.noaa.gov/data-access/quick-links#wind*) for the available 66-year period of record from 1930 through 1996.

Average annual rainfall in the area is 38.86 inches (98.7 cm), with the highest monthly average occurring in July (4.31 inches [10.9 cm]) and the lowest monthly average occurring in February

(2.15 inches [5.46 cm]). Average annual snowfall totals approximately 63.4 inches (161.0 cm) with the highest monthly average occurring in January (17.1 inches [43.43 cm]). Due to the influence of lake-effect snowfall events associated with Lake Erie, located approximately 35 miles (56.3 km) northwest of the facility, snowfall totals vary widely throughout northeastern Ohio.

The average annual daily temperature in the area is 49.3 degrees Fahrenheit (ºF), with an average daily high temperature of 59.0 ºF and an average daily low temperature of 39.7 ºF. The record high temperature of 100 ºF occurred in July 1988, and the record low temperature of -22 ºF occurred in January 1994. The prevailing wind direction at the facility is from the west-southwest, with the highest average wind speed occurring in January (12 miles [19.3 km] per hour) and the lowest average wind speed occurring in August (7 miles [11.3 km] per hour). As per the National Climatic Data Center, 20 storm events (category Thunderstorm Wind) were reported between January 1, 1996 and July 31, 2013 *(http://tinyurl.com/k2kn47o).* The area is susceptible to tornadoes; minor structural damage to several buildings on the facility property occurred as the result of a tornado in 1985.

1.6 REPORT ORGANIZATION

This SI report is organized into the following sections:

- Chapter 1 (Introduction) - Provides an overview of the purpose and scope of this SI, a general description, and the demography and land use of the facility. This section also provides an overview of the environmental setting at the facility.
- Chapter 2 (Site Description and Operational History) - Provides the site description and land use history of CC RVAAP-78. The physical property characteristics, chronological history of the property, military operations, and summary of the past investigations are included.
- Chapter 3 (Historical Operations) - Summarizes the historical operations, investigations, and removal actions at CC RVAAP-78
- Chapter 4 (Field Investigation) - Addresses the scope of activities performed under this SI. This section discusses sampling rationale for placement of environmental media sampling locations, field activity procedures, laboratory methods, and protocols. Included in this section are the pre-mobilization activities and the field sampling methodologies for the subsurface soil sampling. Deviations from the work plan are outlined in this section. Site surveying and the collection and characterization of the investigation-derived wastes (IDW) generated during this SI are discussed.
- Chapter 5 (Data Evaluation and Summary of Analytical Results) - Provides the data evaluation process used for this SI, a summary of subsurface soil sampling results, and a presentation of the comparison of the screening criteria to identify the presence of potential contamination. The results of the weight-of-evidence (WOE) evaluation are provided in this chapter, as well as a discussion of the IDW characterization results.
- Chapter 6 (Exposure Pathways) - Summarizes physical conditions, and hydrological and hydrogeological settings and provides conclusions for the exposure pathways identified for soil, air, surface water, and groundwater.
- Chapter 7 (Summary and Conclusions) - Summarizes findings and conclusions of this SI.

- Chapter 8 (References) - Lists references used for this report.

The SI includes the discussion and consideration of the following components:

- Site descriptions and operational histories
- Waste characteristics and management practices
- Summary of field investigation and pre-mobilization activities
- Known and suspected hazardous, toxic or radioactive waste (HTRW) and MEC issues
- Exposure pathways evaluation for surface soil, subsurface soil, air, surface water, and groundwater.
- Human population and environmental targets
- Analytical data and results
- Comparison of results with the appropriate screening criteria such as Facility-wide Cleanup Goals (FWCUGs) and/or the US Environmental Protection Agency's (EPA) Regional Screening Levels (RSLs)
- Data Verification Report
- Conclusions
- References

Report appendixes contain summarized investigation data as follows:

- Appendix A – CC RVAAP-78 Historical Aerial Photographs
- Appendix B – Tailgate Health & Safety Meeting Logs
- Appendix C – Activity Field Logs
- Appendix D – Daily QC Reports
- Appendix E – Field Boring Logs
- Appendix F – Typed Field Boring Logs
- Appendix G – Data Verification Report
- Appendix H – Laboratory Data
- Appendix I – Data Validation Report
- Appendix J – Drum Removal Documentation
- Appendix K – Fuze and Booster GW Data
- Appendix L – Automated Data Review Report
- Appendix M – Chemical Results for ISM Soil Samples for the Burn Area, Debris Piles A, B, and C
- Appendix N – Ohio EPA's Comments and Army's Responses

2.0 SITE DESCRIPTION

The description and operational history of CC RVAAP-78 was obtained through a variety of sources including, interviews of former personnel, review of historical aerial photographs, construction drawings, and reports obtained from the RVAAP restoration program and the OHARNG repositories.

The Quarry Pond Surface Dump AOC is located in the southwestern portion of the facility, just north of the Fuze and Booster Quarry (FBQ) Landfill/Ponds AOC (RVAAP-16), north of Fuze and Booster Road. The site consists of three areas of former dumping shown on Figures 2-1 and 2-2.

Two of the dumping areas at CC RVAAP-78, Debris Piles A and B, are at the bases of steeply inclined rock slopes of the quarry. The third area of dumping at CC RVAAP-78, Debris Pile C, is more flat and is adjacent to the northwest end of the northern-most pond within the RVAAP-16 AOC.

Debris Pile A is approximately 425 feet in length varying in surface width from 18 to 68 feet. Debris Pile A consists of construction debris, scrap metal, cultural debris, and asbestos containing materials (e.g. transite type roofing, sheeting, etc.). A second, smaller debris pile at the base of a steeply inclined rock slope, defined as Debris Pile B, is approximately 296 feet in length and 24 feet wide.

A small area where materials appeared to have been burned is located near a rusted, 55-gallon drum (Drum #1) (which was removed and disposed as part of this SI) and within Debris Pile B. This area was called an "apparent burn area" in this SI although there is no evidence besides charred ground and lack of vegetation to support that it was used as an actual burn area. The topographic map of this area (see Figure 2-2), shows the south end of Debris Pile A becoming one continuous slope from Reference Point 9b of Debris Pile A to Reference Point 3 of Debris Pile B (see Figure 2-1). Debris Pile C is located along the northwestern corner of the northern-most quarry pond area with the debris area being approximately 120 feet by 45 feet. A second rusted 55-gallon drum (Drum #2) was present within this area but was removed and properly disposed as part of this SI.

Table 2-1 provides the Global Positioning System (GPS) Ohio State Plane coordinates of locations where observations were made during the site reconnaissance, monitoring wells and 55-gallon drums. Reference numbers listed on Table 2-1 correspond to Figures 2-1 and 2-2.

Table 2-1. Latitude/Longitude from the reconnaissance at CC RVAAP-78.

Reference #	Latitude	Longitude	Findings
CC-78 GPS Points			
1	41.1796	-81.1128	Apparent burn area devoid of vegetation
2	41.1794	-80.1128	Miscellaneous debris
3	41.1792	-81.1128	Concrete rubble
4	41.1797	-81.1129	Mounded material
5a	41.1797	-81.1137	Southwestern corner of Debris Pile C
5b	41.1798	-81.1134	Debris and corrugated metal
6	41.1799	-81.1131	Corrugated metal and roofing material
7a	41.1801	-81.1129	Bricks and end of construction debris
7b	41.1801	-81.1123	Small mound of bricks with vegetation
8	41.1801	-81.1124	Vegetation and fill material
9a	41.1800	-81.1124	Tie Bar
9b	41.1795	-81.1126	Construction debris
10	41.1797	-81.1121	Railroad ties
55-Gallon Drum			**Findings**
55-Gallon Drum 1	41.1796	-81.1136	Perforated, solidified drum
55-Gallon Drum 2	41.1796	-81.1128	Disintegrated remnants of a drum

3.0 OPERATIONAL HISTORY

The FBQ was used as a burning area for explosive contaminated sawdust for Load Lines 6 and 11 from 1945-1949 (SAIC, 1996). Additionally, historical operational information indicated fuze and booster assemblies, projectiles, residual ash, and sanitary wastes were burned or dumped in the quarry prior to pond construction. In 1976, three settling ponds were constructed, separated by two earthen dams, with flow control gates for treating the spent brine regenerant and sand filtration backwash water from the Water Works 3 treatment plant that treated groundwater from facility production wells (1976-1993). As the three settling ponds were being constructed, debris was removed from the quarry bottom and transferred to the Ramsdell Quarry Landfill or one of the other burning grounds. In 1998, the RVAAP-16 AOC was expanded to include the quarry vicinity, the 11 former settling ponds/depressions and drainage conveyances, and a debris pile north of the quarry. Following the investigation and remediation of the FBQ, three debris piles were encountered within this area which required additional consideration. These three debris pile constitute the Quarry Pond Surface Dump, CC RVAAP-78, which is initially being handled by this site inspection.

Aerial photographs from 1951 and 1952 show CC RVAAP-78 being used as a dump, Table 3-1 and (Appendix A, Figures 1 and 2). Aerial photographs from 1966, 1979, and 1981 show less vegetation in the area northeast of the northern-most pond than what was observed during the site reconnaissance (Appendix A, Figures 3-5). The obscurity of these images is a result of the limited historical aerial photograph available for the area.

The Quarry Pond Surface Dump AOC CC RVAAP-78 is located in the southwestern portion of the facility, just north of RVAAP-16, north of Fuze and Booster Road. The site consists of three areas of former dumping shown on Figures 2-1 and 2-2. Two of the former dumping areas, Debris Piles A and B, are at the base of steeply inclined rock slopes. The third area of dumping, Debris Pile C, is more flat and is adjacent to the northwest end of the northern-most pond within the RVAAP-16 AOC. The FBQ was used as a burning area for explosive contaminated sawdust for Load Lines 6 and 11 from 1945-1949 (Science Applications International Corporation [SAIC], 1996). Additionally, historical operational information indicated fuze and booster assemblies, projectiles, residual ash, and sanitary wastes were burned or dumped in the quarry prior to pond construction (USATHAMA, 1978).

In 1976, three settling ponds were constructed, separated by two earthen dams, with flow control gates for treating the spent brine regenerant and sand filtration backwash water from the Water Works 3 Treatment Plant that treated groundwater from facility production wells (1976–1993). As the three settling ponds were being constructed, debris was removed from the quarry bottom and transferred to the Ramsdell Quarry Landfill or one of the other burning grounds. In 1998, following receipt of the detailed 1951 set of aerial photographs, many possible additional environmental sites were field checked by USACE and limited sampling at a few of the sites was performed. As a result, the list of environmental sites (AOCs) was increased from 32 to 51. In addition to the newly added sites, several of the existing 32 AOCs were modified. The set of small lagoons and several debris piles noted adjacent to the Fuze and Booster Quarry ponds were added to RVAAP-16 (USACHPPM, 1998). Following investigation and remediation of the Fuze and Booster Quarry Landfill/Ponds, three debris piles were encountered within this area which required

additional consideration. These three debris piles constitute the Quarry Pond Surface Dump, CC RVAAP-78, which is initially being assessed in this SI.

Land disturbance, potential grading, surface debris and what may have been heavy equipment are visible in aerial photographs from 1951 and 1952. The presence of such activity and equipment support that CC RVAAP-78 was being used as a dumping area (Table 3-1 and (Appendix A, Figures 1 and 2). Aerial photographs from 1966, 1979, and 1981 show less vegetation in the area northeast of the northern-most pond. Less vegetation was observed during the site reconnaissance conducted on November 11, 2010 (Appendix A, Figures 3 -5). The obscurity of these images is a result of the limited historical aerial photograph available for the area.

Debris Pile A contains transite, roofing material, debris from construction, scrap metal, and unidentified materials. Debris Pile B includes similar materials and an apparent burn area and also previously contained a rusted 55-gallon drum, Drum #1 that was removed as part of this SI. The apparent burn area is characterized by its charred ground and lack of vegetation. Because the depth to rock immediately adjacent to these piles is generally less than 1.0-ft, only surface soil ISM sampling was done and such sampling was done immediately adjacent to the piles, not through them to avoid disturbing transite, which was suspected of containing asbestos.

Debris Pile C is situated at the northwest end of the northern-most pond and is relatively flat. Miscellaneous fill is present, however, no transite materials were observed in this area. Because the depth to rock is approximately 5 feet, both surface soil and subsurface soil ISM sampling was conducted in Debris Pile C. A second rusted 55-gallon drum, Drum #2 was present within this area before it was removed.

It is possible that construction debris and/or material excavated from the quarry is present in the area between Debris Piles A and B and in the area extending from the west side of Debris Pile B over the east side of the northern-most pond. This is based on:

- The colors of the soils in the borings in this area differ in colors from the soils in borings from adjacent undisturbed areas.
- The piles of bricks and other items located away from the base of the steeply inclined rock slopes (noted during site reconnaissance), along with the lack of large vegetation in this area between the 1970's and 1980's (Appendix A, Figures 4-6) suggests additional minor amounts of fill, probably from trucks, may have been dumped in this area before the trees grew large enough to block truck passage. The obscurity of these images is a result of the limited historical aerial photograph available for the area.
- Aerial photographs from 1952 show vehicle activity and debris piles within and adjacent to the quarry (Appendix A, Figure 2).

Interviews with former employees indicate that construction debris from building maintenance was disposed of at the quarry prior to construction of the three dams. The observations stated earlier are based on information gained during the site reconnaissance and the aerial photographs of the late 1970's, 1980's, 1951, and 1952.

Table 3-1. Summary of observations from aerial photographs from CC RVAAP-78.

Date Flown	Company	Location of Hardcopy	CD Available	Significant Information - CC RVAAP -78 Quarry Pond Surface Dump
5/8/51	Unknown	RTLS	Yes	Appears to be two large areas within the quarry. Appears to be fence or tree lines perpendicular to each other northeast of the quarry. Passible West-East and North-South rock slopes that intersect each other northwest of the quarry. Two roads into the quarry, one West-East and one South-North, both pale indicating little or no vegetation and much activity. Much bare area directly west of the quarry.
4/16/52	Unknown	1037	No	Looks like may have be road down the middle of the quarry in approximate N-S alignment. Looks like truck on west side of quarry, just north of the west-east road. Looks like another truck on road at north end. Looks like many individual piles down in the quarry. Limited vegetation northeast of quarry.
7/17/66	Unknown	Bldg.	Yes	Obvious road along east side of quarry, then turns sharply west just north of the north end of the Quarry. Much bare area over north and northeast end of quarry- much less tree cover than now. Looks like one big open quarry, not separated as in 1951.
9/17/79	US Dept. of Agriculture	RTLS	Tif	High altitude photograph - less detai1 than other aerial photographs. Still relatively bare area north and east of quarry. Do not see individual ponds, looks like just one area. West-east road has darker shade and thus looks less used than the south-north road to the quarry.
11/10/81	Aerials Surveys, Inc.	Bldg. 1037 & RTLS	No	See three ponds. North pond has lighter shade- may be more shallow. Appears to be road or line from east extending to the east side of the middle pond and then turning north along the east side of the north pond. More vegetation northeast of north pond, but still not as dense as present.
3/26/85	AMATS*	RTLS	Tif	Three ponds all have similar darkness, although north pond 1Ooks slightly lighter. Area northeast of north pond looks more vegetated than in past, but still less than current.

4.0 FIELD SAMPLING

A work plan (WP), entitled, *Work Plan Addendum for 2010 Preliminary Assessment Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump,* dated October 24, 2011 was prepared for this project. All work conducted for this investigation, including anomaly avoidance, was performed as delineated in this addendum and the Facility-Wide Sampling and Analysis Plan for Environmental Investigations (FWSAP), SAIC, dated February 24, 2011, unless specifically noted.

4.1 Purpose and Scope of Intrusive Investigation

The overall purpose of the Intrusive Investigation of CC RVAAP-78 was to confirm the presence or absence of contamination at the CC RVAAP-78 Quarry Pond Surface Dump site. The scope of the investigation was to:

- Determine if there is contamination in the surface soil immediately adjacent to Debris Piles A and B,
- Determine if there is contamination in the surface soil within the apparent burn area (within Debris Pile B),
- Determine if there is contamination in the surface and subsurface soil within Debris Pile C,
- Quantify the amount of asbestos in small pieces of transite taken from Debris Piles A and B,
- Quantify amount of asbestos in a small piece of roofing found at Debris Pile B (not in the original WP Addendum for this project),
- Characterize the contents for disposal within the two rusted 55-gallon drums (Drum #1 at Debris Piles B and Drum #2 at Debris Pile C),
- Remove and dispose the two rusted 55-gallon drums per the characterization of the drums, and
- Compare levels of contamination detected in surface soils and subsurface soils sampled in this investigation with the sets of Ravenna FWCUGs developed for Ravenna-specific receptors.

The primary objective of this SI was to determine the presence of potential contamination in soil at the AOC as well as assess the asbestos at the AOC. In order to determine potential contamination, the following steps were included as part of this SI:

- Collect samples for laboratory analysis at CC RVAAP-78.

- Identify whether Site-Related Chemicals (SRCs) are present in the soil in the debris piles at the AOC. The SRCs are identified following the process outlined in the Facility-Wide Human Health Cleanup Goals document (SAIC, 2010).

- Compare the maximum reported concentrations of the SRCs to the most stringent Resident Receptor Facility-Wide Cleanup Goals (FWCUGs), between the adult and the child receptor, using the Target Cancer Risk (TCR) level of 10^{-6} and the Target Hazard Quotient (THQ) for non-carcinogenic risks of THQ = 0.1. For the purposes of this SI, potential contamination at CC RVAAP-78 is defined by an exceedance of the most stringent Resident Receptor FWCUG.

- Complete a weight-of-evidence (WOE) approach to further evaluate the SRCs reported at concentrations exceeding the most stringent Resident Receptor FWCUG using the TCR level of 10^{-6} or the THQ for non-carcinogenic risks at THQ = 0.1.

- Provide a recommendation for either further investigation under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) in the form of a Remedial Investigation, if potential contamination has been identified, or NFA if no potential contamination has been identified at this AOC.

4.2 Data Quality Objectives (DQO)

The data quality objectives of the Intrusive Investigation of CC RVAAP-78 were as follows:

- Conduct Incremental Sampling Methodology (ISM) sampling of surface soils at Debris Piles A, B, and C that produce representative and repeatable data,

- Conduct ISM sampling of subsurface soils at Debris Pile C that produce representative and repeatable data. Debris Pile C is the only debris pile that has sufficient soil cover to allow subsurface soil sampling,

- Provide sufficient Quality Control (QC)/Quality Assurance (QA) sampling to evaluate the overall quality of both the field and laboratory sampling procedures,

- Quantify the amount of asbestos in pieces of transite (and roofing) to guide future investigation/removal activities,

- Provide sufficient characterization data for disposal of the two rusted 55-gallon drums according to State of Ohio and Federal regulations,

- Provide sufficient data to verify that the two rusted 55-gallon drums have been disposed of according to State of Ohio and Federal regulations, and

- Provide sufficient analytical data to identify if contamination is present at the AOC using appropriate criteria.

4.3 Activities Prior to Sample Collection

4.3.1 Pre-mobilization

4.3.1.1 Subcontracts

Subcontracts were established with the following companies for services as described below.

Drilling (Geoprobe) Services	Frontz Drilling
Analytical Services for Primary and QC Samples	TestAmerica, Inc.
Analytical Services for QA Samples	CT Laboratories
Surveying Services	Vista Sciences Corporation
Waste Disposal	Emerald Environmental, Inc.
Asbestos Sampling	Diamond Environmental
Disposal of 55-Gallon Drums	SWS Environmental Services

4.3.1.2 Regular Equipment Procurement

Much of the sampling equipment was purchased via the internet, including materials from Forestry Suppliers, Inc. (step probes), En Novative Technologies, Inc. (Terra Cores). Products were shipped directly to Building 1036 during the week prior to the beginning of field sampling. Blank sampling labels were prepared prior to arrival at the site. A photoionization detector owned by Prudent was brought to the site from the San Antonio, Texas Office.

4.3.2 Mobilization

Mobilization took place on November 7 and 8, 2011 and included assembling and organizing all the preordered equipment/materials, purchasing equipment not already ordered, organizing the allocated workspace in Building 1036, establishing the decontamination line, purchasing waste drums, and coordinating with facility personnel and other contractors working on site.

4.3.3 Site Preparation

On November 8, 2011, Prudent personnel, including an Unexploded Ordnance (UXO) Technician, located Debris Piles A, B, C, the apparent burn area, and Drums #1 and #2. The delineation of these areas was made more obvious with the recent falling of foliage from the trees. At Debris Pile C where subsurface ISM sampling was to be performed, Prudent personnel placed yellow pin flags to locate primary Geoprobe boring locations, orange flags for the QC or 2nd triplicate Geoprobe locations, and red flags for the QA or 3rd triplicate Geoprobe boring locations. Some removal of small trees was performed to allow access of the Geoprobe drilling rig. Surface and subsurface MEC avoidance during drilling, was performed during both the selection of individual boring locations and the drilling of individual borings.

4.4 Surface and Subsurface Soil ISM Sampling

Sample information, identification, sample type, and analysis from the Intrusive Investigation of the CC RVAAP-78, along with the dates the sampling was accomplished, is provided on Tables 4-1 and 4-2.

This page intentionally left blank.

Table 4-1. Sample and analysis information for the surface soil/discrete/drum samples collected from CC RVAAP-78 AOC.

All sampling was performed in accordance with the *Final Work Plan Addendum for 2010 Preliminary Assessment Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump* and the *Facility-Wide Sampling Analysis Plan (FWSAP)*, except as noted. The sampling team consisted of personnel from Prudent including John Jent, Tomas Hernandez, Jr., and Amanda Miller.

4.4.1 Subsurface Soil Investigations

Horizontal (1' – 3' and 3' – 5') and vertical (1' – 5') ISM subsurface soil samples were collected from six borings, each taken to five feet below ground surface (bgs) within Debris Pile C to assess contaminant occurrence and distribution in subsurface soil. Because Debris Pile C was the only area where bedrock was deep enough to allow subsurface sampling, the triplicate sets of primary, QC, and QA samples were collected at Debris Pile C. All samples were analyzed for explosives, propellants, SVOCs, VOCs, PCBs, target analyte list (TAL) metals, mercury, pesticides and asbestos. Figure 4-1 shows the soil boring locations for Debris Pile C as well as the approximate locations of the ISM sample locations from Debris Piles A, B, and C.

The subsurface horizontal and vertical ISM samples were taken at Debris Pile C atop an approximately 4-foot high ridge of apparently dumped materials, see Photograph 4-1. The materials within this ridge were extremely heterogeneous, (Photographs 4-2 and 4-3). A photograph of the subsurface soil field sample preparation for VOC analyses is provided as Photograph 4-4. The goal of the subsurface ISM sampling was to determine average levels of contamination within 2-foot horizontal layers (1' – 3' and 3' – 5') within Debris Pile C and average levels from 1' – 5' bgs from each of the borings. Additionally, the subsurface ISM sampling aimed to provide good estimates of the types, locations, and extents of subsurface materials and conditions present.

