14. ABSTRACT

This Remedial Investigation/Feasibility Study Report for Anchor Test Area presents physical characteristics, geology, and hydrogeology of Anchor Test Area; compiles historical and newly acquired environmental data; summarizes nature and extent of contamination in soil; evaluates contaminant fate and transport; provides human health and ecological risk assessments; identifies response actions, screening of remedial technologies and process options; develops remedial alternatives to address chemicals of concern (COCs) presenting unacceptable risk; and presents a recommended alternative to meet the remedial action objective at this AOC. Sediment and surface water are not present at this AOC. To achieve National Guard Training and an unrestricted land use scenario for soil, this report recommends implementing "Alternative 2: Attain National Guard Training and Residential Land Uses" to excavate shallow surface soil that exceeds the arsenic CUG for the National Guard Trainee at location ATAss-005M.

15. SUBJECT TERMS

CONTRACTOR STATEMENT OF INDEPENDENT TECHNICAL REVIEW

Science Applications International Corporation (SAIC) has completed the Remedial Investigation/Feasibility Study Report for Soil at the RVAAP-48 Anchor Test Area at the Ravenna Army Ammunition Plant, Ravenna, Ohio. Notice is hereby given that an independent technical review has been conducted that is appropriate to the level of risk and complexity inherent in the project. During the independent technical review, compliance with established policy principles and procedures, utilizing justified and valid assumptions, was verified. This included review of data quality objectives; technical assumptions; methods, procedures, and materials to be used; the appropriateness of data used and level of data obtained; and reasonableness of the results, including whether the product meets the customer's needs consistent with law and existing United States Army Corps of Engineers (USACE) policy.

Jed Thomas, P.E. — 12/20/10
Study/Design Team Leader — Date

Corey Pacer, P.E. — 12/20/10
Independent Technical Review Team Leader — Date

Tom Battenhouse — 12/20/10
Fate and Transport Reviewer — Date

Harry Fatkin — 12/20/10
Risk Assessment Reviewer — Date

Corey Pacer, P.E. — 12/20/10
Feasibility Study Reviewer — Date

Significant concerns and the explanation of the resolution are as follows:

Internal SAIC Independent Technical Review was conducted on the Preliminary Draft version of this document. Subsequent versions of this document (e.g., Draft and Final) incorporated changes based on the technical reviews of USACE, the Ohio Army National Guard, and the Ohio Environmental Protection Agency. Internal SAIC Independent Technical Review comments are recorded on a Document Review Record per SAIC quality assurance procedure QAAP 3.1. This Document Review Record is maintained in the project file. Changes to the report addressing the comments have been verified by the Study/Design Team Leader. As noted above, all concerns resulting from independent technical review of the project have been considered.

Jeff Dick — 12/20/10

EXECUTIVE SUMMARY

ES.1 INTRODUCTION AND SCOPE

This Remedial Investigation (RI)/Feasibility Study (FS) report addresses soil, sediment, and surface water at Anchor Test Area at the Ravenna Army Ammunition Plant (RVAAP). Anchor Test Area is designated as area of concern (AOC) RVAAP-48. This document was prepared by Science Applications International Corporation (SAIC) under the United States Army Corps of Engineers (USACE), Louisville District, Multiple Award Remediation Contract (MARC) W912QR-04-D-0028, Delivery Order No. 0001, entitled 2008 Performance Based Acquisition (PBA) for Environmental Investigation and Remediation at RVAAP. This RI/FS report was prepared in accordance with the Ohio Environmental Protection Agency (Ohio EPA) *Director's Final Findings and Orders* (DFFO) for RVAAP, dated June 10, 2004, and conforms with Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and National Contingency Plan (NCP) requirements.

This RI/FS report for Anchor Test Area presents the following:

- A description of the operational history and environmental setting for the AOC.
- A summary of the field activities and results of the Performance Based Acquisition 2008 Remedial Investigation (PBA08 RI) conducted from February 2010 through April 2010 at the AOC.
- A description of the nature and extent of contamination, including the identification of site-related contaminants (SRCs) by screening all eligible data against the background concentration, essential human nutrients, and frequency of detection/weight-of-evidence (WOE) screening.
- An evaluation of contaminant fate and transport by identifying contaminant migration chemicals of potential concern (CMCOPCs) and contaminant migration chemicals of concern (CMCOCs) that may pose a future threat to groundwater.
- A human health risk assessment (HHRA) to identify COCs and an ecological risk assessment (ERA) to identify chemicals of potential ecological concern (COPECs).
- Conclusions of the RI report, including the identification and extent of chemicals of concern (COCs), which form the basis for conducting the FS.
- Identification of the remedial action objective (RAO) for contaminated media at the AOC.
- Identification of applicable or relevant and appropriate requirements (ARARs).