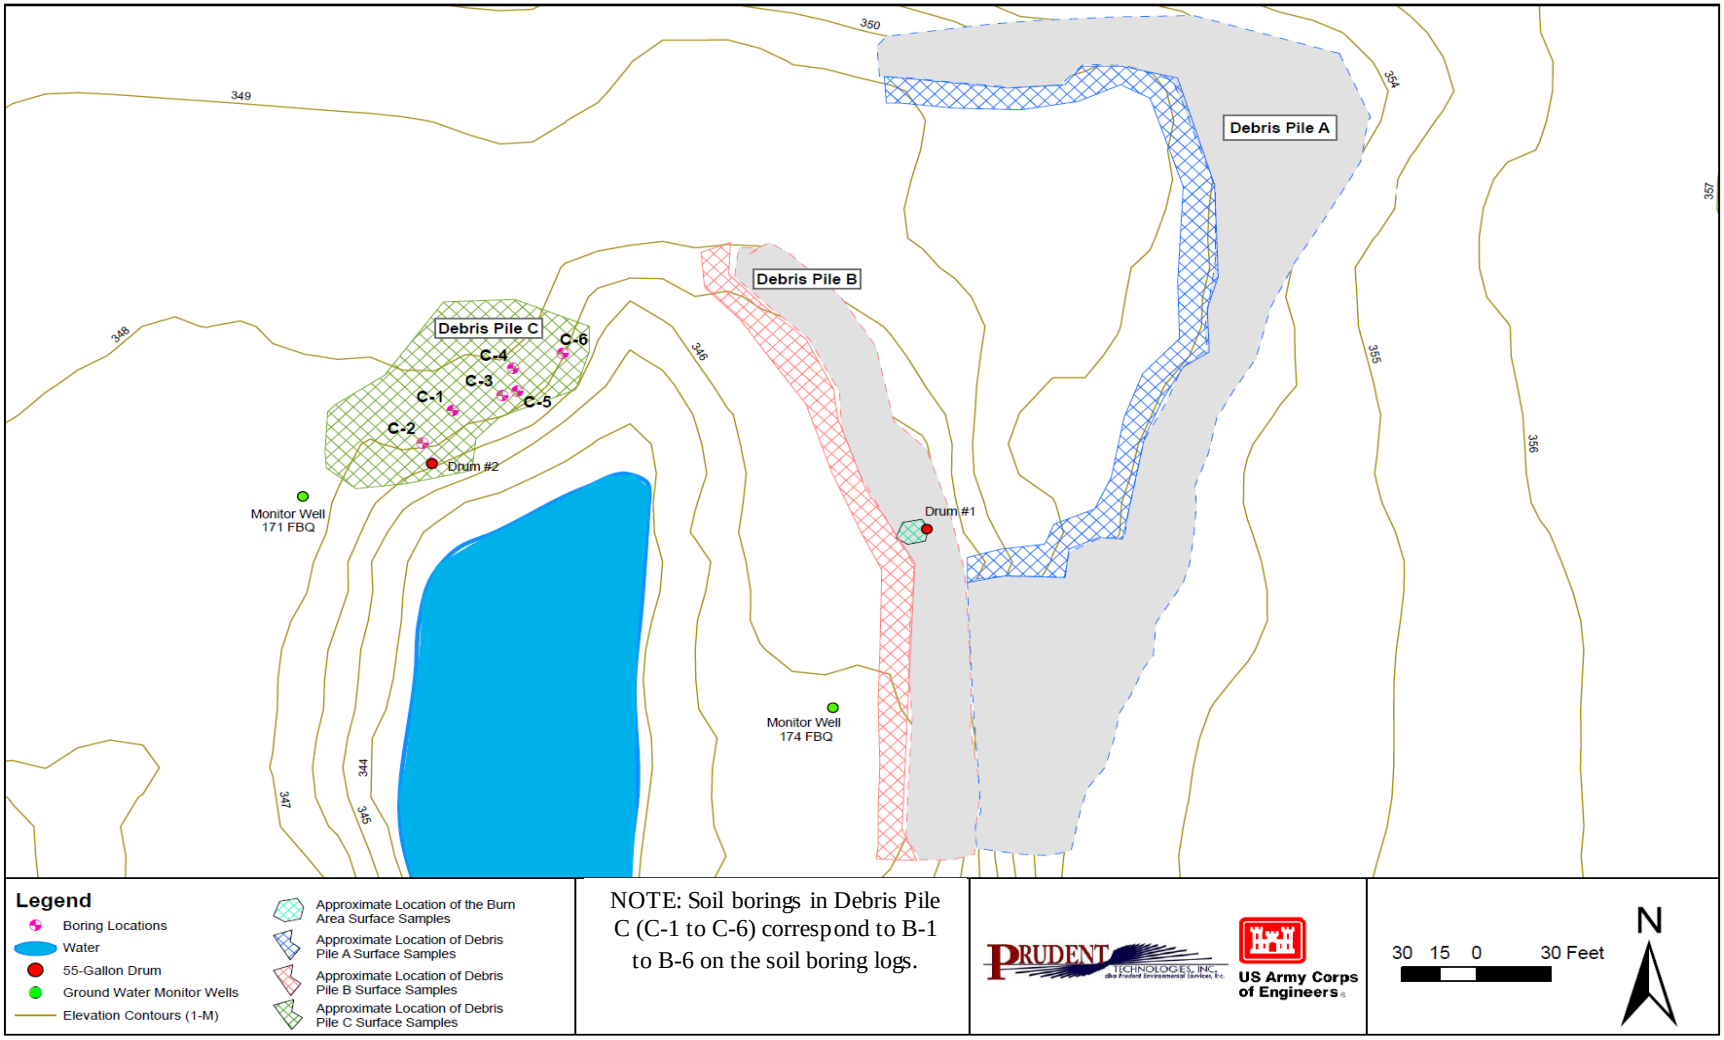
4.4.2 Surface Soil Investigation

The surface soil ISM samples (0 – 1' bgs) were collected adjacent to Debris Piles A and B, from the apparent burn area adjacent to Debris Pile B, and from within Debris Pile C. Additionally two samples of exposed material that was assumed to be transite and a piece of roofing were collected. All such sampling was conducted in accordance with the WP Addendum and the FWSAP, except as noted in this SI. A photograph of the surface soil ISM sampling is provided as Photographs 4-5. Photographs of the burn area and surface soil ISM sampling are provided as Photographs 4-6 and 4-7. The materials logged at the burn area were 0 – 6" of black organic material followed by 6" of gray clay, see Photograph 4-8.

Thirty individual soil samples (aliquots) were collected within each ISM sample area to comprise the ISM sample for that sample area. Such sampling was planned to extend from 0 – 1' bgs, however, rock was encountered in many locations at depths shallower than 1 foot. The objective was to assess average levels of contamination in surface soils adjacent to the Debris Piles A, B, within the apparent burn area, and Debris Pile C. All primary, QC, and QA samples collected at Debris Pile A were analyzed for explosives, propellants, TAL metals, SVOCs, VOCs, pesticides, PCBs, and asbestos, except for the two sets of Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples for which asbestos analysis was not performed.

This page intentionally left blank.

Figure 4-1. Locations of the soil borings collected at Debris Pile C and approximate locations of the ISM samples taken from Debris Piles, A, B, and C. Gray shaded areas show the actual size and shape of the Debris Pile A and Debris B.



This page intentionally left blank.

The surface soil ISM samples from Debris Pile B, C, and the apparent burn area were analyzed for the same chemicals as from Debris Pile A, except for pesticides. Discrete surface soil samples to be analyzed for VOCs were taken in the approximate middle of a sampling area at a depth of approximately 0.5 feet bgs.

Surface soil ISM samples were aggregated samples collected from stratified random locations within each of the designated sample areas. The sample aliquots were collected using a small-diameter ($^{7}/_{8}$ inch inside diameter) step probe. As per the FWSAP, the individual aliquot was obtained by pushing the step probe sampler to refusal or 12 inches in depth, whichever occurred first. In most cases refusal (apparent rock) was encountered prior to reaching a depth of 12 inches bgs. The entire volume of all aliquots was aggregated into a single (plastic bag) field sample. Discrete (Terra core) samples were collected in sample areas where the subsequent analysis was for VOCs, as per the seventh paragraph of Section 5.6.2.1.3 of the FWSAP. Tyvek® suits were worn by all samplers due to the suspected ACM in the area.

Triplicate surface ISM samples were taken to provide an overall evaluation of the total (field sampling + laboratory sample preparation + laboratory analysis) sampling and measurement process. Both field and laboratory QC procedures are required for ISM sampling. These procedures are described in the Quality Assurance Project Plan (QAPP) located in Appendix B of the WP.

4.4.3 Asbestos Sampling

Less than 6 inch square pieces of suspect transite (and a single piece of suspect roofing) were procured from Debris Piles A and B utilizing grab method sampling with a clean plastic or metal scoop. Each sample was placed in a large, airtight Ziploc® bag. Samples were double bagged prior to shipment to a National Voluntary Laboratory Accreditation Program (NVLAP0 accredited laboratory). Asbestos content was determined by EPA Method 600/R-93/116 to meet the requirements of 40 Code of Federal Regulations (CFR) Part 763, Subpart E, Appendix E, Section 1 Polarized Light microscopy. All asbestos sampling was performed by an Ohio Certified Asbestos Hazard Evaluation Specialist from Diamond Environmental.

4.4.4 Sampling of 55-Gallon Drum

Personnel from SWS Environmental Services collected samples from each drum using appropriate sampling equipment and Personal Protective Equipment (PPE) prescribed in the WP Addendum. Solid samples were collected in three glass jars capable of containing 100 grams of sample. Samples were labeled as appropriate, cooled to at least 4 °C, and analyzed within the EPA SW-846 established holding times. The sample from Drum #1, located at Debris Pile B, was described as a black tarry, rubbery substance and the sample from Drum #2, located at Debris Pile C, was described as brown/back organic material, dirt, wood, a squirrel's nest. The collected samples were forwarded to the primary laboratory where they were subjected to full TCLP analyses. Photographs of the 55-gallon drum sampling are provided as Photographs 6-9 through 6-12.

4.4.5 Sampling Decontamination

The driller decontaminated the core barrel shoe in the field after the completion of each boring prior to beginning the next boring.

The tools used to collect soil subsurface samples from the Geoprobe tubes were Terra Core samplers for VOCs and aluminum wedge samplers for the non-VOC samples. The Terra Core samplers were a one-time use, disposable item and thus did not require decontamination. The aluminum wedge samplers were decontaminated per the FWSAP protocols. After the aluminum wedge samplers had been decontaminated, they were wrapped in aluminum foil and placed in a covered plastic bin for transport to the field sites.

The tools used to collect soil surface samples were chromium plated step probes. The step probes were decontaminated per the FWSAP protocols. After the step probes were decontaminated, they were wrapped in aluminum foil.

4.5 Waste Management from Sampling Activities

The waste materials generated in the field were comprised of (soil cuttings from the Geoprobe tubes), (personal PPE, spent empty Geoprobe liners, used Terra Core samplers), and (general non-environmental trash). The soil cuttings were primarily collected in plastic garbage liners placed inside 5-gallon buckets. Additional soil materials were collected on the clear six millimeter (6-mil) thick plastic sheeting placed on the ground at the end of the cutting table and below the two five-gallon buckets used for collecting soil cuttings. A large garbage bag was used to contain the used nitrile gloves, the used Terra Core samplers, and cut-up pieces of Geoprobe liners. A long-handled steel lopper was used to cut the Geoprobe liners into 12 to 18 inch long pieces. Next, a large garbage bag was used to collect general non-environmental waste. The five-gallon buckets used in the field for hand wash and rinse were brought to Building 1036 and their contents emptied into the 55-gallon drum for decontamination water. The buckets for soil cuttings and the large garbage bags for PPE were brought back to Building 1036 and placed in appropriately labeled 55-gallon open-headed drums.

All Investigation-Derived Waste (IDW), including auger cuttings, PPE, disposable sampling equipment, and decontamination fluids, was properly handled, labeled, characterized, and managed in accordance with Section 8.0 of the FWSAP, federal and state of Ohio large-quantity generator requirements, and RVAAP's Installation Hazardous Waste Management Plan.

4.5.1 IDW Collection & Containerization

All solid non-indigenous (expendable sampling equipment and trash) IDW was segregated as non-contaminated and potentially contaminated material. Potentially contaminated and non-contaminated, solid, non-indigenous IDW was identified in the field on the basis of visual inspection (e.g., soiled versus not soiled) and usage of the waste material (e.g., outer sampling gloves versus glove liners). All non-contaminated, non-indigenous IDW was contained in trash bags. Potentially contaminated, non-indigenous IDW was contained in labeled Department of Transportation (DOT) approved, open-top, 55-gallon drums equipped with plastic drum liners and sealed with bung-top lids.

All liquid non-indigenous IDW (e.g., decontamination rinse water consisting of soap and water and water rinses from alcohol rinses [from methanol] and acid rinses [from 2% hydrochloric acid]) was placed in a labeled, DOT-approved 55-gallon closed-top drum. All known or potentially hazardous liquid, non-indigenous IDW streams, such as methanol, hydrochloric acid rinses, and acetone were contained separately in labeled DOT-approved, closed-top, 55-gallon drums.

4.5.2 Container Waste Labeling

All IDW containers were labeled prior to placing IDW in them. All IDW drums and were labeled in accordance with Section 8.2 of the FWSAP.

4.5.3 IDW Characterization and Classification for Disposal

The one drum of indigenous IDW (soil cuttings) was to be characterized for disposal based on analytical results from environmental samples collected from each sampling station. One of the samples, however, indicated an ACM content of two percent. Since all the soil cuttings were accumulated in one drum, a composite sample of the drum of soil cuttings was collected per Section 8.4.1 of the FWSAP and analyzed for ACM. The analysis of this sample indicated less than 0.25 percent asbestos and the drum of soil cuttings was removed and disposed of as non-hazardous, contaminated waste on March 6, 2012. A sample from the drum of non-indigenous IDW (decontamination fluids), was collected and subjected to the full TCLP analysis. The results of the full TCLP analyses indicated no levels in excess of TCLP criteria and this drum was removed and disposed of as non-hazardous, contaminated waste on March 6, 2012. Next, the drum of PPE and expendable sampling equipment was disposed of as non-hazardous, contaminated waste on March 6, 2012 based on the analytical results of the samples of both the soil cuttings and decontamination fluids.

All solid and liquid IDW shipments were removed from the site and disposed of by a licensed waste disposal contractor in accordance with Section 8.5 of the FWSAP and all applicable State and Federal rules, laws, and regulations. All shipments of IDW were coordinated through the RVAAP Environmental Coordinator and Caretaker Site Manager.

4.7 Drum Removal and Overpacking Activities

A two-person team from SWS Environmental Services excavated the two 55-gallon drums from their locations with a mini-excavator on February 16, 2012 and placed them along with any materials that were part of the drums, in 85-gallon steel over-pack drums. Drum #1 was considered "RCRA Characteristic Hazardous Waste" due to lead content and was incinerated at the Ross Incineration Services facility in Grafton, OH. Drum #2, which was considered "RCRA Non-Hazardous", was solidified and disposed of at the Stoney Hollow Landfill in Dayton, OH. In addition to the two person team from SWS Environmental Services, a representative from Prudent and Mr. Jay Johnson, an independent contractor and UXO Technician III, were on site during the drum removal and overpacking. Photographs of the drum removals are provided as Photographs 4-13 through 4-20. Copies of the drum removal documentation are provided as Appendix J.

Photograph 4-19. Drum #2 (Drum Over Packing Removal)
Moving the overpacked Drum #2 to the trailer.

Photograph 4-20. Wet decontamination of the mini-excavator from Debris Pile C

4.8 Drum Removal Equipment Decontamination

SWS Environmental Services performed decontamination of the drum removal equipment. Due to tree density, the track hoe was unable to access Drum #1 (within Debris Pile B). Since the track hoe stayed on the service road and did not go into the area of the hazardous waste drum and burn area, a decontamination pad was not necessary for Drum #1. Prudent rolled the over-packed hazardous waste drum from Debris Pile B to the service road so the track hoe could load it on the truck. Both vehicles remained on the service road.

At Debris Pile C the track hoe was used to remove the decomposed drum and soil at its location. Debris Pile C, Drum #2 TCLP results were non-hazardous. Tarps were used to capture waste dirt and rinse from the non-hazardous drum at Debris Pile C. The IDW was disposed of in the non-hazardous over-packed drum, as not to generate needless material waste since the drum and soil below it were non-hazardous (Photograph 6-20).

4.9 Safety/Anomaly Avoidance

A detailed description of health and safety requirements, including PPE, training, and medical surveillance, is provided in the Final Site Safety and Health Plan Addendum for 2010 Preliminary Assessment Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump (Prudent, 2011), Appendix C to the WP Addendum.

MEC avoidance support activity was completed by Mr. Travis Steele of ECC, a UXO Technician III for the soil sampling activities and Mr. Jay Johnson, an independent contractor and UXO Technician III, were on site during the drum removal and overpacking activities. The UXO Technician III escorted the field team and was on-site during all field activities. The UXO Technician III had completed a training program, prior to beginning work on site, which complies with Occupational Safety and Health Administration (OSHA) Regulations 29 CFR 1910.120e(9). The UXO technician verified that no metallic anomalies were present at surface or subsurface locations where soil samples were taken. The UXO technician was also onsite during the drum removal activities to keep drum removal equipment away from magnetic anomalies. All such work was conducted in accordance with the Anomaly Avoidance Plan in Appendix D of the WP Addendum.

4.10 Deviations from the Work Plan

The following items were added or not performed as prescribed in the WP Addendum and the FWSAP.

- The following samples were incorrectly listed on the QA Lab (CT) chain of custody (COC):

  Sample C78SS-005M-0001-SO was noted as C78SS-0005-0001-SO on the COC
  Sample C78SS-006-0001-SO was noted as C78SS-0006-0001-SO on the COC
  Sample C78SS-008M-0001-SO was noted as C78SS-0008-0001-SO on the COC
  Sample C78SS-008M-0002-SO was noted as C78SS-0008-0002-SO on the COC
  Sample C78SS-009-0002-BD was noted as C78SS-0009-0002-SO on the COC

- Sample C78SS-009-0002-BD was added to the QA Lab in the field as a quality assurance check on the ACM testing of transite

- Sample C78SS-012-0002-BD was added in the field to determine the ACM of a small piece of roofing removed from Debris Pile B.

This page intentionally left blank.

5.0 SUMMARY RESULTS, QA/QC, AND FINAL ACTIVITIES

This Section summarizes the sampling results for CC RVAAP-78. The entire laboratory analytical data for this SI are provided in Appendix H. Data tables are included in Appendix H and present the data for each area sampled by analyte group. Summary analytical results related to QA/QC is presented here in this Section. Additionally, discussion of the disposal of the IDW and analysis of the material in that was in the drums are included in this Section.

The data collected during this SI were verified and validated in accordance with the procedures outlined in the FWSAP (SAIC, 2011b). The processes used to evaluate the analytical data are described in this Section. The completed data verification report is included in Appendix G and the data validation report is included as Appendix I. Chemical data reported as non-detect were reported as not detected in the summary of analytical results tables included in this SI and at the Limit of Detection in Appendix H.

5.1 General Sampling Intervals, Types, and Analysis

The surface soil ISM samples (0 – 1' bgs) were collected adjacent to Debris Piles A and B, from within the apparent burn area adjacent to Debris Pile B, and from within Debris Pile C (Figure 4-1). Additionally, two samples of exposed material that appeared to be transite and a piece of roofing were collected from Debris Pile A and Debris Pile B.

Thirty individual soil samples (aliquots) were collected within each ISM sample area to comprise the ISM sample for that sample area. The depth of the surface ISM samples (triplicates) was inconsistent and was not always collected to extend from 0 – 1' bgs because rock was encountered in many locations at depths shallower than 1 foot. The objective was to assess average levels of contamination in surface soils adjacent to the Debris Piles A, B, within the apparent burn area, and Debris Pile C. All three ISM samples (primary, QC, and QA samples) collected at Debris Pile A were analyzed for explosives, propellants, TAL metals, SVOCs, VOCs, pesticides, PCBs, and asbestos, except for the two sets of Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples for which asbestos analysis was not performed. The surface soil ISM samples from Debris Pile B, C, and the apparent burn area were analyzed for the same chemicals as from Debris Pile A, except for pesticides. Discrete surface soil samples to be analyzed for VOCs were taken in the approximate middle of a sampling area at a depth of approximately 0.5 feet bgs.

Table 5-1. Summary of the analysis for the samples submitted for laboratory analysis.

	Sample Type	Analyte Type
	Debris Pile A	
1 Primary, 1 QC, and 1 QA	Surface Soil ISM	Metals, Explosives, Propellants, ACM[1], SVOCs[2], VOCs[3], Pesticides, and PCBs[4]
2	Discrete ACM Samples	Asbestos
	Debris Pile B	
1	Surface Soil ISM	Metals, Explosives, Propellants, ACM[1], SVOCs[2], VOCs[3], Pesticides, and PCBs[4]
1	Discrete ACM Sample	Asbestos
	Burn Area	
1	Surface Soil ISM	Metals, Explosives, Propellants, ACM[1], SVOCs[2] VOCs[3], Pesticides and PCBs[4]
	Debris Pile C	
1	Surface Soil ISM	Metals, Explosives, Propellants, ACM[1], SVOCs[2], VOCs[3], Pesticides, and PCBs[4]
6 Primary, 6 QC, 6 QA	Vertical Subsurface Soil ISM	Metals, Explosives, Propellants, ACM[1], SVOCs[2], VOCs[3], Pesticides, and PCBs[4]
1	1-3' Horizontal Subsurface Soil ISM	Metals, Explosives, Propellants, ACM[1], SVOCs[2], VOCs[3], Pesticides, and PCBs[4]
1 Primary, 1 QC, and 1 QA	3-5' Horizontal Subsurface Soil ISM	Metals, Explosives, Propellants, ACM[1], SVOCs[2], VOCs[3], Pesticides, and PCBs[4]
	55 Gallon Drums #1 and #2	
	Composite Sample of Contents	Full TCLP[5]
	Composite Sample of Contents	Full TCLP[5]

[1]ACM = Asbestos-containing material Metals are the Target Analyte List (TAL)
[2]SVOCs = Semi-Volatile Organic Compounds
[3] VOCs = Volatile Organic Compounds (discrete sample taken in middle of DU)
[4] PCBs = Polychlorinated biphenyls
[5]TCLP = Toxicity Characteristic Leaching Procedure

5.2 Data Verification, Validation, and QC

5.2.1 Data Verification and Validation

Data verification was performed on the samples. The analytical results were reported by the laboratory in accordance with the FWSAP (SAIC 2010).

Data qualifiers were assigned to each result based on the laboratory (i.e., TestAmerica of North Canton, Ohio) QA review and verification criteria. The SI analytical results were qualified as follows:

- "U" is not detected.
- "UJ" is not detected and the reporting limit is an estimated value.
- "J" denotes that the analyte was positively identified, but the associated numerical value is an approximate concentration of the analyte in the sample.
- "R" indicates that the result is not usable.

In addition to assigning qualifiers, the verification process also selected the appropriate result to use when re-analyses or dilutions were performed. Where laboratory surrogate recovery data or laboratory QC samples were outside of analytical method specifications, the verification chemist determined whether or not laboratory re-analysis should be used in place of an original reported result. If the laboratory reported results for both diluted and undiluted samples, diluted sample results were used for those analytes that exceeded the calibration range of the undiluted sample. A complete discussion of verification process results is contained in the Data Verification Report (Appendix G). A data validation report was completed for Site CC RVAAP-78. The report is provided in Appendix I. In general, the data validation performed for the CC RVAAP-78 SI indicates that no false negatives or false positives were identified, and the results are usable for their intended purposes.

5.2.2 Quality Control/Assurance/Analytical Problem Report

TestAmerica encountered several problems during analysis, described in the following Sections for each class of analyte.

5.2.2.1 Volatile Organic Analysis

TestAmerica did not conduct MS/MSD analyses due to lack of sample volumes.

Methylene Chloride was detected in method blanks MB 240-24100/1-A and MB 240-24114/1-A at levels above the method detection limit but below the reporting limit. Methylene Chloride was detected in method blank MB 240-24253/1-A at a level exceeding the reporting limit. Methylene chloride is common laboratory contaminants, and samples were flagged accordingly with "B".

- Failed Surrogate Recovery below Limits, Total samples Analyzed = 57

See Data Verification Report (DVRR) Section I for Surrogate Recovery Graphs and Section II for Data Sheets, and Sample IDs. Data are acceptable with a failure of one surrogate recovery.

The laboratory control sample (LCS) for prep. Batches #24114, and #24253 recovered outside acceptance limits for cis-1,3-Dichloropropene, and for Chloroethane respectively. There were insufficient samples to perform re-extractions and re-analyses.

Table 5-2. Summary of surrogate information for VOC analyses.

Surrogate	QC limits	%Mean Recoveries ±SD	No. Samples Failed	Graphs Section I, DVRR
DBFM (Dibromofluoromethane)	59-138%	76.3 ±8.86	2	Figure 1
BFB (4-Bromofluorobenzene)	85-120%	80.4 ±10.7	9	Figure 2
1,2-DCE (1,2-Dichloroethane)	61-130%	81.3 ±7.77	2	Figure 3
Toluene-d8 & BFB	85-115% 85-120%		11	
Toluene-d8	85-115	85.4 ±8.98	18	Figure 4

5.2.2.2 Semivolatile Organic Analysis

- Failed Surrogate Recoveries, Total samples analyzed = 30.

Data are acceptable with one surrogate that does not meet its QC Limits.

See Data Verification Report (DVRR) Section I for Surrogate Recovery Graphs and Section II for Data Sheets, and Sample IDs. Spike recoveries failed (MS/MSD) because spike concentrations were at much lower levels than those in samples.

Table 5-3. Summary of SVOC surrogate analyses.

Surrogate	QC limits	%Mean Recoveries ±SD	No. Samples Failed	Graphs Section I, DVRR
TPH (Terphenyl-d14)	30-125%	72.6 ±10.4	0	Figure 5
2FP (2-Fluorophenol)	35-105%	64.1 ±11.3	1	Figure 6
NBZ (Nitrobenzene-d5)	35-100%	59.3 ±10.1	1	Figure 7
PHL (Phenol-d5)	40-100%	61.8 ±10.0	1	Figure 8
TBP (2,4,6-Tribromophenol)	35-125%	55.2 ±14.2	2	Figure 9
FBP (2-Fluorobiphenyl)	45-105%	59.9 ±9.87	1	Figure 10

5.2.2.3 Organochlorine Pesticides

- Failed Surrogate Recoveries, Total sampled analyzed = 30

Only one surrogate is required for analysis; surrogate DCB is more appropriate for pesticide analysis than TCX due to the molecular weights of the pesticides. Also, DCB2 is for analysis in the confirmation column that is used only for confirmation and not for calculating compound concentrations. Data are acceptable based on the recovery of DCB1 within acceptable limits.

Several samples were diluted due to nature of sample matrix.

- Instrumental Problems

  Continuing calibration verification (CCV) was recovered above the upper control limits for several samples, and samples were not affected since there were no positive hits for pesticides.

No other difficulties were encountered.

Table 5-4. Summary of surrogate information for organochlorine pesticides.

Surrogate	QC limits	%Mean Recoveries ±SD	No. Samples Failed	Graphs Section I, DVRR
DCB1 (Decachlorobiphenyl)	55-130%	86.4 ±19.6	2 (MS & MSD)	Figure 19
DCB2 (Decachlorobiphenyl)	55-130%	147 ±68.6	15	Figure 21
TCX1 (Tetrachloro-m-xylene)	70-125%	154 ±110	15	Figure 20
TCX2 (Tetrachloro-m-xylene)	70-125%	85.3 ±14.5	6	Figure 22

5.2.2.4 Polychlorinated Biphenyl (PCB)

- Surrogate Recoveries: Total samples analyzed were 34.

Only two samples had DCB1 below the QC limits of 60 percent; sample C78SS-015M-0001-SO at 52% and C78DM-019-0001-WS at 53 percent.

Instrument Problems: The initial calibration verification (ICV) for Aroclor 1232 recovered above the upper control limit. Samples associated with this ICV, C78DM-017-0001-WS, C78DM-019-0001-WS were non-detects for the affected analytes.

No other difficulties were encountered.

5.2.2.5 Nitroaromatics & Nitramines: Explosive Residues

- Surrogate Recoveries, Total samples analyzed were 31.

3,4-Dinitrotoluene was recovered above the QC limits of 108 percent for one sample, #C78SS-001M-0001-SO, at 123 percent, and sample #C78SS-007-0001-SO at 143 percent, 117 percent and 118 percent for its MS/MSD analysis. The mean % surrogate recoveries was 96 ±12.4.

No other difficulties were encountered.

5.2.2.6 Metal Analysis

- Method Blanks

Potassium was detected in method blanks MB 240-24511/1-A and MB 240-25192/1- at levels above method detection limits but below the reporting limits. Antimony, Iron and Manganese failed the recovery criteria, low for the MS of sample C78SS-007-0001-SO (240-5866-45) in batch 240-25615. Antimony and Potassium exceeded the RPD limit for the duplicate of sample C78SS-007-0001-SODU (240-586-45). Aluminum failed the recovery criteria high.

- Instrument Problems

  Continuing calibration verification (CCV) for Antimony associated with batch 24511 recovered above the upper control limit. Samples associated with this CCV were non-detects for the affected analytes; therefore data are acceptable.

No other difficulties were encountered during the metals analyses. All other quality control parameters were met

5.2.3 Data Verification Report

TestAmerica assigned a unique laboratory lot number for each of the sample delivery groups for all the horizontal samples. A different lot number for vertical samples was assigned when they were analyzed.

For each laboratory lot number, TestAmerica submitted a hard copy of the summary report and an Electronic Data Deliverable (EDD) copy containing the summary report and an expanded report containing all the calibration, instrument print outs and chromatograms. The EDD was used to verify the data through the Automated Data Review (ADR) software and was reviewed to calibrate the data manually. The ADR software currently does not have the capability of reviewing calibration information.

In this report, the findings of the instrument calibration are presented first followed by ADR findings. The Data Verification Reports are provided in Appendix G. Appendix H includes CDs containing all TestAmerica's analytical data files.

5.2.4 Calibration

Details of instrument checks, initial calibrations, calibration verifications and continuing calibrations will be provided in the Data Validation Report by an independent contractor. Laboratory quality control showed that instruments' performances were acceptable.

5.2.5 Automated Data Review (ADR)

The ADR software from Laboratory Data Consultants (LDC) was used to develop an electronic Quality Assurance Project Plan (eQAPP), Final Ravenna ISM10192010) for the Ravenna project. The eQAPP contained all the analytical methods and the corresponding reporting and control limits required for this project. The analytical specifications for the eQAPP were taken from:

- *The Facility-wide Sampling and Analysis Plan for Environmental Investigations, Ravenna Army Ammunition Plant, Ravenna, Ohio,* March 2001
- *The Department of Defense (DOD) Quality Systems Manual (QSM) for Environmental Laboratories, version 4.1*
- *Appendix C, Laboratory Control Samples (LCS) Recovery Limits, Method Detection Limits (MDLs), Reporting Limits (RLs) and PRGs for SW-846 Methods, USACE Louisville District*
- The TestAmerica Laboratory Quality Control Manual

Electronic copies of the completed eQAPPs were supplied to TestAmerica and C.T. Laboratories. TestAmerica processed the project analytical data using the eQAPP.

Prudent independently reviewed all the analytical data supplied by TestAmerica in electronic format using the ADR software and the eQAPP. The ADR review flagged results according to eQAPP, checked for blank contamination and exceedance of control and spike limits, and produced a project summary report for each laboratory sample lot. The Automated Data Review (ADR) Report is provided in Appendix L.

5.2.6 Minimum Reporting Requirements

All data produced by TestAmerica was deemed acceptable and met the minimum reporting requirements for Laboratory Control Samples (LCS).

5.2.7 Laboratory Control Samples

The ADR and manual review showed at least one LCS was analyzed for each analytical batch for all analytical methods and no negative quality impact on the results. See Data Verification Report in Appendix G.

5.2.8 Surrogates

The ADR and manual review showed that recoveries of surrogates in the organic analytical methods were acceptable and control charts of surrogate recoveries provided assurance that the data are acceptable. Pesticide analyses showed some irregularities in surrogate recoveries from MS, MSDs. See Section I of the Data Verification Report, Appendix G.

5.3 Analysis of ISM Triplicate Samples

A summary of the relative standard deviations (RSD)s, which is defined as the (standard deviation)/(average), of the surface soil and subsurface soil ISM samples is provided on Tables 5-

4 and 5-5 The RSDs were only calculated for a given chemical when there were detections in the primary, field duplicate, and blind duplicate samples. An average of the RSDs associated with a given analysis was then calculated. For instance, if there were RSD(%)s of 8, 7, 9, 5, 12, and 13 for metals of a given set of primary, field duplicates, and blind duplicates, then the average RSD (%) for metals for that sample group would be 9. For some chemical groups there were more RSDs typically than for others. For instance, there were generally many more individual RSDs for metals than for non-metals.

Because the heterogeneity of the subsurface soil ISM horizontal and vertical ISM samples taken from Debris Pile C was much greater than that of the surface soil ISM samples taken at Debris Pile A, the surface soil and subsurface soil triplicates are considered separately.

For the surface soil set of triplicates taken from locations immediately adjacent to Debris Pile A, the following results were obtained:

> Average RSD (%) of 22 metals analyses was 20.0, with RSDs (%) for individual metals ranging from 0 to 100.3.
>
> Average RSD (%) of 17 non-metals was 51.8, with RSDs (%) for individual non-metals ranging from 21.8 to 74.3.

The subsurface horizontal and vertical ISM samples were taken at Debris Pile C atop an approximately 4-foot high ridge of apparently dumped materials. The materials within this ridge were extremely heterogeneous, see Photographs 4-2 and 4-3. For the subsurface soil sets of triplicates taken from locations atop the pile of dumped materials, the following results were obtained:

> Average RSD (%) of 21 metals analyses was 44.2, with RSDs (%) for individual metals ranging from 0 to 158.5.
>
> Average RSD (%) of 17 non-metals was 76.7, with RSDs (%) for individual non-metals ranging from 4.0 to 162.4.

Tables 5-4 and 5-6 for the metals shows that the RSDs for chromium, potassium, and titanium are significantly greater than those for the other metals. Upon consulting with the primary laboratory, TestAmerica, Inc., and the quality assurance laboratory, CT Laboratories, it was revealed that the sample preparation for the ISM samples at the primary lab consists of air drying, sieving, and then disaggregating the mixture, essentially just breaking up the large clods of soil; whereas the sample preparation at the quality assurance laboratory consists of air drying, sieving, and milling as follows. The samples were milled in a puck mill for one minute and then allowed to cool down for a minute. This was performed five times until the sample had a fine powder consistency to it.

Table 5-5. Relative Standard Deviation values calculated for the replicate comparison of the Primary, QC, and QA samples for metals assessed in ISM samples from Debris Pile A, Debris Pile B, and Debris Pile C.

Area	Sample ID	Type Sample	Sample Date	Sample Depth	Chemicals Analyzed	Al (mg/kg)	Sb (mg/kg)	As (mg/kg)	Ba (mg/kg)	Be (mg/kg)	Cd (mg/kg)	Cr (mg/kg)	Co (mg/kg)	Cu (mg/kg)	Pb (mg/kg)	Mg (mg/kg)	Mn (mg/kg)	Hg (mg/kg)	Ni (mg/kg)	Se (mg/kg)	Ag (mg/kg)	Tl (mg/kg)	V (mg/kg)	Zn (mg/kg)

Significantly elevated concentrations of chromium because of the milling have been observed in other projects and this effect is discussed in Section 6.3.3 of *the Interstate Technology & Regulatory Council Guidance for Incremental Sampling Methodology*, February 2012.

If the RSDs for chromium, potassium, and titanium are removed, the surface soil average RSDs from Debris Pile A are reduced from 20.0 to 13.6.

If the RSDs for chromium, potassium, and titanium are removed, the subsurface soil average RSDs from Debris Pile C is reduced from 44.2 to 35.0.

5.4 Evaluation of Primary and Duplicate Asbestos Analyses and Results

Two small pieces of transite from Debris Pile A were sampled. The primary sample, C78SS-009-0001-BD, was analyzed at a subcontract laboratory for the primary laboratory and a detection of 30 percent Chrysotile was measured. The QA sample, C78SS-009-0002, was analyzed at a subcontract laboratory for the QA laboratory and yielded a detection of 15 percent Chrysotile. Both analyses detected significant amounts of Chrysotile, however, the primary sample showed twice the amount as the QA sample.

Asbestos contents of 30 percent and 40 percent were detected in the transite samples from Debris Piles A and B, respectively, and the roofing sample from Debris Pile B had a level of 35 percent asbestos. All the soil samples were analyzed for asbestos. All the soil samples were non-detect or less than 1 percent asbestos, except for sample C78SB-021M-0001-SO, one of the subsurface soil vertical ISM samples from Debris Pile C, which had a level of 2 percent asbestos.

5.5 Final Site Activities

5.5.1 Field Inspection

On November 10, 2011, Prudent personnel inspected the locations where sampling was performed during this project at CC RVAAP-78 and removed any remaining materials associated with its sampling work.

5.5.2 Final Inspection

After final cleanup and storage of remaining materials, Mark Patterson, the RVAAP Facility Manager, inspected the Prudent area at Building 1036 and indicated that the area was acceptable. Prudent complied with Mr. Patterson request to place yellow caution tape around the Prudent work area in Building 1036.

5.6 TCLP Sampling Results

Analytical results for the surface soil ISM samples, horizontal and vertical subsurface soil ISM samples, and 55-gallon composite drum samples are provided in Tables 5-7 and 5-8. Sampling of the contents of Drum #1 and Drum #2 took place on November 10, 2011. The material within Drum #1 was described as a black/brown tarry, rubbery substance, and the material within Drum #2 was described as a brown organic material which appeared to be dirt, wood, and a squirrel nest. Toxicity Characteristic Leaching Procedure (TCLP) analyses on samples of the contents from the

two drums revealed the contents of Drum #1 to be Resource Conservation and Recovery Act (RCRA) characteristic hazardous waste for lead and the contents of Drum #2 to be non-hazardous. Both drums were removed from the site on February 16, 2012 and disposed of according to state and federal requirements.

6.0 CHEMICAL DATA EVALUATION

6.1 Introduction

The initial intrusive investigation at CC RVAAP-78 was conducted in November 2011. The investigation included surface soil ISM sampling at the *apparent* Burn Area and Debris Piles A, B, and C; subsurface soil ISM sampling at Debris Pile C; and sampling of the contents of the two rusted drums. Discussion of the results and QA/QC evaluation was provided in Section 5. This section focuses on evaluating the data collected from the surface and subsurface samples, determining if the detected chemical is a site related chemical (SRC), and if so, is it in concentrations great enough to be considered contamination. There were two primary objectives for this SI: determine if asbestos is present in the soil or materials in the debris Piles and determine if there is chemical contamination. If either of these are identified, then additional remedial actions are required and the next phase in the CERCLA process would likely be an RI.

As stated previously in Section 5, asbestos was identified in the soil from Debris Pile C soil borings at 2% (1% is regulated value). Additionally, roofing samples and transite samples from Debris Piles A and B were both positive for asbestos. Therefore, the asbestos is present in the Debris Piles. It should be noted that because of potential asbestos, surface soil samples at Debris Piles A and B were collected immediately adjacent to the piles. Transite was observed in both Debris Piles A and B. The surface soil ISM sampling at the apparent Burn Area and Debris Pile C and the subsurface soil ISM sampling at Debris Pile C, however, were conducted within these two areas.

Contamination is evaluated in this SI by comparing the maximum concentration of each analyte detected for each of the following samples areas: Debris Pile A, Debris Pile B, and Debris Pile C. Debris Pile C evaluations also included assessing the maximum detected concentrations in surface and subsurface soil. Complete results tables that are arranged by analyte for Debris Pile A, Debris Pile B, and Debris Pile C can be found in Appendix M. Triplicate sample results are presented in the Tables as well. Where triplicate sample results are presented, the Relative Standard Deviation (RSD) for individual analyses are calculated for detections and an average RSD is shown at the bottom of the table for that set of analyses.

The *apparent* Burn Area is within the Debris Pile B. The apparent Burn Area was not individually assessed to determine if SRCs were present because analytes analyzed for in the soil samples were not detected. Additionally, the concentrations of chemicals in the Debris Pile B were much greater than of the detected chemicals in the Apparent Burn Area and were therefore addressed as part of Debris Pile B. The data tables arranged by analysis type for the *apparent* Burn Area are presented in Appendix M.

The determination for SRCs and contamination in this SI is based solely on the maximum value determined for the subsurface at all three Debris Piles and for the vertical and horizontal ISM samples collected from the subsurface from Debris Pile C. The process to identify SRCs and contamination as well as the results are discussed in the following sections.

6.2 Determination of Site Related Chemicals

This section provides an outline of the process used to determine if potential contamination is present at this AOC. Per the *Facility-Wide Human Health Risk Assessment Manual* (USACE 2005), a chemical detected at a concentration greater than the established background value, which is not an essential nutrient, or screened out through a frequency of detection evaluation is identified as an SRC.

An SRC may, or may not, be related to the former operations at the site. The maximum detected concentration of each SRC is then compared to the most stringent FWCUG for the Resident Receptor between the adult and child using the Target Cancer Risk (TCR) level of 10^{-6} or the Target Hazard Quotient (THQ) of 0.1 for each SRC, as outlined in the *Final Facility-Wide Human Health Cleanup Goals for RVAAP* (SAIC 2010). Both risk levels (carcinogenic and non-carcinogenic) were assessed for the Resident Receptor (adult and child) to determine which one was the most stringent for comparison to each SRC. The specific criteria used to identify SRCs and potential contamination at the AOC are described below:

Background Screening — The maximum detected concentrations of inorganic chemicals were compared to the RVAAP background concentrations, where established. If exceedances of background concentrations occurred, the respective inorganic chemicals were identified as SRCs. Several inorganic chemicals were screened against a background concentration of 0 milligrams per kilogram (mg/kg) (e.g., cadmium, silver). A value of 0 mg/kg was assigned as background when the chemical was not detected in any of the samples collected during the background study.

Screening of Essential Human Nutrients — Chemicals that are essential nutrients (e.g., calcium, chloride, iodine, iron, magnesium, potassium, phosphorous, and sodium) are an integral part of the human food supply and often added to foods as supplements. The USEPA recommends these chemicals not be evaluated unless they are grossly elevated relative to background concentrations or would exhibit toxicity at the observed concentrations (USEPA 1989).

Frequency of Detection/WOE — A frequency of detection evaluation was not completed as part of the WOE since less than 20 soil samples were collected during this investigation. Therefore, frequency of detection was not used to further screen the identified SRCs as part of this SI. The SRCs that exceeded the most stringent Resident Receptor FWCUGs using the TCR level of 10^{-6} or THQ = 0.1 for non-carcinogenic risks are generally evaluated further using a WOE approach, to determine if the SRC is AOC-related. A WOE evaluation considers the SRCs that exceeded their FWCUGs, as described above, to determine if the chemical should be identified as potential contamination. If the results of the WOE evaluation indicated that potential contamination was present, then an additional investigation, such as an RI, is recommended. However, if no potential contamination was identified, then NFA is recommended. Since this SI involves asbestos and clearly has potential hazards, as WOE evaluation was not completed.

If no FWCUG has been developed for the particular chemical, then the USEPA's Regional Screening Levels (RSLs) (USEPA 2015) for the Residential Receptor were used for comparison using the same TCR of 10^{-6} and THQ of 0.1. If potential contamination is identified in this SI, it indicates that further investigation under CERCLA, in the form of an RI, is warranted at this AOC.

The maximum surface and subsurface soil chemical concentrations detected during this sampling are provided on Table 6-1 for Debris Pile A and Table 6-2 for Debris Pile B. Table 6-3 presents the maximum value assessed in surface soils from Debris C and Table 6-4 presents the maximum from subsurface soils from Debris Pile C samples. Many analytes in these tables are listed (qualified) as non-detected values (U) or estimated values (J). Generally, these would not be evaluated to determine if they are SRCs. These chemicals are retained and evaluated to ensure any potential contamination is identified.

As indicated in Tables 6-1, 6-2, 6-3, and 6-4, all organic chemicals that were detected were identified as SRCs by default since there is no background values established for the RVAAP restoration program for these types of chemicals. The SRC analysis was completed for the metals that were detected in the surface soil for each of the three sites as well as the subsurface at Debris Pile C. The following lists the metals (based on the maximum value) from each Debris Pile that were identified as SRCs:

- Debris Pile A - Surface Soil (Table 6-1): manganese.
- Debris Pile B - Surface Soil (Table 6-2): arsenic, chromium and manganese.
- Debris Pile C - Surface Soil (Table 6-3): arsenic, chromium, manganese.
- Debris Pile C - Subsurface Soil (Table 6-4): cadmium and manganese.