- Identification of general response actions (GRAs) and screening of a range of remedial technologies to reduce risks to human health and the environment at the AOC from COCs identified in the RI report.

- Development of remedial alternatives from appropriate GRAs and remedial technologies and evaluation of alternatives against criteria specified by CERCLA.

- Conclusions of the FS and a recommended alternative.

Surface water and sediment, as defined by RVAAP guidelines, are not present on the AOC. Groundwater is not specifically evaluated in this RI/FS report; groundwater monitoring wells are not present at the AOC and data are not available. Groundwater will be evaluated (including risk assessment) as an individual AOC for the entire facility (designated as RVAAP-66) and addressed in a separate report. This RI/FS report includes modeling to evaluate the potential for soil contaminants to leach to, and migrate in, groundwater to determine whether soil remedial actions to protect groundwater may be necessary.

ES.2 AOC DESCRIPTION

Anchor Test Area is located in the south-central portion of RVAAP, west of Wilcox-Wayland Road, south of Newton Falls Road, and north of South Service Road. Although operational information about Anchor Test Area is relatively limited, the AOC was used for research, development, and the testing of explosively-driven soil anchoring devices. The dates of use for Anchor Test Area are unknown, although it is believed testing activities did not occur until after 1961.

Anchor Test Area encompasses approximately 0.5 acres and includes several dirt mounds with a nearby sand pit approximately 12 ft by 36 ft. Metal debris has been observed in the area. The non-operational areas of Anchor Test Area are heavily forested, and the former operational areas of the AOC are covered with trees, rough grasses, and scrub vegetation. The area immediately surrounding Anchor Test Area is forested except for a clearing approximately 500 ft south of the AOC that is occupied by a large wetland. The land within and immediately surrounding the AOC has only small topographic relief. Thus, much of the precipitation landing on this area is expected to infiltrate the soil rather than runoff. The high percentage of vegetative ground cover at the AOC helps increase infiltration and decrease erosion.

Anchor Test Area is currently inactive; however, the Ohio Army National Guard (OHARNG) projected future land use, based on the anticipated training mission and utilization of Camp Ravenna Joint Military Training Center (Camp Ravenna), is dismounted military training with digging.

ES.3 FINDINGS AND RECOMMENDATIONS OF THE REMEDIAL INVESTIGATION

Quality assured sample data were collected during the Characterization of 14 AOCs [as documented in the *Characterization of 14 AOCs at the Ravenna Army Ammunition Plant* (MKM 2007)] in 2004 and the PBA08 RI in 2010. The 2004 samples were collected using both discrete and incremental

sampling methods (ISM). New data acquisition as part of the PBA08 RI focused on delineating the extent of chemicals identified in surface soil [0-1 ft below ground surface (bgs)] during prior investigations and characterization of subsurface soil, which had not been previously sampled. Data quality objectives (DQOs) and the scope of the PBA08 RI were outlined in the *PBA 2008 Supplemental Investigation Sampling Analysis Plan Addendum No. 1* (USACE 2009a). PBA08 RI sampling completed for Anchor Test Area included:

- Two ISM surface soil samples (ATAss-016M and ATAss-015M) from 0-1 ft below ground surface (bgs) to delineate chemicals above screening levels in previously collected samples;

- Three discrete surface soil samples (ATAss-012, ATAss-013, and ATAss-014) for chromium speciation analysis;

- Five soil borings (ATAsb-006, ATAsb-008, ATAsb-009, ATAsb-010, and ATAsb-0011) in the former operational area to collect discrete surface and subsurface soil samples; and

- One soil boring (ATAsb-007) to collect undisturbed samples for geotechnical analysis.

ES.3.1 Summary of Contaminant Nature and Extent

The RI evaluated all available data with respect to usability and identified SRCs. Figure ES-1 illustrates all sample locations deemed usable for this RI/FS report. The evaluation of contaminant nature and extent focused on identified SRCs; key findings are as follows:

- In surface soil, the highest concentrations of inorganic SRCs were observed at historical ISM sample locations ATAss-005M and ATAss-001M and at PBA08 RI sample locations ATAss-015M and ATAss-016M. These samples also contained the greatest number of inorganic SRCs per sample above background concentrations. Four semi-volatile organic compounds (SVOCs) [2-methylnaphthalene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate, and naphthalene] were identified as SRCs at the AOC; three of these SVOCs occurred at sample location ATAss-015M. No explosives, propellants, volatile organic compounds (VOCs), pesticides, or polychlorinated biphenyls (PCBs) were detected in surface soil.