6.3 Determination of Potential Chemical Contamination

The next step in determining if chemical contamination is present in the Debris Piles was to compare the maximum value for each chemical determined to be an SRC to that of the most stringent FWCUG for the Resident Receptor. The most stringent value between the adult and the child was selected at the most stringent value for between the FWCUGs at the 10-6 cancer risk level or the HQ of 0.1 level. The last column in Tables 6-1 through 6-4 have a "Yes" in them if the chemical was identified as potential contamination which indicates additional remedial action is warranted.

The determination of potential contamination was completed for all chemicals identified as SRCs. that were detected in the surface soil for each of the three sites as well as the subsurface at Debris Pile C. The following lists the chemicals identified as contamination (based on the maximum value) from each Debris Pile:

- Debris Pile A - Surface Soil (Table 6-1):
    - Explosives/Propellants: 1,3-dinitrobenzene (qualified as a U value - non-detect).
    - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value) and benzo(a)pyrene.
    - Pesticides/Herbicides, PCBs, and VOCs: none.
- Debris Pile B - Surface Soil (Table 6-2):

- Metals: arsenic, chromium, and manganese.
- Explosives/Propellants: 2,4,6-trinitrolouene (qualified as a J value - estimated).
- SVOCs: 2-methyl-4,6-dinitro.phenol (qualified as a UJ value); bis(2-chloroethyl) ether; benzo(a)pyrene; and hexachloro-cyclopentadiene.
- PCBs: Aroclor 1254 value was 0.21 mg/kg and screening value is 0.21 mg/kg).
- Pesticides/Herbicides and VOCs: none.

- Debris Pile C - Surface Soil (Table 6-3):
  - Metals: arsenic, chromium, manganese, and nickel.
  - Explosives/Propellants: none.
  - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value); benz(a)anthracene; benzo(a)pyrene; bis(2-chloroethyl)ether; and hexachlorocyclopentadiene.
  - Pesticides/Herbicides, PCBs, and VOCs: none

- Debris Pile C - Subsurface Soil (Table 6-4):
  - Metals: cadmium and manganese.
  - Explosives/Propellants: none.
  - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value); benz(a)anthracene; benzo(a)pyrene; benzo(b)fluoroanthene; bis (2-chloroethyl)ether; dibenz(a,h) anthracene; N-nitroso-di-n-propylamine; and hexachloro-cyclopentadiene.
  - PCBs: Aroclor 1254.
  - Pesticides/Herbicides and VOCs: none.

Table 6-1. Screening results for the determination of SRCs and Contamination in surface soil from debris Pile A using the maximum concentration detected per analyte.

7.0 EXPOSURE PATHWAYS

7.1 Soil Exposure and Air Pathways

7.1.1 Physical Conditions

The previous environmental work at the RVAAP-16 AOC provides much information about the soils adjacent to the debris pile areas. See Section 2 of this SI for more details. The *U.S. Department of Agriculture Portage County Soil Survey* indicates that the soil within CC RVAAP-78 is defined as "pit, quarries" with possibly Mitiwanga Silt Loam in the eastern portion of Debris Pile A. Fill materials, including transite, are present at the base of the steeply inclined rock slopes in Debris Piles A and B.

7.1.2 Potential Soil and Air Pathways

Currently, soil and air targets, as described in the Abbreviated Preliminary Assessment Guidance (US EPA, 1999), at CC RVAAP-78 are limited due to low activity levels. However, in the future, the OHARNG plans to use this area for military training. A Feasibility Study (FS), Record of Decision (ROD), Remedial Design (RD), and Remedial Action (RA) for the Fuze and Booster Quarry Landfill/Ponds addressed the larger area surrounding and in the vicinity of CC RVAAP-78. These studies, did not specifically address the dumping and potential asbestos at the CC RVAAP-78 AOC. Use of the data from previous reports and sampling areas is limited to their impact on this AOC. Although the FBQ investigations for the Landfill/Ponds addressed the large areas surrounding the area of CC RVAAP-78, they did not specifically address any potential transite problems or the Debris Piles. Primary pathways for the exposure to chemicals and asbestos include airborne inhalation, incidental ingestion, and dermal contact. During the site reconnaissance, transite materials were observed in a broken and friable condition. Disturbance of this material may cause the asbestos fibers to be airborne and thus create an inhalation hazard. Section 6 describes the chemicals that were identified as SRCs and potential chemical contamination. The levels of asbestos ranging from 30 percent to 40 percent were detected in samples of transite and roofing material.

7.1.3 Soil Exposure and Air Pathways Conclusion

Following investigation and remediation of the FBQ Landfill/Ponds, three debris piles were encountered within this area which required additional consideration. These three debris piles constitute the Quarry Pond Surface Dump, CC RVAAP-78, which is assessed in this SI. Observations and additional field sampling and analyses in this SI have indicated possible exposure to asbestos and chemical contamination at the AOC. Potential exposure to friable asbestos fibers from the residual transite and roofing materials at CC RVAAP-78 may occur if the soil is disturbed. The likelihood of asbestos fibers being released into the air is greater if asbestos material is disturbed. Exposure to chemicals in the soil is likely, if the activity disturbs the soil and the receptor contacts the soil. The potential for exposure increases the longer the contact occurs on site.

There is another area that was identified while completing the sampling for this SI but it was not evaluated. There was materials between identified between Debris Piles A and B. This area should

be evaluated further in the next phase of the CERCLA process (an RI) to determine if there is asbestos or chemical contamination present here are well.

There is another are that was identified while completing the sampling for this SI but was not evaluated. There was materials between identified between Debris Piles A and B. This area should be evaluated further to determine if there is asbestos or chemical contamination present.

7.2 Groundwater Pathway

7.2.1 Hydrogeologic Setting

The CC RVAAP-78 AOC is located within the RVAAP-16 AOC. Following investigation and remediation of the FBQ Landfill/Ponds, three debris piles were encountered within this area which required additional consideration. These three debris piles constitute the Quarry Pond Surface Dump, CC RVAAP-78 which is being investigated in this SI. The hydrogeologic setting for RVAAP-16 is contained in Section 2 of the *Phase I/Phase II Remedial Investigation of the Fuze and Booster Quarry Landfill/Ponds (RVAAP-16),* dated November 2005. Groundwater flow is toward the south and west. A figure entitled, "Geologic Cross-Section of Fuze and Booster Quarry Ponds (RVAAP-16)" from the above-referenced investigation is included herein as Figure 7-1 for reference.

7.2.2 Groundwater Pathways

Groundwater at the AOC is not currently utilized. The OHARNG may utilize groundwater in the future in select areas on the facility. Groundwater wells located in the vicinity of the AOC are being assessed under the facility-wide Groundwater Monitoring Program.

7.2.3 Groundwater Pathway Conclusions

Based on the historical research in Section 3.2 of the HRRR, sample results from groundwater monitoring wells near CC RVAAP-78 should be assessed further as currently being done under the groundwater monitoring program. Considering these results and the AOC's location relative to groundwater bearing units and geologic setting, there is a low likelihood of a release to groundwater from the migration of contaminants through soil and the underlying rock. Groundwater is being addressed under the facility-wide Groundwater Monitoring Program.

7.3 Surface Water Pathway

7.3.1 Surface Water Setting

Surface water and sediment are not present on the AOC. Therefore, this is an incomplete pathway and is not evaluated further.

7.3.2 Surface Water Pathway Conclusions

There is no surface water or sediment on the AOC so the surface water and sediment pathway is considered incomplete for this AOC.

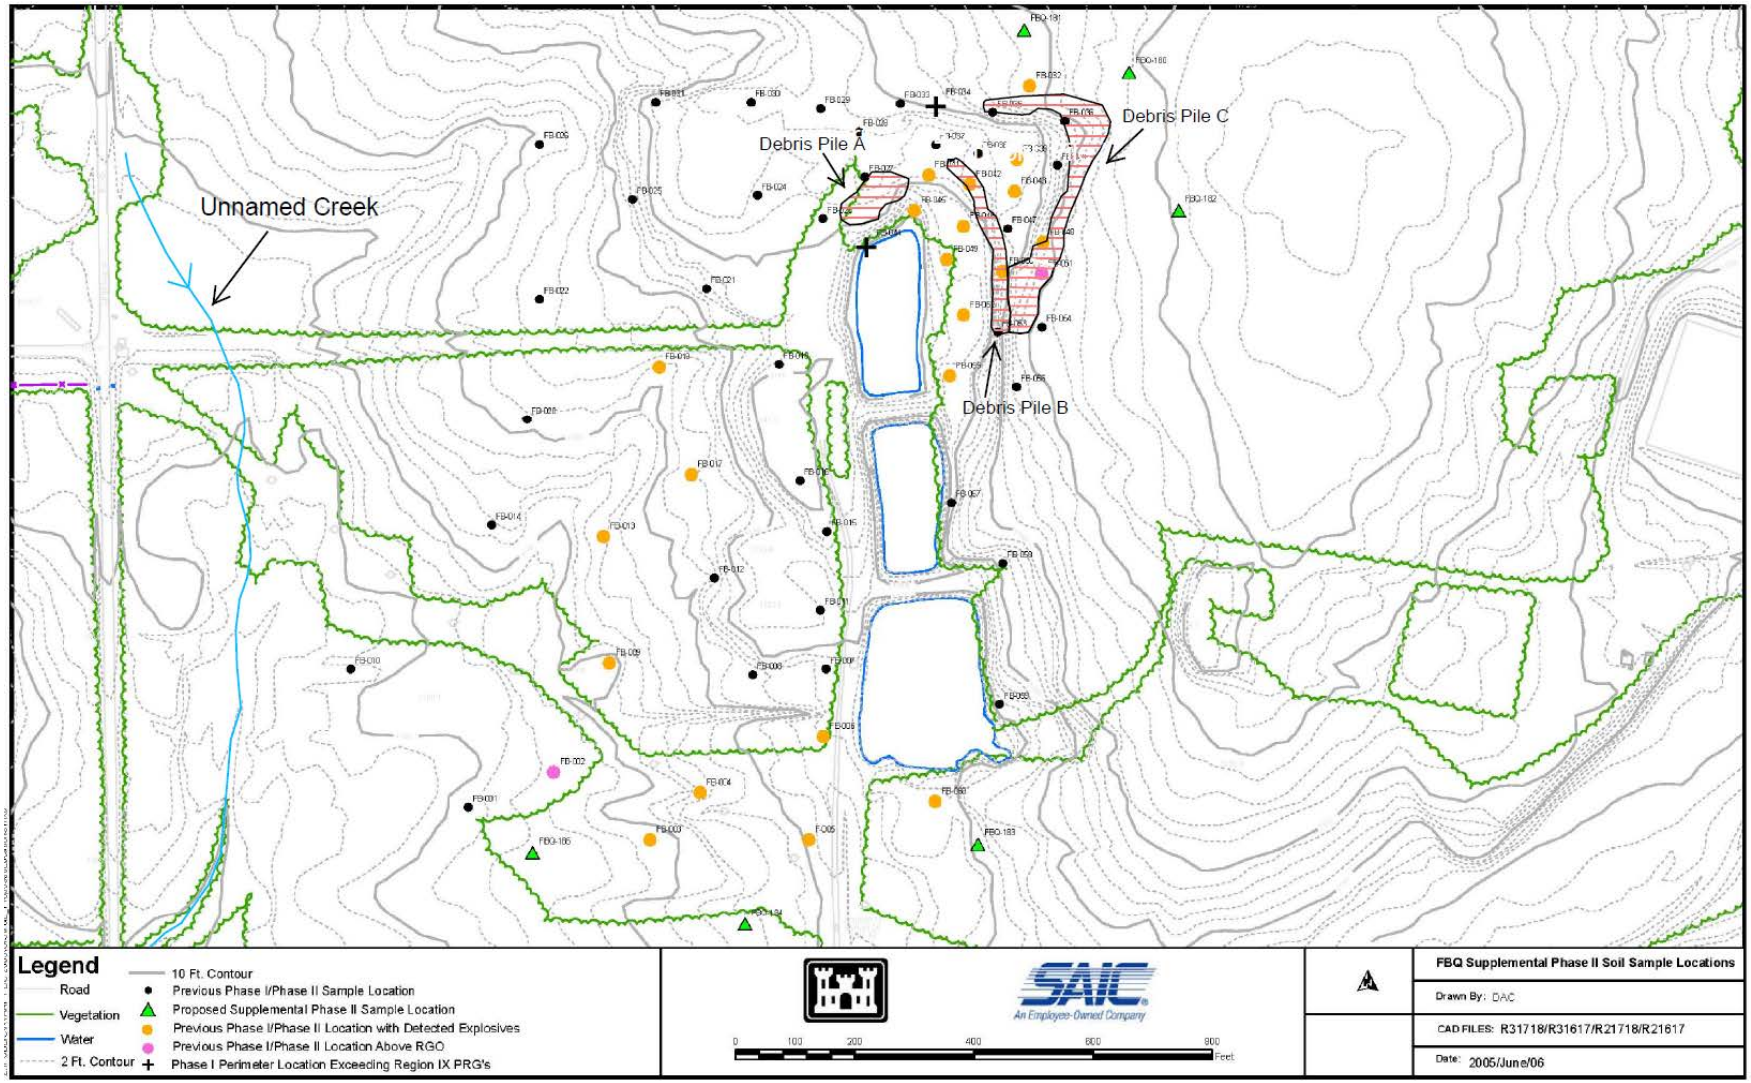

Figure 7-1. Surface Water Flow from Debris Piles A, B, and C. **Figure taken from SAIC's Final Sampling and Analysis Plan Addendum No. 1 for the Supplemental Phase II Remedial Investigations November 2005.**

This page intentionally left blank.

8.0 SUMMARY AND RECOMMENDATIONS

8.1 FINDINGS

The initial intrusive investigation at CC RVAAP-78 was conducted in November 2011. The investigation included surface soil ISM sampling at the apparent Burn Area and Debris Piles A, B, and C; subsurface soil ISM sampling at Debris Pile C; and sampling of the contents of the two rusted drums that were removed as part of this SI.

8.1.1 Asbestos

Transite was observed in both Debris Piles A and B. The surface soil ISM sampling at the apparent Burn Area and Debris Pile C and the subsurface soil ISM sampling at Debris Pile C, was conducted. Asbestos contents of 30 percent and 40 percent were detected in the transite samples from Debris Piles A and B, respectively, and the roofing sample from Debris Pile B had a level of 35 percent asbestos. All the soil samples were analyzed for asbestos. All the soil samples were non-detect or less than 1 percent asbestos, except for sample C78SB-021M-0001-SO, one of the subsurface soil vertical ISM samples from Debris Pile C, which had a level of 2 percent asbestos.

8.1.2 Drums

Sampling of the contents of Drum #1 and Drum #2 took place on November 10, 2011. The material within Drum #1 was described as a black/brown tarry, rubbery substance, and the material within Drum #2 was described as a brown organic material which appeared to be dirt, wood, and a squirrel nest. Toxicity Characteristic Leaching Procedure (TCLP) analyses on samples of the contents from the two drums revealed the contents of Drum #1 to be Resource Conservation and Recovery Act (RCRA) characteristic hazardous waste for lead and the contents of Drum #2 to be non-hazardous. Both drums were removed from the site on February 16, 2012 and disposed of according to state and federal requirements.

8.1.3 Chemical Contamination

The maximum surface and subsurface soil chemical concentrations detected during this sampling were assessed to determine if they were SRCs as well as potential contamination in Section 6 of this SI. The *apparent* Burn Area is within the Debris Pile B. The apparent Burn Area was not assessed for the determination of SRCs or contamination since most of the analytes were not detected and the concentrations of chemicals in the Debris Pike B were much greater. The data tables arranged by analysis type for the *apparent* Burn Area are presented in Appendix M.

The following lists the chemicals identified as contamination (based on the maximum value) from each Debris Pile:

- Debris Pile A - Surface Soil (Table 6-1):
    - Explosives/Propellants: 1,3-dinitrobenzene (qualified as a U value - non-detect).
    - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value) and benzo(a)pyrene.
    - Pesticides/Herbicides, PCBs, and VOCs: none.

- Debris Pile B - Surface Soil (Table 6-2):
    - Metals: arsenic, chromium, and manganese.
    - Explosives/Propellants: 2,4,6-trinitrolouene (qualified as a J value - estimated).
    - SVOCs: 2-methyl-4,6-dinitro.phenol (qualified as a UJ value); bis(2-chloroethyl) ether; benzo(a)pyrene; and hexachloro-cyclopentadiene.
    - PCBs: Aroclor 1254 value was 0.21 mg/kg and screening value is 0.21 mg/kg).
    - Pesticides/Herbicides and VOCs: none.
- Debris Pile C - Surface Soil (Table 6-3):
    - Metals: arsenic, chromium, manganese, and nickel.
    - Explosives/Propellants: none.
    - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value); benz(a)anthracene; benzo(a)pyrene; bis(2-chloroethyl)ether; and hexachlorocyclopentadiene.
    - Pesticides/Herbicides, PCBs, and VOCs: none
- Debris Pile C - Subsurface Soil (Table 6-4):
    - Metals: cadmium and manganese.
    - Explosives/Propellants: none.
    - SVOCs: 2-methyl-4,6-dinitrophenol (qualified as a UJ value); benz(a)anthracene; benzo(a)pyrene; benzo(b)fluoroanthene; bis (2-chloroethyl)ether; dibenz(a,h) anthracene; N-nitroso-di-n-propylamine; and hexachloro-cyclopentadiene.
    - PCBs: Aroclor 1254.
    - Pesticides/Herbicides and VOCs: none.

8.2 Recommendations

Because asbestos and chemical contamination were found in Debris Piles A, B, and C, additional remedial action is warranted and this AOC should proceed to the next phase in the CERCLA process. Based on the results of this SI, the AOC should proceed to an RI for further investigation. Additionally, it is recommended that the RI include an additional investigation of the area between Debris Piles A and B and the road adjacent to the east side of the northern-most pond.

Appendix B - Tailgate Health & Safety Meeting Logs

TAILGATE SAFETY MEETING LOG

PROJECT NAME: CC-78 **PROJECT NO:** 651002

DATE: 11/09 M Tu (W) Th F Sa Su TIME: 7:30am

WEATHER: clear + cool

WORKING CONDITIONS:

PPE:

ITEMS DISCUSSED:

- Safety near drill rig - eye, ear protection, hard hat
- trips, slips + falls - rocky unlevel ground
- brushy areas, lots of thorny bushes
- water - drowning hazard
- cold - weather ticks, other bugs
- Mushrooms with smoke
- no food or drink @ sampling table
- UXO safety from Travis
- wild animals - dogs, coyotes, deer
- asbestos

THE FOLLOWING INDIVIDUALS ATTENDED THE DAILY TAILGATE SAFETY MEETING (SIGNATURES)

SITE SAFETY AND HEALTH OFFICER

VISITOR LOG

11/9/11	Mark Patterson	Mark Patt	10:15
11/9/11	Scott Kelly	T. Scott Kelly	10:15
11/9/11	ERIC CHENG	EC	10:15
11/9/11	MARK NICHTER.	Mark W. Nichter	10:15

DAILY TAILGATE MEETING FORM

Site Name & Number: RVAAP C-78
Project Number: 60510002
Work Being Performed: Surface MI sampling
Date & Time of Meeting: 11-10-11 @ 7:40 AM
Name of Presenter: A. Miller & J. Joint

NOTE: On the initial day of the project, the Project Manager or designee should conduct a visual inspection of the project site prior to the Tailgate Meeting. This inspection should include a review of project site equipment, hazards, and specific job tasks, activities or operations to be performed for that day. These specific items must be covered during the Tailgate Meeting. For subsequent days, any changes to the site or operations must be covered in Tailgate Meeting.

Itemize the Specific Topics Discussed (if more space is needed use the back of this page):

Slips, trips & falls
wild animals
insects
UXO safety

Participants (if needed, list additional participants on back of this page):

Print Name	Signature	Company	Date
Amanda Miller		PRUDENT	11-10-11
Travis Stark		ECC	11-10-11
Keith R Bickel		Diamond	11-10-11
John Joint		Prudent	11-10-11
Tamas Hegymegi		Prudent	11-10-11
Joe Kirkey		SWS	11-10-11
Chris Bean		SWS	11-10-11

A Tailgate Safety Meeting must be conducted and documented at the beginning of each workday when two or more Prudent employees and/or subcontractor representatives are present on site. Employees, client representatives and subcontractors who arrive at the site after the Tailgate Safety Meeting has been conducted must be briefed on the topics and acknowledge by signing this form.