- In subsurface soil, detectable concentrations of cadmium and silver were ubiquitous, although no spatial or vertical trends were evident. Both metals occurred within a narrow range of concentrations. One SVOC [bis(2-ethylhexy)phthalate] and two VOCs (methylene chloride and toluene) were detected in subsurface soil samples collected at location ATAsb-008. Explosives, propellants, pesticides, and PCBs were not detected in any subsurface soil sample. Unconsolidated overburden is greater than 13 ft in thickness across the AOC. Groundwater was encountered at a depth of about 10 ft bgs.

ES.3.2 Summary of Contaminant Fate and Transport

Soil screening analyses identified two SRCs (arsenic and naphthalene) with maximum soil concentrations exceeding soil screening criteria and estimated travel times to reach the water table in less than 1,000 years. These chemicals were identified as initial CMCOPCs and were evaluated using the Seasonal Soil compartment model (SESOIL). Arsenic concentrations in leachate beneath the sample area ATAss-005M were predicted to exceed the United States Environmental Protection Agency (USEPA) Safe Drinking Water Act maximum contaminant level (MCL) (0.01 mg/L) and the RVAAP facility-wide background concentration for unconsolidated groundwater (0.0117 mg/L) at a future point in time. Naphthalene was screened out based on SESOIL modeling results.

Arsenic was further evaluated using the Analytical Transient 1-, 2-, 3-Dimensional (AT123D) groundwater transport model. Based on AT123D model results, the maximum predicted concentration in groundwater beneath the source area (0.0473 mg/L) was predicted to exceed the MCL (0.01 mg/L) and the RVAAP facility-wide background concentration for unconsolidated groundwater (0.0117 mg/L) at a future point in time. The maximum predicted concentration of arsenic (0.000587 mg/L) at the downgradient receptor (wetland area approximately 200 ft to the southeast of Anchor Test Area) did not exceed the screening criteria and was eliminated as a CMCOC.

Based on soil screening analysis and the fate and transport evaluation, all SRCs identified in the surface soil and subsurface soil sample aggregates were eliminated as posing future impacts to groundwater.

ES.3.3 Summary and Conclusions of the Human Health Risk Assessment

The HHRA identified COCs and conducted risk management analysis to determine those COCs requiring evaluation in an FS based on potential risk to human receptors. The representative human receptor scenario for the HHRA is the National Guard Trainee based on the Reasonable and Anticipated Future Land Use (RAFLU) for Anchor Test Area. The risk assessment also evaluates a Resident Farmer receptor scenario to represent an unrestricted land use option. Exposure units (EUs) evaluated in the HHRA are shallow surface soil (0-1 ft bgs), deep surface soil (1-4 ft bgs) for the National Guard Trainee, and subsurface soil for the National Guard Trainee (4-7 ft bgs) and Resident Farmer (1-13 ft bgs).

Arsenic is a COC in one ISM shallow surface soil sample (ATAss-005M) for both the National Guard Trainee and the Resident Farmer receptors. No COCs occur in deep surface soil samples for the National Guard Trainee or in subsurface soil for either receptor.

ES.3.4 Summary and Conclusions of the Ecological Risk Assessment

There are four integrated soil COPECs based on the historical and current information at the Anchor Test Area: arsenic, chromium, manganese, and mercury. The number of COPECs is low. Ecological resources at Anchor Test Area were compared to the list of important ecological places and resources.

None of the 39 important places were present, and there is nothing ecologically significant at Anchor Test Area. The ERA summarizes the chemicals and resources in detail to demonstrate there is a small amount of contamination at the Anchor Test Area, but no important or significant ecological resources are present. Consequently, the ERA for Anchor Test Area concludes with a Level I Scoping Level Risk Assessment, with a recommendation of no further action (NFA) from the ecological risk perspective.

ES.3.5 Recommendations of the Remedial Investigation

Based on the RI, no further investigation is recommended for Anchor Test Area. The RI recommends proceeding to the FS phase to evaluate arsenic contamination in shallow surface soil at ISM sampling area ATAss-005M that exceeds facility-wide cleanup goals (FWCUGs) for National Guard Trainee and Resident Farmer receptors (Figure ES-1). Table ES-1 summarizes the COCs and their recommended cleanup goals (CUGs) for each evaluated future land use.

Table ES-1. Summary of COCs Identified for Evaluation in the FS

Media	Chemical of Concern	Cleanup Goal (mg/kg)
National Guard Trainee		
Shallow Surface Soil (0-1 ft bgs)	Arsenic	31[a]
Resident Farmer		
Shallow Surface Soil (0-1 ft bgs)	Arsenic	15.4[b]

[a] Cleanup goal (CUG) for arsenic in surface soil for the National Guard Trainee is the precedent CUG of 31 mg/kg from the *Interim Record of Decision for the Remediation of Soils at Load Lines 1 through 4* (USACE 2007a) and the *Record of Decision for Soil and Dry Sediment for RVAAP-12 