DAILY QUALITY CONTROL REPORT

Project CC-78 Initial Intrusive Investigation
USACE Contract No. W912QR-10-P-0052 Corp Technical Manager- Tom Chanda
Contractor- Prudent Technologies, Inc Contractor Project Manager- John Jent

Date 11-9-2011 Day of Week WED
(MM/DD/YEAR)
Weather- General ____ Bright; ____ Sunny; ____ Clear; ✓ Overcast; ____ Rain
Temp 60
Wind ____ Still: ✓ Moderate; ____ High
Humidity ____ Dry; ✓ Moderate; ____ Humid

Contractor Personnel: AMANDA MILLER, TOMAS HERNANDEZ, JOHN JENT

Visitors on site: MARK PATTERSON, MARK MCINTER, SCOTT KELLY
ERIC CHANG

Subcontractors on Site - Name (Company): JEREMY LECKRONE (GRONTZ DRILLING)
KEITH BICKEL (DIAMOND ENVIRO)

Equipment on Site: GEOPROBE TRACK-MOUNTED

Work Performed:

PRIMARY, QC, + QA SUBSURFACE SOIL ISM SAMPLING AT DEBRIS PILE C
SURFACE SOIL ISM SAMPLING AT DEBRIS PILE C + BURN
AREA

Date 11-9-2011
(MM/DD/2010)

Work Performed (Continued)

Quality Control Activities (Including Field Calibrations):

TRIPLICATE SUBSURFACE ISM SAMPLING AT DEBRIS PILE C

Health and Safety Levels and Activities:

LEVEL C, SAFETY TAILGATE MTG. -- LIFE RING + 50' ROPE AT BASE OF DEBRIS PILE C ADJACENT TO NORTHERN-MOST POND

Problems Encountered/Resolution or Corrective Action Taken:

RAIN - 4:00 ENDED SAMPLING

Remarks:

Tomorrow's Expectations: FINISH SURFACE SOIL SAMPLING AT DEBRIS PILES A & B, TRANSITE SAMPLING, & DRUM SAMPLING

Prepared by: [signature] (Signature & Date) 11-9-2011

QA Check by: _____ (Signature & Date)

DAILY QUALITY CONTROL REPORT

Project CC-78 Initial Intrusive Investigation
USACE Contract No. W912QR-10-P-0052 Corp Technical Manager- Tom Chanda
Contractor- Prudent Technologies, Inc Contractor Project Manager- John Jent

Date 11-10-2011 Day of Week THURSDAY
(MM/DD/YEAR)

Weather- General ____ Bright; ✓ Sunny; ____ Clear ; ____ Overcast; ____ Rain
Temp 40
Wind ____ Still: ✓ Moderate; ____ High
Humidity ✓ Dry; ____ Moderate; ____ Humid

Contractor Personnel: AMANDA MILLER, TOMAS HERNANDEZ, JOHN JENT

Visitors on site: NONE

Subcontractors on Site - Name (Company): KEITH BICKEL (DIAMOND)
JOE KIRK + CHRIS BEAN (SWS ENVIRO)

Equipment on Site: NONE

Work Performed:

DEBRIS PILE A- PRIMARY, QC + QA ISM SURFACE SOIL SAMPLES
PRIMARY, QC, + QA DISCRETE SURFACE SOIL VOC SAMPLES
PRIMARY + QA SAMPLES OF TRANSITE
DEBRIS PILE B- PRIMARY ISM SURFACE SOIL SAMPLE
PRIMARY DISCRETE SURFACE SOIL VOC SAMPLE
PRIMARY TRANSITE + ROOFING MATERIAL SAMPLE
~~BURN AREA~~ ~~PRIMARY ISM SURFACE SOIL SAMPLE~~
~~PRIMARY DISCRETE SURFACE SOIL VOC SAMPLE~~
DRUM ~~SAMPLE~~ #1 SAMPLE OF DRUM CONTENTS
DRUM #2 SAMPLE OF DRUM CONTENTS

Date 11-10-2011
(MM/DD/2010)

Work Performed (Continued)

Quality Control Activities (Including Field Calibrations):

TRIPLICATE SURFACE SOIL ISM + DISCRETE SAMPLES

Health and Safety Levels and Activities:

LEVEL B FOR DRUM SAMPLING

TYVEK FOR DEBRIS PILE A + B SAMPLING

Problems Encountered/Resolution or Corrective Action Taken:

NONE

Remarks:

Tomorrow's Expectations: TRAVEL HOME

Report #DVRR02192012

22 February 2012

smansy@prudentweb.com

Table of Contents:

Section 1.0 Project Description

Section 2.0 Project Organization & Responsibilities

Section 3.0 Data Verification Summary

Section 4.0 Section I - Surrogate Recoveries Graph

Section 5.0 Section II – Surrogate Recoveries Data Sheets

Section 6.0 Section III – Comparison Tables, QA/QC Results

Section 1.0 - Project Description

The purpose and scope of the intrusive investigation, data quality objectives, and incremental sampling methodology activities are described in Sections 6.1, 6.2 and 6.5 of the main report.

A full analytical suite is defined as samples that will be analyzed for TAL metals, mercury, explosives, VOCs, SVOCs, propellants, pesticides, and PCBs. For this project, surface Incremental Sampling Methodology (ISM) samples were collected and analyzed from areas surrounding Debris Piles A and B and from within Debris Pile C and the apparent burn area to determine the presence of absence of contamination. The samples collected from the apparent burn area were analyzed for the Ravenna full suite. Additionally discrete samples of apparent transite were collected within Debris Piles A, B and C to determine if Asbestos Containing Materials (ACM) are present. Two 55-gallon drums, with contents unknown, were also sampled and subjected to a toxicity characteristic leaching procedure (TCLP) analyses. Triplicate field quality control (QC)/quality assurance (QA) samples were collected as well. The primary and blind duplicate QC samples were sent to the primary laboratory and the QA samples were sent to the QA laboratory chosen by the USACE (see Section 2.0). Table 1 below lists the total primary and QA samples along with all the analytical procedures required for this effort.

The data was verified following the guidance of EM 200-1-6, *Chemical Quality Assurance for HTRW Projects, 10 October 1997.*

Section 2.0 - Project Organization & Responsibilities

The functional project organization and responsibilities are described in Section 3 of the Facility-Wide Sampling and Analysis Plan (SAIC, 2011b) and in the Prudent Work Plan.

Analytical support for this work has been assigned to TestAmerica, North Canton, Ohio. TestAmerica performed all required analyses at that location except for the explosives and propellant analyses, which was performed in the TestAmerica West Sacramento facility. TestAmerica's organizational structure, roles, and responsibilities are identified in Section 4.0 of their Quality Assurance Manual (QA Manual), which is available for review upon request. The address and telephone number for TestAmerica laboratories are as follows:

TestAmerica North Canton

4101 Shuffle Street NW
North Canton, Ohio 44720
Phone: 330-497-9396
Fax: 330-497-0772
www.testamericainc.com
Contact: Mark Loeb

TestAmerica West Sacramento
(samples to be analyzed for explosives/propellants will be forwarded to West Sacramento)

880 Riverside Parkway
West Sacramento, CA 95605
Phone: 916-373-5600
Fax: 916-372-1059
Contact: Karen Dahl

EMLab P & K
(For asbestos analyses)

1150 Bayhill Drive
Suite 100
San Bruno, CA 94066
Phone: 866 888-6653
POC: to be determined

USACE has selected the following QA laboratory

CT Laboratories

1230 Lange Court
Baraboo, WI 53913
Phone: 608-356-2760
POC: Pat Letterer

Data Validation will be performed by a 3rd Independent Party via USACE Louisville District:

MECx, LP

12269 East Vessar Drive
Aurora, Colorado 80014
Phone: 720 535-5502
Fax: 720 535-7555
POC : Elizabeth Wessing
Mobile: 303-881-6816
Email: Elizabeth.wessing@mecx.net

4. Comparability:				Compliance	
				N	Y
Evaluations	Agreement Between QC & QA Sample Results		Remarks. See section III		
	No*	Yes			
Volatile Organics EPA 8260B		Yes	Total xylene was detected at 26 µg/kg in sample C78SB-022V-0006-SO, and was not detected in its corresponding QA sample C78SB-023V-0006-SO All remaining samples with their corresponding QA samples were in agreements, See Tables 1-9.	X X X	
Semi-Volatile Org EPA 8270C	No		Major disagreements. See Tables 10-18.	X	
PCB: EPA 8082A		YES	See Tables 19-27: Agreements between samples of non-detect.		X
	No		Disagreements between detected levels, RPD > QC Limits.	X	
Pesticides: EPA 8081B		YES	See Tables 28-36: All samples except the followings:		X
	No		<u>Sample C78SS-003M-0001-SO</u> DDT, RPD=121 <u>Sample C78SB-22M-0002-SO</u> DDT, RPD=109 <u>Sample C78SB-22M-0004-SO</u> Methoxychlor, RPD=152 <u>Sample C78SB-22M-0101-SO</u> Methoxychlor, RPD=114	X X X X	
Explosive Residues: EPA 8330B/MOD		Yes	All samples except one. Only disagreement of two compounds In one sample C78SS-003M-0001M-SO TNT, RPD = 116 2,Amino-4,6-dinitrotoluene, RPD=66.7	 X X	X
	Choose an item.				
Metals, *EPA 6020*	No		There are major disagreements between analyte concentrations,	X	

Metals (Continued)		usually analytes determined in CT laboratories were at higher levels than those determined in TestAmerica Laboratories, and problems might be due to different grinding procedures between two laboratories.		

Acknowledgment:
I certify this review package is in compliance with the terms and conditions of the contract, both technically and for completeness other than was/were outlined in the tables above. Release of the hardcopy review data package and/or in the computer ADR/EDMS on CD has been authorized by Prudent Reviewer, as verified by the following signature.

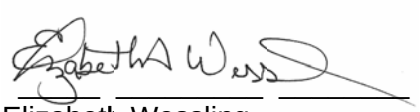
CONTRACTOR STATEMENT OF INDEPENDANT TECHNICAL REVIEW

MEC^X, LP (MEC^X) has completed the Data Validation Report for Sample Delivery Group 240-5866-1 from the Ravenna Army Ammunition Plant Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump 2011 Preliminary Assessment Sampling. Notice is hereby given that an independent technical review has been conducted to determine the usability and bias of the analytical data.

Significant concerns and the resolution are as follows:

None

As noted above, all concerns resulting from this independent technical review have been considered.



Elizabeth Wessling
Senior Environmental Chemist
MEC^X Independent Technical Review Team Leader

Patti Meeks, Ph.D.
Senior Environmental Chemist
MEC^X Independent Technical Review Team Member

EXECUTIVE SUMMARY

The overall objective of the project described in this document was to confirm the presence or absence of contamination at the Quarry Pond Surface Dump site. Sampling was conducted by Prudent Environmental Services (Prudent) in November 2011. A total of 11 primary multi-incremental (MI) samples, 7 MI field duplicate samples, 10 primary discrete samples, and 7 discrete field duplicate samples were collected.

The primary samples were analyzed by one or more of the following methods by TestAmerica-North Canton (TA-North Canton) located in North Canton, Ohio:

- United States Environmental Protection Agency (USEPA) SW-846 Method 6020 for metals
- USEPA SW-846 Methods 7471A for mercury
- USEPA SW-846 Method 8260B for volatile organic compounds (VOCs)
- USEPA SW-846 Method 8270C for semivolatile compounds (SVOCs)
- USEPA SW-846 Method 8081A for pesticides
- USEPA SW-846 Method 8082 for polychlorinated biphenyls (PCBs)

TA-North Canton subcontracted the samples to TestAmerica-West Sacramento, in West Sacramento, California, for the following analyses:

- USEPA SW-846 Method 8330B for explosive compounds
- USEPA SW-846 8330 Modified for nitroguanidine
- Laboratory procedure WS-WC-0050 for nitrocellulose, which is based on the United States Cold Regions Research and Engineering Laboratory (CRREL) method for nitrocellulose

This report details the findings of the primary sample data validation, analysis of field duplicate results, and the determination of data usability performed by MEC^X, LP (MEC^X) on the samples described above.

Additionally, 2 quality assurance soil samples were collected and submitted to CT Laboratories (CT) in Baraboo, Wisconsin. The samples were analyzed for the one or more of aforementioned analyses and the results are discussed in a separate report, *Ravenna Army Ammunition Plant Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump 2011 Preliminary Assessment Sampling Chemical Quality Assurance Report.*

Specific concerns regarding the data are noted below:

- No MRL standards were analyzed in association with the organic methods and nitrocellulose

- 1 LOD for dibenzo(a,h)anthracene exceeded the FWCUG (it should be noted that the laboratory reported estimated values to the DL)
- 1 LOD for nitroso-di-n-propylamine exceeded the FWCUG (it should be noted that the laboratory reported estimated values to the DL)
- Corrections made to the chain-of-custody by the sampler were overwritten or obliterated and none were initialed or dated
- Insufficient sample volume was provided for the VOC MS/MSDs

Some data were rejected due to matrix spike/matrix spike duplicate and laboratory control sample recovery outliers. Rejected data are not usable. Results with LODs that exceed project criteria may be usable for their intended purposes; however, it is dependent on the final data user to make this determination on a case-by-case basis. All remaining results are usable for their intended purposes as qualified by MEC^{X}.

1. INTRODUCTION

1.1 PROJECT OVERVIEW

The overall objective of the project described in this document was to confirm the presence or absence of contamination at the Quarry Pond Surface Dump site. Sampling was conducted by Prudent Environmental Services (Prudent) in November 2011. A total of 11 primary multi-incremental (MI) samples, 7 MI field duplicate samples, 10 primary discrete samples, and 7 discrete field duplicate samples were collected.

The primary samples were analyzed by one or more of the following methods by TestAmerica-North Canton (TA-North Canton) located in North Canton, Ohio:

- United States Environmental Protection Agency (USEPA) SW-846 Method 6020 for metals
- USEPA SW-846 Methods 7471A for mercury
- USEPA SW-846 Method 8260B for volatile organic compounds (VOCs)
- USEPA SW-846 Method 8270C for semivolatile compounds (SVOCs)
- USEPA SW-846 Method 8081A for pesticides
- USEPA SW-846 Method 8082 for polychlorinated biphenyls (PCBs)

TA-North Canton subcontracted the samples to TestAmerica-West Sacramento, in West Sacramento, California, for the following analyses:

- USEPA SW-846 Method 8330B for explosive compounds
- USEPA SW-846 8330 Modified for nitroguanidine
- Laboratory procedure WS-WC-0050 for nitrocellulose, which is based on the United States Cold Regions Research and Engineering Laboratory (CRREL) method for nitrocellulose

Additionally, 2 quality assurance soil samples were collected and submitted to CT Laboratories (CT) in Baraboo, Wisconsin. The samples were analyzed for the one or more of aforementioned analyses and the results are discussed in a separate report, *Ravenna Army Ammunition Plant Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump 2011 Preliminary Assessment Sampling Chemical Quality Assurance Report.*

This report describes findings of the primary sample data validation, analysis of primary/field duplicate results, and the determination of data usability performed by MEC^X, LP (MEC^X) on the site samples reported in sample delivery group (SDG) 240-5866-1 from TA-North Canton.

1.2 PREVIOUS ACTIVITIES AND DATA

The following summary was adapted from the *Facility-Wide Sampling and Analysis Plan for Environmental Investigations at the Ravenna Army Ammunition Plant, Ravenna, Ohio*

(FWQAPP) prepared by Science Applications International Corporation (SAIC), March 2001 and text provided by the United States Corps of Engineers-Louisville District.

Located in northeastern Ohio on approximately 21,000 acres, Ravenna Army Ammunitions Plant (RVAAP) was established in 1940 to load, store, and demilitarize conventional artillery ammunition, bombs, mines, fuses and boosters, primers and percussion elements. Originally RVAAP operated as two separate units, the Portage Ordnance Depot and the Ravenna Ordnance Plant. During World War II, a contractor operated the Ravenna Ordnance Depot and the government operated the Portage Ordnance Depot. Ordnance production and storage for World War II continued until August 1945, at which time the facility was renamed the Ravenna Arsenal, and the government assumed control of all operations. Then, from 1951 to 1999, the entire facility was operated by contractors. Ordnance production at the facility was phased out and sent to Plum Brook Ordnance Works in Sandusky, Ohio and Keystone Ordnance Works in Meadville, Pennsylvania. All production at the facility had ceased by 1957 and the plant was placed on standby. In 1961, the plant was operational for seven months, processing and performing explosive melt-out of bombs. After deactivation late in 1961, the facility was renamed RVAAP. From mid-1968 until 1971, the plant was reactivated to load, assemble, and pack munitions on three load lines and two component lines. Operations ceased at Load Lines 1, 2, 3, and 4 in 1971; however, the Lines were reactivated to perform demilitarization operations for several months in 1973 and 1974. In 1992, RVAAP was again placed on "Inactive" status. Salvage and demolition operations started in 1998 and administrative control of the facility was transferred to the Army National Guard (ARNGD) in 1999.

The Quarry Pond Surface Dump, CC RVAAP-78, is located in the southwestern portion of RVAAP, just north of the Fuze and Booster Quarry Landfill/Ponds area of concern. The site consists of three areas of former dumping. Two separate debris dumps, Debris Piles A and B, which comprise the Quarry Pond Surface Dump, and an additional debris pile, Debris Pile C, found at the northwest end of the northern-most pond. Debris Pile A contains transite materials, which may contain asbestos. No transite or other possible asbestos containing materials was observed in Debris Pile B or C. One rusted 55-gallon drum with unknown contents and a former burn pile are situated within Debris Pile B. A second rusted 55-gallon drum with unknown contents is present in Debris Pile C. It is possible a larger amount of construction debris and material excavated from the quarry is located between Debris Piles A and B, and may extend westward to the road along the east side of the northern-most pond.

Samples collected in association with the project described in this document were to confirm the presence or absence of contamination at the Quarry Pond Surface Dump site.

2. DESCRIPTION OF WORK PERFORMED

This section describes the data verification and data validation procedures used during the evaluation of the site samples reported in SDG 240-5866-1 from TA-North Canton.

2.1 DATA VALIDATION PROCESS

A total of 11 primary MI samples, 7 MI field duplicate samples, 10 primary discrete samples, and 7 discrete field duplicate samples were collected. Level IV validation was performed on 10% of the total number of primary samples collected. Primary samples with associated QA and field duplicate samples were prioritized for Level IV validation.

C78SB-022M-0002-SO	C78SB-021M-0002-SO
C78SB-022V-0002-SO	C78SB-021V-0002-SO

Data validators assessed results based on the *Department of Defense Quality Systems Manual for Environmental Laboratories Version 4.1* (DoD QSM), FWQAPP, the specific EPA methods, the *National Functional Guidelines for Superfund Organic Methods Data Review* (2008), and the *National Functional Guidelines for Inorganic Data Review* (2004). The following were reviewed for Level IV validation:

- Sample management (collection techniques, sample containers, preservation, handling, transport, chain-of-custody, holding times),
- Calibration data summary forms (initial and continuing),
- Method blank sample results,
- Laboratory control sample (LCS) or LCS/LCS duplicate (LCS/LCSD) recoveries and/or precision,
- Laboratory duplicate precision,

- Surrogate recoveries (if applicable),
- Matrix spike/matrix spike duplicate (MS/MSD) recoveries and precision,
- Field QA/QC sample results,
- Inductively coupled plasma (ICP) interference check sample (ICS) recoveries,
- Serial dilution precision,
- Gas Chromatography/Mass Spectrometry (GC/MS) tuning, if a GC/MS is used,
- Internal standards performance (if applicable),
- Sample results verification,
- Target compound identification,
- Raw data.

Blanks – method, calibration, trip, field and equipment – were assessed using the National Functional Guidelines 5× and 10× rules. Target compound detects less than or equal to 5× a blank detect and common laboratory contaminant compound detects less than or equal to 10× a blank detect were qualified as nondetected. Nondetected results were reported at the limit of detection (LOD) if the original detect was less than or equal to the LOD or reported at the level of contamination if the original detect was greater than the LOD.

2.2 DATA VALIDATION QUALIFIERS

Data qualifiers, as defined below, were applied following the FWQAPP and the DoD QSM:

U Nondetected at the limit of detection
The analyte was analyzed for but not definitively detected.

J Estimated
The identification of the analyte is acceptable but the quality assurance criteria indicate that the quantitative values may be outside the normal expected range of precision. Additionally used to identify detects reported below the limit of quantitation (LOQ).

N Identity Presumptive and Tentative
There is presumptive evidence that the analyte is present but it has not been confirmed. There is an indication that the reported analyte is present; however, all quality control requirements necessary for confirmation were not met.

R Rejected
Data are considered to be rejected and shall not be used for environmental decisions.

2.3 DATA VALIDATION FLAGGING CODES

The qualification codes in the following table may have been used to flag the data described in this document: Sample qualifications are summarized in Appendix B. All qualifications and associated qualification codes have been entered into the electronic data deliverables (EDD) received from the laboratories and may be reviewed in the Appendix A of this report.

Table 3. Qualification code reference table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration %RSD or %D was noncompliant.	Correlation coefficient was noncompliant.
R	Calibration RRF was noncompliant.	%R for calibration is not within control limits.
B	Presumed contamination as indicated by the preparation (method) blank results.	Presumed contamination as indicated by the preparation (method) or calibration blank results.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	ICPMS tuning was noncompliant
T	Presumed contamination as indicated by the trip blank results.	Not applicable.
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	Presumed contamination as indicated by the FB or ER results.	Presumed contamination as indicated by the FB or ER results.
$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
*II, *III	A deficiency was found that has been described in the "Sample Management," section (*II) or the "Method Analyses" section (*III).	A deficiency was found that has been described in the "Sample Management," section (*II) or the "Method Analyses" section (*III).

3. DATA ACQUISITION ACTIVITIES

3.1 SAMPLE COLLECTION

Soil samples were collected in November 2011. The samples were submitted under chain-of-custody to the primary laboratory, TA-North Canton.

Unless otherwise noted below, the chains-of-custody associated with the samples validated at Level IV were appropriately signed by both field and/or laboratory personnel with all samples and analyses accounted for, cooler custody seals intact, and within the temperature limits of 4±2°C. All documentation regarding sample handling as presented in the case narratives, chains of custody, correspondence, and sample condition upon receipt forms was evaluated with the following remaining deficiencies. No further requests were made to the primary contractor or the laboratories, and no data were qualified.

SDG	Issue
All	Corrections made to the chain-of-custody by the sampler were overwritten or obliterated and none were initialed or dated.

3.2 SAMPLE ANALYSIS

TA-North Canton, the primary laboratory, analyzed total of 11 primary MI samples, 7 MI field duplicate samples, 10 primary discrete samples, and 7 discrete field duplicate samples for one or more of the following methods.

Table 4. Analytical and preparation methods

Parameter	**Preparation Method**	**Method**
Explosives	8330B	8330B
Metals	3050B	6020
Mercury	7471A	7471A
Nitroguanidine	8330	8330M
PCBs	3540C	8082
Pesticides	3520C/3540C	8081A
Semivolatiles	3520C/3540C	8270C
Volatiles	5035	8260B
Nitrocellulose	None	WC-WS-0050

3.3 DATA COMPLETENESS

Data completeness for the project described in this report was found to be generally acceptable as no deliverables were missing.

3.4 SAMPLE PRESERVATION AND HOLDING TIME REQUIREMENTS

All method preservation requirements were met. The extraction and analytical holding times for the analyses reviewed in this document are as follows:

Table 5. Holding Times

Method	Analysis	Holding Time			
		Extraction		Analysis	
		Water	Soil	Water	Soil
6020	Metals	N/A	N/A	180 days	180 days
7471A	Mercury	N/A	N/A	28 days	28 days
8260B	VOCs	N/A	N/A	14 days	14 days
8270C	SVOCs	7 days	14 days	40 days	40 days
8081A	Pesticides	7 days	14 days	40 days	40 days
8082	PCBs	7 days	14 days	40 days	40 days
8330B	Explosives	7 days	14 days	40 days	40 days
8330 M	Nitroguanidine	7 days	14 days	40 days	40 days
WC-WS-0050	Nitrocellulose	N/A	N/A	28 days	28 days

All holding times were met.

3.6 DETECTION LIMIT REQUIREMENTS

The site specific cleanup goals (FWCUGs) for the National Guard Trainee, the Resident Adult Farmer, and the Resident Child Farmer presented in the *Final Facility-Wide Human Health Remediation Goals at the RVAAP* (2010) were compared to the limit of detection (LOD) for the nondetected analytes. As per the *Final Work Plan Addendum for 2010 Preliminary Assessment Compliance Restoration Site CC RVAAP-78 Quarry Pond Surface Dump*, if no FWCUG was listed, the USEPA most stringent USEPA Region 9 Regional Screening Levels (RSL) was utilized. It should be noted that the laboratory reported estimated values to the DL.

These LODs exceeded the FWCUGs:

- 1 dibenzo(a,h)anthracene LOD
- 1 nitroso-di-n-propylamine LOD

No LODs exceeded the Residential RSL.

The following had no FWCUG or RSL:

- 1 metal: potassium (nutrient)
- 8 pesticide compounds: alpha-chlordane, endosulfan I, endosulfan II, endosulfan sulfate, delta-BHC, endrin aldehyde, endrin ketone, and gamma-chlordane
- 2 VOCs: cis-1,3-dichloropropene, trans-1,3-dichloropropene
- 8 SVOC compounds: acenaphthylene, dimethyl phthalate, 1,3-dichlorobenzene, 2-nitrophenol, 3-nitroaniline, 3/4-methylphenol, , 4-bromophenyl phenyl ether, 4-chlorophenyl phenyl ether

Results with LODs that exceed project criteria may be usable for their intended purposes; it is dependent on the final data user to make this determination on a case-by-case basis. It should be noted that the laboratory reported estimated values to the DL.

4. DATA QUALITY EVALUATION

4.1 EXPLOSIVES

TA-West Sacramento analyzed 11 primary MI samples and 7 MI field duplicate samples for explosive compounds by USEPA SW-846 Method 8330B. MEC^X validated 2 soil samples at Level IV.

- Detection Limit (DL) studies were not evaluated as part of this project.
- Calibration
    - Initial calibration average percent relative standard deviations (%RSDs) were within the control limits listed in DoD QSM Table F-3 of ≤20%, or the linear regression r^2 values were ≥0.990.
    - The second source initial calibration verification standard (ICV) recoveries for both the primary and confirmation calibrations were within the control limits listed in DoD QSM Table F-3 of ±20%.
    - The continuing calibration verification (CCV) standard recoveries were within the control limits listed in DoD QSM Table F-3 of ±20%.
    - As per FWQAPP Section 8.3.2.1.2, low-level check standards (MRLs) are to analyzed. As no MRLs were analyzed with the samples, results less than 10× the LOQ were qualified as estimated, "J," for detects and, "UJ," for nondetects, and coded with a "C" qualification code. Results higher than 10× the LOQ were not qualified as it was the reviewer's professional opinion that at those concentrations, the CCVs were indicative of instrument performance.
- Blanks: The method blanks associated with the validated samples had no target compound detects above the control limits listed in DoD QSM Table F-3 of one-half the LOQ or one-tenth the amount detected in a sample.
- Blank Spikes and Laboratory Control Samples: The recoveries were within the control limits listed in DoD QSM Tables G-2 (poor performers) and G-13 for the listed compounds and within the reasonable laboratory control limits for nitroglycerin (84-114%) and PETN (85-115%).
- Surrogate Recovery: As no surrogate control limit was listed in the DoD QSM, surrogate recoveries were assessed against the reasonable laboratory-established control limits of 78-108%. The surrogate was recovered above the control limit at 123% in C78SS-001M-0001-SO; therefore, detects in this sample were qualified as estimated with a potential positive bias, "J+." The qualified results were coded with an "S" qualification code. All remaining surrogate recoveries were within the control limits.

- Matrix Spike/Matrix Spike Duplicate: No MS/MSD analyses were performed on the validated samples. Method accuracy was evaluated based on LCS results.

- Triplicates: No triplicate analyses were performed on the validated samples.

- Compound Identification: Compound identification was verified for those samples validated at a Level IV. Review of the sample chromatograms, standards, and retention times indicated no problems with target compound identification. Target compounds detected on the primary column were confirmed on a second column.

  The intercolumn RPDs for 4-amino-2,6-dinitrotoluene and 2,4-dinitrotoluene in sample C78SS-001M-0001-SO were 164% and 146%, respectively. Due to the size of the intercolumn RPDs, it was the reviewer's professional opinion the results should be qualified as tentatively identified, "N." The qualified results were coded with an "*III" qualification code.

- Compound Quantification and Reported Detection Limits: Compound quantification was verified for those samples validated at a Level IV. The LOQs were supported by the low point of the initial calibration and the laboratory DLs. Any result reported between the DL and the LOQ was qualified as estimated, "J." Reported nondetects are valid to the LOD.

  The intercolumn RPDs for 4-amino-2,6-dinitrotoluene and 2,4-dinitrotoluene exceeded the control limit listed in DoD QSM Table F-3 of 40%, at 164% and 146%, respectively. These results were qualified as estimated, "J," and were coded with an "*III" qualification code.

- System Performance: Review of the raw data indicated no problems with system performance.

- Manual integrations: Some manual integrations were performed to separate incompletely resolved peaks and were deemed acceptable by the reviewer.

- Field QC Samples: Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

  - Field Blanks and Equipment Rinsates: There were no equipment rinsate or field blanks collected in association with these samples.

  - Field Duplicates: There were 7 field duplicate samples analyzed for explosive compounds. The control limit listed in FWQAPP Table 3-1 of ≤50% was only applied when both sample results were ≥5× the LOQ. In cases where results were <5× the LOQ, the reasonable control limit of ± the LOQ was applied. Except as noted below, the results were within the control limits.

Table 6. Explosive field duplicate outliers

PCB field duplicate outliers				
Primary Sample	**Field Duplicate**	**Analyte**	**RPD**	**W/In LOQ**
C78SS-001M-0001-SO	C78SS-003M-0001-SO	2,4,6-Trinitrotoluene	N/A	No
		4-Amino-2,6-dinitrotoluene	N/A	No

4.2 PROPELLANTS

TA-West Sacrament analyzed 11 primary MI samples and 7 MI field duplicate samples for nitroguanidine by USEPA SW-846 Method 8330 and for nitrocellulose as nitrate/nitrite by laboratory procedure WC-WS-0050, which is based on the USCRREL method for nitrocellulose. MEC^X validated 2 soil samples at Level IV.

- DL studies were not evaluated as part of this project.
- Calibration
    - Nitroguanidine initial calibration %RSDs were within the control limits listed in DoD QSM Table F-2 of ≤20%, or the linear regression r^2 values were ≥0.990. Nitrocellulose linear regression r values were within the control limit listed in the DoD QSM Table F-11 of ≥0.995.
    - The nitroguanidine second source ICV for both the primary and confirmation calibrations were within the control limits listed in DoD QSM Table F-2 of 85-115%. The nitrocellulose ICV recoveries were within the control limits listed in DoD QSM Table F-11 of 90-110%.
    - The nitroguanidine CCV standard %Ds were within the control limits listed in DoD QSM Table F-2 of ≤15%. The nitrocellulose CCV recoveries were within the control limits listed in DoD QSM Table F-11 of 90-110%.
    - As per FWQAPP Section 8.3.2.1.2, MRLs are to analyzed. As no MRLs were analyzed with the samples, the results were qualified as estimated, "J," for detects and, "UJ," for nondetects, and coded with a "C" qualification code.
- Blanks: The method blanks associated with the validated samples had no target compound detects above the control limits listed in DoD QSM Tables F-2 and F-11 of one-half the LOQ or one-tenth the amount detected in a sample.
- Blank Spikes and Laboratory Control Samples: No nitroguanidine LCS control limits are listed in the DoD QSM. All nitroguanidine recoveries were within the laboratory-established control limits of 72-121%. The nitrocellulose recoveries were within the control limits listed in DoD QSM Table F-11 of 80-120%.
- Surrogate Recovery: A surrogate is not required for the analyses of nitroguanidine or nitrocellulose.

- Triplicates: No triplicate analyses were performed on a validated sample.

- Matrix Spike/Matrix Spike Duplicate: No MS/MSD analyses were performed on a validated sample. Method accuracy was evaluated based on LCS results.

- Compound Identification: Compound identification was verified for those samples validated at a Level IV. Review of the sample chromatogram, retention times, and spectra indicated no problems with target compound identification. As there were no primary column detects, no confirmation column analyses were performed.

- Compound Quantification and Reported Detection Limits: Compound quantification was verified for those samples validated at a Level IV. The LOQs were supported by the low point of the initial calibration and the laboratory DLs. Any result reported between the DL and the LOQ was qualified as estimated, "J." Reported nondetects are valid to the LOD.

- System Performance: Review of the raw data indicated no problems with system performance.

- Manual Integrations: No manual integrations were performed for the samples or QC reviewed at Level IV.

- Field QC Samples: Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

    - Field Blanks and Equipment Rinsates: There were no equipment rinsates or field blanks collected in association with these samples.

    - Field Duplicates: There were 7 field duplicate samples collected and analyzed for nitroguanidine and nitrocellulose. The control limit listed in FWQAPP Table 3-1 of ≤50% was only applied when both sample results were ≥5× the LOQ. In cases where results were <5× the LOQ, the reasonable control limit of ± the LOQ was applied. The results were within the control limits.

4.3 POLYCHLORINATED BIPHENYLS (PCBS)

TA-North Canton analyzed 11 primary MI samples and 7 MI field duplicate samples for PCBs by USEPA SW-846 Method 8082. MEC^X validated 2 soil samples at Level IV.

- DL studies were not evaluated as part of this project.

- Calibration: Calibration criteria listed in the DoD QSM Table F-2 were met.

    - Initial calibration average %RSDs were within the control limits of ≤20% or r^2 values ≥0.990.

- The second source ICV was within the control limit of ±20% of the true value for all applicable Aroclors.

- The CCV standard %Ds were within the control limits of ±20%.

- As per FWQAPP Section 8.3.2.1.2, MRL standards are required. As no MRLs were analyzed, results less than 10× the LOQ were qualified as estimated, "J," for detects and, "UJ," for nondetects, and coded with a "C" qualification code. Results greater than 10× the LOQ were not qualified as it was the reviewer's professional opinion that at those concentrations, the CCVs were indicative of instrument performance.

- Blanks: The method blanks had no target compound detects above the control limits listed in the DoD QSM Table F-2, of one-half the LOQ for target compounds or one-tenth the amount detected in a sample.

- Blank Spikes and Laboratory Control Samples: LCS recoveries were within the control limits listed in DoD QSM Table G-17 for soils, of 40-140% and 60-130% for Aroclors 1016 and 1260, respectively.

- Surrogate Recovery: Recoveries were within the control limits listed in DoD QSM Table G-3 of 60-125% for soils.

- Matrix Spike/Matrix Spike Duplicate: MS/MSD analyses were performed on soil sample C78SS-001M-0001-SO. Recoveries affecting sample data were within the control limits listed in DoD QSM Table G-17 for soils, of 40-140% and 60-130% for Aroclors 1016 and 1260, respectively. The RPDs were within the control limit listed in the DoD QSM Table F-2 of ≤30%.

- Compound Identification: Compound identification was verified for the validated samples. Review of the sample chromatograms, standards, and retention times indicated no problems with target compound identification. The samples were analyzed on two analytical columns for target compound confirmation.

- Compound Quantification and Reported Detection Limits: Compound quantification was verified for the samples validated at a Level IV. Sample C78SS-001M-0001-SO was analyzed at a 5× dilution for a high concentration of Aroclor 1254. The LOQs were supported by the low point of the initial calibration and the laboratory DLs. Any result reported between the DL and the LOQ was qualified as estimated, "J." Reported nondetects are valid to the LOD.

  The samples were analyzed on two analytical columns for target compound confirmation. The intercolumn RPD for Aroclor 1254 in sample C78SS-001M-0001-SO was within the control limit listed in DoD QSM table F2 of ≤40%.

- System Performance: Review of the raw data indicated no problems with system performance.

- Manual integrations were performed for some calibration and QC data associated with the sample data, primarily to correct baseline integration.

- Field QC Samples: Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

    o Field Blanks and Equipment Rinsates: The site samples in this SDG had no associated field blank or equipment rinsate samples.

    o Field Duplicates: There were 7 soil field duplicate pairs collected and analyzed for PCBs. The control limit listed in FWQAPP Table 3-1 of ≤50% was only applied when both sample results were ≥5× the LOQ. In cases where results were <5× the LOQ, the reasonable control limit of ± the LOQ was applied. Except as noted below, the results were within the control limits.

Table 7. PCB field duplicate outliers

PCB field duplicate outliers				
Primary Sample	**Field Duplicate**	**Analyte**	**RPD**	**W/In LOQ**
C78SS-001M-0001-SO	C78SS-003M-0001-SO	Aroclor-1254	N/A	No

4.4 PESTICIDES

TA-North Canton analyzed 11 primary MI samples and 7 MI field duplicate samples for pesticides by USEPA SW-846 Method 8081. MEC^X validated 2 soil samples at Level IV.

- DL studies were not evaluated as part of this project.

- Calibration: Calibration criteria listed in the DoD QSM Table F-2 were met.

    o Initial calibration %RSDs were within the control limit of ≤20%, or r^2 values ≥0.990.

    o The ICV recoveries for all target analytes were within the control limit of ±20% of the true value.

    o The DDT/Endrin breakdown standards were within the control limit listed in the DoD QSM Table F-2 of ≤15%.

    o The %Ds exceeded 20% for methoxychlor on both columns in one CCV bracketing the samples, at 28.2% and 42.9%. The detect for methoxychlor in sample C78SB-021M-0002-SO was qualified as estimated, "J," and coded with a "C" qualification code. The nondetected result in the remaining sample did not require qualification,

as the CCV responses were high. All remaining bracketing CCV %Ds affecting sample data were within the control limit of ≤20%.

- o As per FWQAPP Section 8.3.2.1.2, MRL standards are required. As no MRLs were analyzed, results less than 10× the LOQ were qualified as estimated, "J," for detects and, "UJ," for nondetects, and coded with a "C" qualification code. Results higher than 10× the LOQ were not qualified as it was the reviewer's professional opinion that at those concentrations, the CCVs were indicative of instrument performance.

- Blanks: The method blanks had no target compound detects above the control limits listed in the DoD QSM Table F-2, of one-half the LOQ or one-tenth the amount detected in a site sample.

- Blank Spikes and Laboratory Control Samples: Recoveries were within the control limits listed in the DoD QSM Table G-15.

- Surrogate Recovery: Sample C78SB-023M-0002-SO had recoveries above the control limits for TCX (70-125%) on the primary column, and DCB (55-130%) on the confirmation column, at 146% and 419%, respectively. The sample detect for methoxychlor was qualified as estimated with a potential positive bias, "J+." Remaining recoveries were within the control limits listed in the DoD QSM Table G-3.

- Matrix Spike/Matrix Spike Duplicate: MS/MSD analyses were performed on soil sample C78SS-001M-0001-SO. Five target compounds, 4,4'-DDE, 4,4'-DDT, endrin aldehyde, gamma chlordane, and methoxychlor, were recovered above the control limits in both the MS and MSD; however, none of the outliers were detected in the parent sample and no qualifications were required. Remaining recoveries were within the control limits listed in DoD QSM Table G-15 and all RPDs were within the control limit of ≤30% listed in the DoD QSM Table F-2.

- Compound Identification: Compound identification was verified for the samples validated at Level IV. Review of the sample chromatograms, standards, and retention times indicated no problems with target compound identification. The samples were analyzed on two analytical columns for target compound confirmation. The detect for methoxychlor in sample C78SB-021M-0002-SO was confirmed; however, the intercolumn RPD exceeded 100%, at 102%; therefore, the result was qualified as tentatively identified, "N," and coded with an "*III" qualification code.

- Compound Quantification and Reported Detection Limits: Compound quantification was verified for the validated samples. The LOQs were supported by the low point of the initial calibration and the laboratory DLs. Any result reported between the DL and the LOQ was qualified as estimated, "J." Reported nondetects are valid to the LOD.

The samples were analyzed on two analytical columns for target compound confirmation. The detect for methoxychlor in sample C78SB-021M-0002-SO was confirmed; however, the intercolumn RPD exceeded the control limit listed in DoD QSM table F2 of ≤40%, at 102%; therefore, the result was qualified as estimated, "J," and coded with an "*III" qualification code.

- System Performance: Review of the raw data indicated no problems with system performance.

- Manual integrations were performed for the sample and some calibration and QC data associated with the sample data, primarily to correct baseline integration.

- Field QC Samples: Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

    - Field Blanks and Equipment Rinsates: The site samples in this SDG had no associated field blank or equipment rinsate samples.

    - Field Duplicates: There were 7 soil field duplicate pairs collected and analyzed for pesticides. The control limit listed in FWQAPP Table 3-1 of ≤50% was only applied when both sample results were ≥5× the LOQ. In cases where results were <5× the LOQ, the reasonable control limit of ± the LOQ was applied. The results were within the control limits.

4.5 SEMIVOLATILE ORGANIC COMPOUNDS (SVOCS)

TA-North Canton analyzed 11 primary MI samples and 7 MI field duplicate samples for SVOCs by USEPA Method 8270C. MEC^X validated 2 soil samples at Level IV.

- DL studies were not evaluated as part of this project.

- GC/MS Tuning: The DFTPP tunes met the method abundance criteria. The samples were analyzed within 12 hours of the DFTPP injection time.

- Calibration: Calibration criteria listed in the DoD QSM Table F-4 were met for all target compounds of interest, with exceptions affecting sample data listed below.

    - Initial calibration average RRFs and ICV and CCV RRFs were within method control limits of ≥0.050 for system performance check compounds (SPCCs). All initial calibration %RSDs were within the method control limits listed in the DoD QSM Table F-4 of ≤30% for calibration check compounds (CCCs) and ≤15% for remaining compounds, or r^2 values ≥0.990.

    - The ICV recovery for 2,4-dinitrophenol was 23%; therefore, the retained result for this compound in C78SB-021M-0002-SO was qualified as estimated, "UJ." The

qualified result was coded with a "C" qualification code. All remaining second source ICV standard recoveries were within the control limit of ±20%.

- All continuing calibration %Ds affecting sample data were within the control limit of ≤20%.

- As per FWQAPP Section 8.3.2.1.2, MRL standards are required. As no MRLs were analyzed, retained results less than 10× the LOQ were qualified as estimated, "J," for detects and, "UJ," for nondetects, and coded with a "C" qualification code. Results higher than 10× the LOQ were not qualified as it was the reviewer's professional opinion that at those concentrations, the CCVs were indicative of instrument performance.

- Blanks: The method blanks had no target compound detects above the control limits listed in DoD QSM Table F-4 of one-half the LOQ for target compounds or one-tenth the amount detected in any sample, and no common laboratory contaminants.

- Blank Spikes and Laboratory Control Samples: Benzoic acid was not recovered in the LCS; therefore, results for benzoic acid in the samples were rejected, "R." The rejected results were coded with an "L" qualification code. All remaining recoveries were within the control limits listed in the DoD QSM Tables G-2 (poor performers) and G-7, or within the laboratory-established control limits when no QSM limit was prescribed.

- Surrogate Recovery: All but one surrogate was recovered below the control limit in C78SB-021M-0002-SO; therefore, all retained results were qualified as estimated, "UJ," for nondetects or, estimated with a potential negative bias, "J-" for detects. The qualified results were coded with an "S" qualification code. The surrogate recoveries for C78SS-001M-0001-SO were within the control limits listed in the DoD QSM Table G-3.

Samples qualified for surrogate recovery outliers			
Parent Sample	**Surrogate**	**%R**	**Limits**
C78SD-021M-0002-SO	2-Fluorophenol	31%	35-105
	Phenol-d5	31%	40-100
	Nitrobenzene-d5	29%	35-100
	2-Fluorobiphenyl	33%	45-105
	2,4,6-Tribromophenol	33%	35-125

- Matrix Spike/Matrix Spike Duplicate: MS/MSD analyses were performed on C78SS-001M-0001-SO. Except as noted below, the recoveries were within the control limits listed in the DoD QSM Tables G-2 (poor performers) and G-7, or within the laboratory-established control limits when no QSM limit was prescribed. All RPDs were within the control limit listed in DoD QSM Table F-4 of ≤30%.

  The parent sample result for fluoranthene was qualified as estimated with a potential negative bias, "J-." The remaining results listed in the table below were rejected, "R," as

the MS/MSD spikes were not recovered. All qualified results were coded with a "Q" qualification code.

Samples qualified for MS/MSD recovery outliers		
Parent Sample	**Analyte**	**%Rs**
C78SS-001M-0001-SO	Benzoic acid	0%, 0%
	4,6-Dinitro-2-methylphenol	0%, 0%
	2,4-Dinitrophenol	0%, 0%
	Fluoranthene	48%, 44%
	Hexachlorocyclopentadiene	0%, 0%
	3,3'-Dichlorobenzidine	0%, 0%
	2-Methylphenol	0%, 0%
	4-Nitrophenol	0%, 0%
	Pentachlorophenol	0%, 0%
	2,4,6-Trichlorophenol	0%, 0%
	4-Chloroaniline	0%, 0%

- Internal Standards Performance: The internal standard area counts and retention times were within the DoD QSM Table F-4 control limits established by the initial calibration midpoint standard: ±30 seconds for retention times and -50% / +100% for internal standard areas.

- Compound Identification: Compound identification was verified for the samples validated at Level IV. Review of the sample chromatograms, retention times, and spectra indicated no problems with target compound identification.

- Compound Quantification and Reported Detection Limits: Compound quantification was verified for the samples validated at Level IV. The LOQs were supported by the low point of the initial calibration and the laboratory DLs. Any result reported between the DL and the LOQ was qualified as estimated, "J," by the laboratory. Reported nondetects are valid to the LOD.

  C78SS-001M-0001-SO was analyzed at a 10× dilution and C78SB-021M-0002-SO was analyzed at a 4× dilution in order to report one or more analytes within the linear range of the calibration.

  Target compounds nitrobenzene, 2,4-dinitrotoluene and 2,6-dinitrotoluene were reported by both 8330B and 8270C. As the 8330B LOQs were lower than the 8270C LOQs, the results for these compounds were rejected, "R," in the 8270C analyses in favor of the 8330B results, for the samples validated at Level IV. All rejected analytes were coded with a "D" qualification code.

- System Performance: Review of the raw data indicated no problems with system performance.

- Some routine manual integrations were performed for the samples and calibration and QC data associated with the sample data. All manual integrations reviewed at Level IV were considered appropriate.

- Field QC Samples: Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

  - Field Blanks and Equipment Rinsates: There were no equipment rinsates or field blanks collected in association with these samples.

  - Field Duplicate Samples: There were 7 field duplicate samples collected and analyzed for SVOCs. The control limit listed in FWQAPP Table 3-1 of ≤50% was only applied when both sample results were ≥5× the LOQ. In cases where results were <5× the LOQ, the reasonable control limit of ± the LOQ was applied. Except as noted below, the results were within the control limits.

Table 8. SVOC field duplicate outliers

SVOC field duplicate outliers				
Primary Sample	**Field Duplicate**	**Analyte**	**RPD**	**W/In LOQ**
C78SB-021M-0002-SO	C78SB-022M-0002-SO	2-Methylnaphthalene	N/A	No
		Naphthalene	N/A	No
		Benzo(a)anthracene	59%	N/A
		Benzo(a)pyrene	71%	N/A
		Benzo(b)fluoranthene	79%	N/A
		Benzo(g,h,i)perylene	77%	N/A
		Benzo(k)fluoranthene	76%	N/A
		Chrysene	70%	N/A
		Fluoranthene	67%	N/A
		Indeno(1,2,3-cd)pyrene	79%	N/A
		Pyrene	67%	N/A
C78SS-001M-0001-SO	C78SS-003M-0001-SO	Benzo(a)anthracene	N/A	No
		Benzo(a)pyrene	N/A	No
		Benzo(b)fluoranthene	N/A	No
		Chrysene	N/A	No
		Phenanthrene	N/A	No
		Pyrene	N/A	No
		Fluoranthene	86%	N/A

4.6 VOLATILE ORGANIC COMPOUNDS (VOCS)

TA-North Canton analyzed 10 primary discrete samples and 7 discrete field duplicate samples for volatile compounds by USEPA SW-846 Method 8260B. MEC^X validated 2 primary soil samples at Level IV.

- DL studies were not evaluated as part of this project.

- GC/MS Tuning: The BFB tunes met the method abundance criteria. Samples were analyzed within 12 hours of the BFB injection time.

- Calibration: Calibration criteria listed in the DoD QSM Table F-4 were met for all target compounds of interest.

    - Initial calibration average RRFs were within the control limit of ≥0.05, and the %RSDs were within the control limit of ≤15%, or r values ≥0.995.

    - The ICV RRFs were within the control limit of ≥0.05. Recoveries for all target analytes were within the control limits of ±20% of the true value.

    - Continuing calibration RRFs were within the control limit of ≥0.05 for all target compounds, and %Ds were within the control limit of ≤20.

    - As per FWQAPP Section 8.3.2.1.2, MRL standards are required. As no MRLs were analyzed, results less than 10× the LOQ were qualified as estimated, "J," for detects and, "UJ," for nondetects, and coded with a "C" qualification code. Results higher than 10× the LOQ were not qualified as it was the reviewer's professional opinion that at those concentrations, the CCVs were indicative of instrument performance.

- Blanks: The method blanks associated with the validated samples had detects below the LOQ for methylene chloride at 239(J) µg/Kg and 182(J) µg/Kg. As results for methylene chloride in both samples were below the LOQ but above the LOD, the results were qualified as nondetected, "U," at the level of contamination, and coded with a "B" qualification code. The method blanks had no other target compound detects above the control limits listed in DoD QSM Table F-4 of one-half the LOQ for target compounds and no common laboratory contaminant detects above the LOQ.

- Blank Spikes and Laboratory Control Samples: The recovery for cis-1,3-dichloropropene was below the control limits of 70-125%, at 68% in the LCS associated with sample C78SB-021V-0002-SO. The nondetected sample result for cis-1,3-dichloropropene was qualified as estimated, "UJ," and coded with an "L" qualification code. Remaining recoveries were within the control limits listed in DoD QSM Table G-5.

- Surrogate Recovery: The surrogate 4-bromofluorobenznee was recovered below the control limits of 85-120% in both samples C78SB-021V-0002-SO and C78SS-002-0001-SO, at 80% and 67%, respectively. D8-toluene was also recovered below the control limits of 85-115% in sample C78SS-002-0001-SO, at 72%. Separate analyses for 2-butanone and 2-hexanone also had recoveries below the control limits for both BFB and d8-toluene in sample C78SS-002-0001-SO, indicating a matrix effect on the surrogates. The reanalysis of sample C78SB-021V-0002-SO for 2-butanone and 2-hexanone had acceptable surrogate recoveries; therefore, those compounds required no qualification in that sample. All other results were qualified as estimated, "J," for detects and "UJ,"

for nondetects in both samples. Qualified results were coded with an "S" qualification code. Remaining recoveries were within the control limits listed in DoD QSM Table G-3 or within laboratory-established control limits for those not listed in Table G-3.

- Matrix Spike/Matrix Spike Duplicate: MS/MSD analyses were not performed on a validated sample in this SDG, due to insufficient sample volume. Evaluation of method accuracy was based on LCS results.

- Internal Standards Performance: The internal standard area counts and retention times were within the DoD QSM Table F-4 control limits established by the initial calibration midpoint standard: ±30 seconds for retention times and -50%/+100% for internal standard areas.

- Compound Identification: Compound identification was verified for the samples validated at Level IV. Review of the sample chromatograms, retention times, and spectra indicated no problems with target compound identification.

- Compound Quantification and Reported Detection Limits: Compound quantification was verified for the samples validated at Level IV. The LOQs were supported by the low point of the initial calibration and the laboratory DLs. Any result reported between the DL and the LOQ was qualified as estimated, "J." Reported nondetects are valid to the LOD.

- System Performance: Review of the raw data indicated no problems with system performance.

- Manual integrations were not performed for the samples validated at Level IV or the associated calibration or QC.

- Field QC Samples: Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

    - Trip Blanks: Trip blanks are not required to accompany soil samples.

    - Field Blanks and Equipment Rinsates: The site samples in this SDG had no associated field blank or equipment rinsate samples.

    - Field Duplicates and Field Split Samples: There were 7 soil field duplicate pairs collected and analyzed for VOCs. The control limit listed in FWQAPP Table 3-1 of ≤50% was only applied when both sample results were ≥5× the LOQ. In cases where results were <5× the LOQ, the reasonable control limit of ± the LOQ was applied. The results were within the control limits.

4.7 METALS

TA-North Canton analyzed 11 primary MI samples and 7 MI field duplicate samples for metals by USEPA Methods 6020 and 7471A. MEC^X validated 2 primary soil samples at Level IV.

- DL studies were not evaluated as part of this project.
- Calibration: Except as noted below, calibration criteria were met.
    - Initial calibration: Linear regression r-values were within the control limit listed in the DoD QSM Tables F-7 and F-8 of ≥0.995.
    - The ICV recoveries were within the control limits listed in DoD QSM Table F-8 of 90-110%. The mercury ICV and CCV recoveries were within the control limits listed in DoD QSM Table F-7 of 90-110% and 80-120%, respectively.
    - The laboratory analyzed CRDL standards that were at the LOQ. The recoveries were within the control limits listed in DoD QSM Tables F-7 and F-8 of 80-120%.
- Blanks: The method blanks and CCBs had no applicable detects above the control limit listed in DoD QSM Tables F-7 and F-8 of one-half the LOQ or one-tenth the amount detected in a sample.
- Interference Check Samples: ICP and ICPMS interference check sample A (ICSA) and AB (ICSAB) recoveries were within the control limits listed in DoD QSM Table F-8 of 80-120%. No analytes were detected in the ICSA above the control limit listed in DoD QSM Table F-8 of <LOD.
- Blank Spikes and Laboratory Control Samples: The recoveries were within the control limits listed in DoD QSM Table G-19 of 80-120%.
- Laboratory Duplicates: Laboratory duplicate analyses were performed on C78SS-007M-0001-SO. Except for antimony, the laboratory duplicate RPDs were within the control limits listed in DoD QSM Tables F-7 and F-8 of ≤20%. The duplicate criterion was only applied when the original sample result was nominally ≥5× the LOQ. In cases where the original sample result was <5× the LOQ, the reasonable control limit of ± the LOQ was applied. The antimony results were outside of the ±LOQ control limit; therefore, both sample results for antimony were qualified as estimated, "J," and were coded with an "E" qualification code.
- Matrix Spike/Matrix Spike Duplicate: A matrix spike analysis was performed on C78SS-007M-0001-SO. Except as noted below, recoveries were within the control limits listed in DoD QSM Table G-19 of 80-120%. Matrix spike control limits were not applied when the native sample concentration exceeded the spiked amount by a factor of four or more.

The results noted in the table below, all detects, were qualified as estimated with a potential negative bias, "J-," for detects. All qualified results were coded with a "Q" qualification code. As per the National Functional Guidelines, all samples of the same matrix in an SDG were qualified for a matrix spike recovery outlier.

Samples qualified for matrix spike recovery outliers			
Parent Sample	**Analyte**	**%R**	**Qualified Samples**
C78SS-007M-0001-SO	Antimony	20%	C78SS-001M-0001-SO, C78SB-021M-0002-SO
	Calcium	41%	
	Copper	57%	
	Selenium	74%	

- Serial Dilution: Serial dilution analyses were performed on C78SS-007M-0001-SO. The %Ds for barium and lead exceeded the control limit at 11% and 19%, respectively; therefore the results for these analytes were qualified as estimated with a potential negative bias, "J-." The qualified results were coded with an "A" qualification code. The remaining serial dilution %Ds were within the control limit listed in DoD QSM Table F-8 of ≤10%. The serial dilution control limit is only applicable when the original sample concentration is minimally ≥50× the DL for ICP analytes and ≥25× the DL for mercury.

- Sample Result Verification: For Level IV validation, calculations were verified and the sample results reported on the sample result summary were verified against the raw data. Any result reported between the DL and the LOQ was qualified as estimated, "J." Reported nondetects are valid to the LOD.

- Manual Integrations: No manual integrations were noted in the mercury analyses.

- Field QC Samples: Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

    - Field Blanks and Equipment Rinsates: There were no equipment rinsates or field blanks collected in association with these samples.

    - Field Duplicate Samples: There were 7 field duplicate samples collected and analyzed for metals. The control limit listed in FWQAPP Table 3-1 of ≤50% was only applied when both sample results were ≥5× the LOQ. In cases where results were <5× the LOQ, the reasonable control limit of ± the LOQ was applied. Except as noted below, the results were within the control limits.

Table 9. Metals field duplicate outliers

Metals field duplicate outliers				
Primary Sample	**Field Duplicate**	**Analyte**	**RPD**	**W/In LOQ**
C78SB-021M-0002-SO	C78SB-022M-0002-SO	Calcium	64%	N/A
		Chromium	55%	N/A
		Lead	55%	N/A
		Potassium	N/A	No

5. DATA USABILITY

5.1 DATA USABILITY

Table 10, below, lists the number of analytes qualified for quality control outliers. A summary of the qualifications applied to the data can be found in Appendix B.

Some data were rejected for MS/MSD and LCS recovery outliers. These data are not usable. In instances where a data point had multiple results, the reviewer chose the most technically sound result to report and rejected the remaining data points. These data points rejected for multiple results do not affect data quality or usability and are not included in Table 10.

5.2 DATA COMPLETENESS

According to information provided by the USACE, all planned soil samples were collected. The field completeness for this field effort was 100%.

The analytical completeness goal established in the FWQAPP was 90% for each method. The completeness goal was met for all analyses. Data with LODs that exceeded criteria and data estimated for quality control outliers or for detects between the DL and the LOQ were included in Table 10 for informational purposes only.

Table 10. Analytical completeness for primary data

			Number of Results					
Analysis	**Samples Analyzed**	**Analytes per Sample**	**Total**	**Rejected**	**LOQs Exceeding Criteria**	**Estimated for QC Outliers**	**Estimated for Detects <LOQ**	**Percent Complete**
Explosives	2	16	32	0	0	32	2	100%
PCBs	2	7	14	0	0	14	0	100%
Pesticides	2	21	42	0	0	42	1	100%
SVOCs[1]	2	66	126	11	2	126	4	91.3%
VOCs	2	37	74	0	0	74	4	100%
Metals	2	23	46	0	0	12	9	100%
Nitroguanidine	2	1	2	0	0	2	0	100%
Nitrocellulose	2	1	2	0	0	2	1	100%
Totals			**338**	**11**	**2**	**304**	**21**	**96.7%**

[1]Results rejected as duplicate data do not appear in the total analyte count

6. CONCLUSIONS AND RECOMMENDATIONS

6.1 PRIMARY AND FIELD DUPLICATE SAMPLE COMPARISON SUMMARY

Primary and field duplicate sample comparisons were considered to be in good agreement as only 7.6% of the data had field duplicate results exceeding the criteria listed in the FWQAPP of 50% or +/- the LOQ for results below the 5× the LOQ. Most outliers were for SVOCs. For both sets of SVOC field duplicate pairs, the samples were analyzed at different dilutions. The increased variability in diluted sample results and soil heterogeneity may be partially responsible for the outliers.

Table 11. Primary/field duplicate sample comparison summary

Method	Number of Analytes	Primary/Field Duplicate Pairs	Total Analyte	Number of results within control limits	Number of results above control limit
Explosives	16	2	32	30	2
PCBs	7	2	14	13	1
Pesticides	21	2	42	42	0
SVOCs[1]	66	2	115	97	18
VOCs	37	2	74	74	0
Metals	23	2	46	42	4
Nitroguanidine	1	2	2	2	0
Nitrocellulose	1	2	2	2	0

[1]Results rejected as duplicate data do not appear in the total analyte count

6.2 SPECIFIC DATA CONCERNS

Specific concerns regarding the data are noted below:

- No MRL standards were analyzed in association with the organic methods and nitrocellulose
- 1 LOD for dibenzo(a,h)anthracene exceeded the FWCUG (it should be noted that the laboratory reported estimated values to the DL)
- 1 LOD for nitroso-di-n-propylamine exceeded the FWCUG (it should be noted that the laboratory reported estimated values to the DL)
- Corrections made to the chain-of-custody by the sampler were overwritten or obliterated and none were initialed or dated.
- Insufficient sample volume was provided for the VOC MS/MSDs

In order to avoid repetition of the issues noted above, the following actions should be taken:

- MEC^X recommends the contractor be requested to review their chain-of-custody procedures.

- MEC^X recommends that the MRL standard requirement be listed in the laboratory's statement of work.

- MEC^X recommends the sampler collect sufficient volume for all requested analyses, including MS/MSD.

APPENDIX A

Qualified Sample Result Forms

Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration %RSD or %D was noncompliant.	Correlation coefficient was noncompliant.
R	Calibration RRF was noncompliant.	%R for calibration is not within control limits.
B	Presumed contamination as indicated by the preparation (method) blank results.	Presumed contamination as indicated by the preparation (method) or calibration blank results.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	ICPMS tuning was noncompliant
T	Presumed contamination as indicated by the trip blank results.	Not applicable
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	Presumed contamination as indicated by the FB or ER results.	Presumed contamination as indicated by the FB or ER results.
$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
*II, *III	A deficiency was found that has been described in the "Sample Management," section (*II) or the "Method Analyses" section (*III).	A deficiency was found that has been described in the "Sample Management," section (*II) or the "Method Analyses" section (*III).

APPENDIX D

Validator Checklists

POLY CHLORINATED BIPHENYLS (PCB/AROCLORS) CHECKLIST

Project Name: Ravenna/Quarry Pond

Laboratory: TA-N. Canton

Batch Number(s): 23899

Sample Delivery Group: 240-58666-1

	Yes	No
1. Holding Time:		
(a) Were samples extracted within holding time?	[✓]	[ ]
(b) Were samples analyzed within holding time?	[✓]	[ ]
2. Initial Calibration:		
• Did the initial calibration consist of five standards?	[✓]	[ ]
• Did Aroclors 1016 and 1260 meet the RSD ≤ 20% or the r ≥ 0.99? avg.	[✓]	[ ]
• Was manual integration "M" performed? If the answer is "Yes", check for supporting documents.	[✓]	[ ]
• Was the manual integration necessary?	[✓]	[ ]
If the answer is "no", contact the laboratory inquiring about the reasons behind the manual integration, and **inform the District Chemist immediately if there were no valid reasons.**		
3. QCMDL:		
• Was MDL Check performed?	[ ]	[✓]
4. QCMRL:		
• Were QC/MRL run at the beginning and end of every daily sequence or every 12 hours?? results J or NJ/C	[ ]	[✓]
• Was the QC/MRL between 70-130% R N/A	[ ]	[ ]
5. Initial Calibration Verification (ICV):		
Is the mid level (2nd source) recovery within ~~85 - 115%~~ QSM 80-120%?	[✓]	[ ]

	Yes	No
6. Continuing Calibration Verification (CCV):		
• Was CCV conducted every 12 hours?	[✓]	[ ]
• Was Drift or D ~~≤ 15%~~ avg. ≤ 20% QSM from the initial calibration with a maximum %D < 20% for a specific compound?	[✓]	[ ]
7. Sample Analysis:		
• Was the RRT of an identified component within the retention time window created as SW-846 requires?	[✓]	[ ]
• Were samples with levels higher than the calibration range (E), diluted and re-analyzed? -41 5X	[✓]	[ ]
• Were identified Aroclors confirmed on a second GC column?	[✓]	[ ]
• Were individual Aroclor standards used to determine the pattern of the peaks? (Individual Aroclors are 1221, 1232, 1242, 1248, and 1254. Both Aroclor 1016, and 1260 can be used from the mixed calibration standards.)	[✓]	[ ]
• Was RPD of target analyte conformation ≤ 40?	[✓]	[ ]
8. Sample Quality Control:		
• Method Blanks: Were target analytes ≤ 1/2 MRL? ND	[✓]	[ ]
• LCS: Were the percent recoveries for LCS within the limits?	[✓]	[ ]
• MS/MSD: Were the percent recoveries within limits?	[✓]	[ ]
Were the RPDs within control limits?	[✓]	[ ]
• System Monitoring Compounds (Surrogates): are surrogate recoveries within QC limits?	[✓]	[ ]

9. Comments (attach additional sheets if necessary):

ORGANOCHLORINE PESTICIDES ANALYSIS CHECKLIST

Project Name: Ravenna/Quarry Pond

Laboratory: TA - N. Canton

Batch Number(s): 23899

Sample Delivery Group: 240-58666-1

	Yes	No
1. Holding Time:		
(a) Were samples extracted within holding time?	[✓]	[ ]
(b) Were samples analyzed within holding time?	[✓]	[ ]
2. DDT/Endrin Breakdown:		
• Was breakdown ≤ 15%?	[✓]	[ ]
3. Initial Calibration:		
• Did the initial calibration consist of five standards?	[✓]	[ ]
• Did all compounds meet the RSD ≤ 20% or r ≥ 0.99?	[✓]	[ ]
• Was manual integration "M" performed? If the answer is "Yes", check for supporting documents.	[✓]	[ ]
• Was the manual integration necessary? If the answer is "no", contact the laboratory inquiring about the reasons behind the manual integration, and **inform the District Chemist immediately if there were no valid reasons.**	[✓]	[ ]
4. QCMDL:		
• Was MDL Check performed?	[ ]	[✓]
5. QCMRL:		
• Were QC/MRL run at the beginning and end of every daily sequence or every 12 hours?? all results for WJ/C	[ ]	[✓]
• Was the QC/MRL between 70-130% R N/A	[ ]	[ ]

	Yes	No
6. Initial Calibration Verification (ICV):		
• Is the mid level (2nd source) recovery within 85 - 115%?	[✓]	[ ]
7. Continuing Calibration Verification (CCV):		
• Was CCV conducted every 12 hours?	[✓]	[ ]
• Was Drift or D ≤ 15% from the initial calibration with a maximum D ≤ 20% for a specific compound? methoxchlor 28.2% 42.9% J/C in -7	[ ]	[✓]
8. Sample Analysis:		
• Was the RRT of an identified component within the retention time window created as SW-846 requires?	[✓]	[ ]
• Were samples with levels higher than the calibration range (E), diluted and re-analyzed? N/A	[ ]	[ ]
• Were identified compounds confirmed on a second GC column?	[✓]	[ ]
• Was RPD of target analyte confirmation ≤ 40? methoxchlor -7 102%	[ ]	[✓]
9. Sample Quality Control:		
• Method Blanks: Were target analytes ≤ 1/2 MRL?	[✓]	[ ]
• LCS: Were the percent recoveries for LCS within the limits?	[✓]	[ ]
• MS/MSD: Were the percent recoveries within limits? those affecting sample data (T/ND)	[✓]	[ ]
Were the RPD within control limits?	[✓]	[ ]
• System Monitoring Compounds (Surrogates): are surrogate recoveries within QC limits? TCX 146 (70-125) 1° DCB 419 (55-130) 2° J/UJ s -7	[ ]	[✓]

10. Comments (attach additional sheets if necessary):

Name: L.S. Calvin

VOLATILE ORGANIC ANALYSIS CHECKLIST

Project Name: Ravenna/Quarry Pond

Laboratory: TA - N. Canton

Batch Number(s): 24100, 24114

Sample Delivery Group (SDG): 240-5866-1

	Yes	No
1. Holding Time:		
(a) Were samples preserved?	[✓]	[ ]
(b) Were samples analyzed within holding time?	[✓]	[ ]
2. Was the BFB tune performed at the beginning of each 12-hour period during which samples were analyzed?	[✓]	[ ]
3. Was mass assignment based on m/z 95?	[✓]	[ ]
4. Indicate if BFB ions abundance relative to m/z 95 base peak met the ions abundance criteria:		

m/z	Acceptance Criteria		
50	15.0 - 40.0 %	[✓]	[ ]
75	30.0 - 66.0 %	[✓]	[ ]
95	**100%, Base Peak**	[✓]	[ ]
96	5.0 - 9.0%	[✓]	[ ]
173	<2.0% of m/z 174	[✓]	[ ]
174	>50%	[✓]	[ ]
175	5.0 - 9.0% of mass 174	[✓]	[ ]
176	95.0 - 101.0% of m/z 174	[✓]	[ ]
177	5.0 - 9.0% of m/z 176	[ ]	[ ]

The relative ion abundance of m/z 95/96, m/z 174/176, and 176/177 are of critical importance.

The relative ion abundance of m/z 50 and 75 are of lower importance.

	Yes	No
5. Initial Calibration:		
• Did the initial calibration consist of five standards?	[✓]	[ ]
• Did the System Performance Check Compounds (SPCC) meet the minimum mean response factor (RF)?		
RF		
Chloromethane 0.1	[✓]	[ ]
1,1-Dichloroethane 0.1	[✓]	[ ]
Bromoform 0.1	[✓]	[ ]
Chlorobenzene 0.3	[✓]	[ ]
1,1,2,2-Tetrachloroethane 0.3	[✓]	[ ]
• Did the RSD meet the criteria ≤ 30% for each individual Calibration Check Compound (CCC)?		
1,1-Dichloroethene	[✓]	[ ]
Chloroform	[✓]	[ ]
1,2-Dichloropropane	[✓]	[ ]
Toluene	[✓]	[ ]
Ethylbenzene	[✓]	[ ]
Vinyl chloride	[✓]	[ ]
• Are the RSDs for the remaining target analytes ≤ 15% or r ≥ 0.99 with a mean RSD ≤ 15% with a maximum RSD ≤ 20%?	[✓]	[ ]
If the answer is "No", are the mean RSDs ≤ 15%?	[ ]	[✓]
• Was manual integration "M" performed?	N/A [ ]	[ ]
If the answer is "Yes", check for supporting documents.	[ ]	[ ]
• Was the manual integration necessary?	[ ]	[ ]
If the answer is "No", contact the laboratory inquiring about the reasons behind the manual integration, and **inform the District Chemist immediately if there were no valid reasons**.		
6. QCMDL:	[ ]	[✓]
• Was MDL Check performed?		
7. QCMRL:	[ ]	[✓]

	Yes	No
• Were QC/MRL run at the beginning and end of every daily sequence or every 12 hours?	[ ]	[✓]
all results J/UJ-C		
• Was the QC/MRL between 70-130% R N/A	[ ]	[ ]
• For the non-contaminants of concern was the QC/MRL between 60-140% (Sporadic Marginal Failure) ↓	[ ]	[ ]
8. Initial Calibration Verification (ICV):	[✓]	[ ]
• Is the mid level (2nd source) recovery within 80 - 120% for contaminants of concern ?		
• Is the mid level (2nd source) recovery within 60-140% for non-contaminants of concern (Sporadic Marginal Failure)?		
9. Continuing Calibration Verification (CCV):		
• Was CCV conducted every 12 hours?	[✓]	[ ]
• Did SPCC meet the RF values?	[✓]	[ ]
RF		
Chloromethane 0.1	[✓]	[ ]
1,1-Dichloroethane 0.1	[✓]	[ ]
Bromoform 0.1	[✓]	[ ]
Chlorobenzene 0.3	[✓]	[ ]
1,1,2,2-Tetrachloroethane 0.3	[ ]	[ ]
• Did the CCC meet the minimum requirements (D ≤ 20%)?	[✓]	[ ]
1,1-Dichloroethene	[✓]	[ ]
Chloroform	[✓]	[ ]
1,2-Dichloropropane	[✓]	[ ]
Toluene	[✓]	[ ]
Ethylbenzene	[✓]	[ ]
Vinyl chloride	[ ]	[ ]
• Primary Evaluation: Was the mean, Drift or D ≤ 20% from the initial calibration?	[✓]	[ ]
• Alternative Evaluation: Maximum allowable Drift/D for		

	Yes	No
each target analyte is ≤ 30% when mean D ≤ 20%? N/A	[ ]	[ ]

10. Sample Analysis:

	Yes	No
• Was the RRT of an identified component within ± 0.06 RRT units of the RRT of the standard component?	[✓]	[ ]
• Did the abundance of ions in the sample spectra agree within 30% of the major ions (> 10% of the base ion) in the standard spectra?	[✓]	[ ]
• Were the internal standard areas within the QC limits (from -50% to +200%)?	[✓]	[ ]

11. Sample Quality Control:

	Yes	No
• Method Blanks: Were target analytes ≤ 1/2 MRL?	[✓]	[ ]
Methylene chloride 239J/182J U/B @ level of contam.		
• LCS: Were the percent recoveries for LCS within the limits?	[ ]	[✓]
cis-1,3-DCP 68% (70-125) UJ/L in -8		
• MS/MSD: Were the percent recoveries within limits? N/A	[ ]	[ ]
Were the RPD within control limits? ↓	[ ]	[ ]

		Yes	No
5.0 Initial Calibration:			
• Did the initial calibration consist of five or more standards?		5-stds [ ] more [X]	[ ] [ ]
If the calibration curve consists of 5-standards, check validity of the calibration model.			
Was the linear model applied?		[X]	[ ]
• Did the followings System Performance Check Compounds (SPCC) meet the minimum mean response factor (RF)?			
	RF		
N-nitroso-di-n-propylamine	0.05	[X]	[ ]
Hexachlorocyclopentadiene	0.05	[X]	[ ]
2,4-dinitrophenol	0.05	[X]	[ ]
4-nitrophenol	0.05	[X]	[ ]
• Did the RSD meet the criteria ≤ 30% for the followings each individual Calibration Check Compound (CCC)?			
Base/Neutral Fraction:			
Acenaphthene		[X]	[ ]
1,4-Dichlorobenzene		[X]	[ ]
Hexachlorobutadiene		[X]	[ ]
Diphenylamine		[X]	[ ]
Di-n-octylphthalate		[X]	[ ]
Fluoranthene		[X]	[ ]
Benzo(a)pyrene		[X]	[ ]
Acid Fraction:			
4-Chloro-3-methylphenol		[X]	[ ]
2,4-Dichlorophenol		[X]	[ ]
2-Nitrophenol		[X]	[ ]
Phenol		[X]	[ ]
Pentachlorophenol		[X]	[ ]
2,4,6-Trichlorophenol		[X]	[ ]
• Are the RSDs for the remaining target analytes ≤ 15%?		[X]	[ ]
• If the answer is "No", are the mean RSDs ≤ 15% or r ≥ 0.99 with a mean RSD ≤ 15% with a maximum RSD ≤ 30%?		[ ] [ ]	[ ] [ ]

	Yes	No
• Was manual integration "M" performed?	[N]	[ ]
If the answer is "Yes", check for supporting documents.		
• Was the manual integration necessary?	[N]	[ ]
If the answer is "No", contact the laboratory inquiring about the reasons behind the manual integration, and **inform the District Chemist immediately if there were no valid reasons.**		

6. QCMDL:

• Was MDL Check performed?	[ ]	[N]

7. QCMRL:

• Were QC/MRL run at the beginning and end of every daily sequence or every 12 hours?	[ ]	[N]
• Was the QC/MRL between 70-130% R	[ ]	[ ]
• For the non-contaminants of concern was the QC/MRL between 50-150% (Sporadic Marginal Failure)?	[ ]	[ ]

8. Initial Calibration Verification (ICV):

	[ ]	[N]
• Is the mid level (2nd source) recovery within 70-130% for contaminants of concern ?		
• Is the mid level (2nd source) recovery within 50-150% for non-contaminants of concern (Sporadic Marginal Failure)?	[ ]	[ ]

9. Continuing Calibration Verification (CCV):

• Was CCV conducted every 12 hours?	[N]	[ ]
• Did any of SPCC meet the minimum RF values?	[N]	[ ]

		Yes	No
N-nitroso-di-n-propylamine	0.05	[X]	[ ]
Hexachlorocyclopentadiene	0.05	[X]	[ ]
2,4-dinitrophenol	0.05	[X]	[ ]
4-nitrophenol	0.05	[X]	[ ]

- Did the CCC meet the minimum requirements (D ≤ 20%) for the followings?

Base/Neutral Fraction:

Acenaphthene	[X]	[ ]
1,4-Dichlorobenzene	[X]	[ ]
Hexachlorobutadiene	[X]	[ ]
Diphenylamine	[X]	[ ]
Di-n-octylphthalate	[X]	[ ]
Fluoranthene	[X]	[ ]
Benzo(a)pyrene	[X]	[ ]

Acid Fraction:

4-Chloro-3-methylphenol	[X]	[ ]
2,4-Dichlorophenol	[X]	[ ]
2-Nitrophenol	[X]	[ ]
Phenol	[X]	[ ]
Pentachlorophenol	[X]	[ ]
2,4,6-Trichlorophenol	[X]	[ ]

- Primary Evaluation: Was Drift or D ≤ 20% calculated from the initial calibration? [X] [ ]
- Alternative Evaluation: Maximum allowable Drift/D for each target analyte is ≤ 30%. [ ] [ ]

10. Sample Analysis:

- Was the RRT of an identified component within ± 0.06 RRT units of the RRT of the standard component? [X] [ ]
- Did the abundance of ions in the sample spectra agree within 30% of the major ions (> 10% of the base ion) in the standard spectra? [X] [ ]
- Were the internal standard areas within the QC limits (from -50% to +200%)? [X] [ ]

11. Sample Quality Control:

	Yes	No
• Method Blanks: Were target analytes ≤ 1/2 MRL?	[N]	[ ]
• LCS: Were the percent recoveries for LCS within the limits?	[ ]	[N]
• MS/MSD: Were the percent recoveries within limits?	[ ]	[N]
Were the RPD within control limits?	[N]	[ ]
• System Monitoring Compounds (Surrogates): are surrogate recoveries within QC limits?	[ ]	[N]

LAND DISPOSAL RESTRICTION CERTIFICATION FORM

Generator Name Ravenna Army Ammunition Plant, OH Manifest No 8292068 JJK Page 1 of 1

The waste(s) identified below comply with the applicable treatment standards in 40 CFR 268, Subpart D and the applicable prohibition levels specified in 40 CFR 268.32 or RCRA 3004(d). The required information applicable to each waste is identified below.

☐ This shipment includes F001-F005 spent solvents, as identified on the attached sheet.
(Attach LDR Notification Form and check regulated constituents)

☐ This shipment includes F039 multisource leachate, as identified on the attached UTS\UHC Form.
(Fill out appropriate constituents)

☐ This shipment includes D001 (other than: A. High-TOC ignitables -or- B. Other ignitables that will be combusted or recovered), D002, D003 and/or D012-D043 characteristic wastes. The wastes will not be managed in CWA/CWA-equivalent/Class I SDWA systems and are identified on the attached LDR Form.

☐ This shipment includes RCRA Section 3004(d) California list wastes, as identified on the attached LDR Form.

☑ This shipment includes other restricted waste as identified below:

Manifest Line Item	Hazardous Waste No.		Subcategory	Treatability Group			
1	D008		N/A	NW*			

NW = Non-Waste Water
*(Incineration)

M L I	LIST CODES, EACH FOLLOWED BY CONFORMING CONSTITUENTS IN PARENTHESIS-ENTER "ALL" WHEN ALL MEET TREATMENT STANDARDS

I certify under penalty of law that I personally have examined and am familiar with the waste through analysis and testing or through knowledge of the waste to support this certification that the waste complies with the treatment standards specified in 40 CFR Part 268 Subpart D and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA Section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification, including the possibility of a fine and imprisonment.

WASTE MATERIAL PROFILE

Thank you for choosing Clean Water Limited (CWL) to profile and review your waste stream. Please complete this profile for each waste stream for CWL to evaluate.

Please use the tab key to toggle between fields. For more information, please use the hyperlinks included for the specific regulations or visit us at www.cleanwaterltd.com for answers to common questions asked.

C: WASTE CHARACTERIZATION:

i. COMMON NAME OF THE WASTE: **Unknown solids- seemed to be dirt, wood, squirrrel nest**

ii. GENERATING PROCESS DESCRIPTION: **Unknown origin**

iii. IS THIS WASTE (Check all that apply):

	Yes	No		Yes	No
Spent Material	☒	☐	Wastewater Treatment Sludge	☐	☒
Spill Material	☐	☒	Radioactive	☐	☒
Virgin Material	☐	☒	Biohazard	☐	☒
Labpack Material	☒	☐	Polymerizable	☐	☒
Off-Spec Product	☐	☒			

iv. IS THIS WASTE SUBJECT TO RCRA REGULATIONS:

		Yes	No
a.	Listed RCRA hazardous waste (F, K, P, U-coded), if applicable specify below	☐	☒
b.	Characteristic RCRA hazardous waste (D-coded), if applicable specify below	☐	☒

RCRA WASTE CODES	Choose an item.	Choose an item.	Choose an item.
Other codes not specified			
RCRA SOURCE CODES			
RCRA FORM CODES			

c.	If D009, is the total mercury concentration above 260 ppm?	☐	☒
d.	If a 'D' code chosen above, does the waste contain any Underlying Hazardous Constituents (UHC) above Universal Treatment Standards (UTS)?	☐	☒
e.	If yes to d. above, is the Land Disposal Restriction (LDR) included with this profile?	☐	☒
f.	Does this waste contain dioxin or furan per 40 CFR 261.31?	☐	☒

v. IS THIS WASTE SUBJECT TO ANY OF THE FOLLOWING AIR REGULATIONS:

		Yes	No
a.	40 CFR Part 61, Subpart FF (Benzene NESHAP)?	☐	☒
b.	40 CFR Part 63, Subpart F (SOCMI MACT)?	☐	☒
c.	Process wastewaters required to comply with 40 CFR Part 63.132 – 63.147? If yes, specify the applicable Subpart(s): Choose an item.	☐	☒
d.	If yes to a., b. or c. above, is the generator's certification included with this profile?	☐	☒

vi. DOES THIS WASTE CONTAIN:

	Yes	No	
Asbestos	☐	☒	☐ Friable ☐ Non-friable
Polychlorinated Biphenyls (PCBs)	☐	☒	Concentration, ppm _____
Hexavalent Chromium	☐	☒	Concentration, ppm _____
Halogenated Organic Compounds	☐	☒	Concentration, ppm _____
Volatile Organic Compounds >500 ppm	☐	☒	Concentration, ppm _____
Volatile Organic Hazardous Air Pollutants >500 ppmw (VOHAP as defined in 40 CFR Part 63, Subpart DD)	☐	☒	Concentration, ppm _____

D: COMPOSITION OF THE WASTE:
List all constituents. Total concentration must equal 100%. (Provide Material Safety Data Sheets or laboratory analysis).

Chemical/Compound	Conc.	Units	Chemical/Compound	Conc.	Units
Unknown solids	**100**	☐ ppm or ☒ %			☐ ppm or ☐ %
		☐ ppm or ☐ %			☐ ppm or ☐ %
		☐ ppm or ☐ %			☐ ppm or ☐ %
		☐ ppm or ☐ %			☐ ppm or ☐ %
		☐ ppm or ☐ %			☐ ppm or ☐ %

Composition is based on: ☒ Generator Knowledge ☐ Total/Ultimate Analysis ☒ TCLP Analysis

E: PHYSICAL DATA:

Water %	**0**	Specific Gravity	**Unknown**
Non-aqueous Liquid %	**0**	Number of Layers (Phases)	**1**
Oil %	**0**	Color	**Brown**
Emulsion %	**0**	Flash Point, °F	**>180**
Solid %	**100**	Btu/lb	**Unknown**
Gaseous %	**0**	pH	**7.65**
Chloride %	**0**		

Provide a description and intensity of waste material odors **mild**

F: PACKAGING/QUANTITY:
NON-BULK CONTAINERS: Specify (1) volume, (2) type, and (3) quantity and frequency of generation.

1)	☐ 1 gal	☐ 5 gal	☐ 15 gal	☐ 30 gal	☐ 55 gal	☐ Other _____	
2)	☒ Drum	☐ Cubic yard	☐ Box	☐ Bag	☐ Tote	☐ Other _____	
3)	Quantity **1**	Per:	☐ Month	☐ Quarter	☐ Year	☒ Once	

BULK CONTAINERS: Specify (1) bulk vessel, (2) quantity units, and (3) quantity and frequency of generation.

1)	☐ Tanker	☐ Vac truck	☐ Roll-off	☐ Dump Trailer	☐ Closed-top	☐ Open-top	
2)	☐ Gallons	☐ Pounds	☐ Yards	☐ Tons			
3)	Quantity _____	Per:	☐ Month	☐ Quarter	☐ Year	☐ Once	

G: DOT SHIPPING INFORMATION: Enter the PROPER DOT shipping name from 49 CR 172.101 table.
Non Regulated Waste

Hazard Class _____ UN/NA Code _____ PG _____ RQ: ☐ Yes ☐ No CLIN: _____

H: ATTACHMENTS: If attachments added, please specify the name of each document attached:
TCLP Analysis Drum #2

I: CERTIFICATION:
I hereby certify that all information submitted herein and all attachments are complete and accurate. All known and suspected hazards associated with this waste stream have been disclosed on this profile.

LAND DISPOSAL RESTRICTION CERTIFICATION FORM

Generator Name Ravenna Army Ammunition Plant, OH Manifest No 8292068 JJK Page 1 of 1

The waste(s) identified below comply with the applicable treatment standards in 40 CFR 268, Subpart D and the applicable prohibition levels specified in 40 CFR 268.32 or RCRA 3004(d). The required information applicable to each waste is identified below.

☐ This shipment includes F001-F005 spent solvents, as identified on the attached sheet.
(Attach LDR Notification Form and check regulated constituents)

☐ This shipment includes F039 multisource leachate, as identified on the attached UTS\UHC Form.
(Fill out appropriate constituents)

☐ This shipment includes D001 (other than: A. High-TOC ignitables -or- B. Other ignitables that will be combusted or recovered), D002, D003 and/or D012-D043 characteristic wastes. The wastes will not be managed in CWA/CWA-equivalent/Class I SDWA systems and are identified on the attached LDR Form.

☐ This shipment includes RCRA Section 3004(d) California list wastes, as identified on the attached LDR Form.

☑ This shipment includes other restricted waste as identified below:

Manifest Line Item	Hazardous Waste No.		Subcategory	Treatability Group			
1	D008		N/A	NW*			

NW = Non-Waste Water
*(Incineration)

MLI	LIST CODES, EACH FOLLOWED BY CONFORMING CONSTITUENTS IN PARENTHESIS-ENTER "ALL" WHEN ALL MEET TREATMENT STANDARDS

I certify under penalty of law that I personally have examined and am familiar with the waste through analysis and testing or through knowledge of the waste to support this certification that the waste complies with the treatment standards specified in 40 CFR Part 268 Subpart D and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA Section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification, including the possibility of a fine and imprisonment.

Appendix K – Fuze and Booster GW Data

Notes for all tables without a table-specific legend:

NS = no standard
NT = not tested
All inorganics are filtered, all organics are not filtered
* There are no background levels for organic constituents
J = estimated result. Results have been qualified "J"
B = organic or inorganic analysis when the analyte is found in the method blank or any of the field blanks
R = Rejected data
U = analyzed but not detected at or above the reporting limit
Bold = inorganic constituent detected above Facility-Wide background levels
Italics = inorganic constituent detected below the Facility-Wide background levels
Shaded boxes indicate any constituent, which does not have a background value, detected above the reporting limit.

Appendix L – Automated Data Review Report

(Provided in the attached CD)

Prudent Technologies, Inc. Saturday, February 23, 2013

8374 Cypresswood Dr.

Cincinnati, Ohio 45249

ATTN: Mr. John Jent, MS, PE

SUBJECT: Ravenna CC-78

Dear Mr. John Jent, MS, PE

Enclosed are all pertinent ADR reports for the laboratory electronic data deliverables (EDDs) and test categories listed below.

SDG	Fraction
240-5866-1	**Metals** (7471A) **Semi-volatiles** (8081A, 8082, 8270C, 8330) **Volatiles** (8260B)

The following deliverables are submitted under this report.

SDG Sample Summary
ADR Qualifier Summary
ADR Outlier Reports

Data review was performed in accordance with the following documents:

QSM v 4 May 2009

Please feel free to contact us if you have any questions.

Sincerely,

Samir Mansy,

Appendix M – Chemical Results for ISM Samples for the Burn Area, Debris Piles A, B, and C

Table M-1. Results for Metals in Soil Samples from Burn Area

		Location	Burn Area	
		Sample ID	C78SS-015M-0001-SO	
		Type Sample	Primary	
		Sample Date	11/10/2011	
		Sample Depth (Ft)	0 - 1	
Analyte		Units	Value	Q
Metals	Aluminum	mg/kg	6,300	
	Antimony	mg/kg	3.8	
	Arsenic (0-1')	mg/kg	14	
	Barium	mg/kg	420	
	Beryllium	mg/kg	0.6	
	Cadmium	mg/kg	3.4	
	Calcium*	mg/kg	2,800	
	Chromium	mg/kg	1,200	
	Cobalt	mg/kg	12	
	Copper	mg/kg	12,000	
	Iron*	mg/kg	52,000	
	Lead	mg/kg	450	
	Magnesium*	mg/kg	2,100	
	Manganese	mg/kg	640	
	Nickel	mg/kg	400	
	Potassium*	mg/kg	1,000	
	Selenium	mg/kg	2.3	J
	Silver	mg/kg	1.2	
	Sodium*	mg/kg	130	J
	Thallium	mg/kg	1.9	U
	Vanadium	mg/kg	4.8	U
	Zinc	mg/kg	5,300	
	Mercury	mg/kg	0.22	

Table M-2. Results for Explosives in Soil Samples from Burn Area

		Location	Burn Area	
		Sample ID	C78SS-015M-0001-SO	
		Type Sample	Primary	
		Sample Date	11/10/2011	
		Sample Depth (Ft)	0 - 1	
Analyte		Units	Value	Q
Explosives and Propellants	1,3,5-Trinitrobenzene	mg/kg	0.065	J
	1,3-Dinitrobenzene	mg/kg	0.097	U
	2,4,6-Trinitrotoluene	mg/kg	0.32	J
	2,4-Dinitrotoluene	mg/kg	0.03	J
	2,6,-Dinitrotoluene	mg/kg	0.097	U
	2-Amino-4,6-dinitrotoluene	mg/kg	1.7	J+
	2-Nitrotoluene	mg/kg	0.097	U
	3-Nitrotoluene	mg/kg	0.097	U
	4-Amino-2,6-dinitrotoluene	mg/kg	0.83	J+
	4-Nitrotoluene	mg/kg	0.097	U
	RDX	mg/kg	0.097	U
	Tetryl	mg/kg	0.097	U
	Nitrobenzene	mg/kg	0.097	U
	Nitroglycerin	mg/kg	0.24	U
	HMX	mg/kg	0.097	U
	PETN	mg/kg	0.24	U
	Nitroguanadine	mg/kg	0.04	U
	Nitrocellulose	mg/kg	2.2	J
Asbestos				
	Considered as asbestos-containing material (ACM) if the material contains >1% of asbestos.		ND	

Table M-3. Results for SVOCs in Soil Samples from Burn Area

		Location	Burn Area	
		Sample ID	C78SS-015M-0001-SO	
		Type Sample	Primary	
		Sample Date	11/10/2011

Subject: Ohio EPA's Review of Army's Draft Site Inspection Report, CC-RVAAP-78 Quarry Pond Surface Dump

Dear Mr. Leeper:

The Ohio Environmental Protection Agency (Ohio EPA) has reviewed the Draft Revised Site Inspection for CC RVAAP-78 Quarry Pond Surface Dump. The document was received by this office on June 15, 2016. It was originally prepared by Prudent Technologies, Inc. under contract no. W912QR-10-P-0052, but due to the expiration of that contract, it was revised and re-written by the US Army Corps of Engineers.

Ohio EPA has the following comment:

1. Section 6.3, pp. 65 and 66: The report identifies thallium as contamination in Debris Piles A and C in surface soil. According to Table 6-1 (Debris Pile A), the maximum detection for thallium was 0.1J mg/kg. According to Table 6-2 (Debris Pile C) the maximum detection was 0.15J mg/kg. The background criteria (for surface soil) is 1.2 mg/kg and the facility-wide cleanup goal (FWCUG) is 0.612 for Resident Child and 4.76 for Resident Adult.

   Action Item: Please clarify why thallium is a contaminant for this site when the maximum detection is lower than both background and the FWCUGs and revise the report as necessary. Please also note that the Executive Summary, p. xii will need revision as well.

In an e-mail communication with Angela Schmidt on July 21, 2016, the Army provided the following response to this comment:

> *In Table 6.1 (Debris Pile A) and Table 6.3 (Debris Pile C) thallium is incorrectly identified as "contamination" but should have fallen out in the first screen (<background). Both the table and text will be corrected before finalization.*

This response is acceptable. Please revise and re-submit the document accordingly.
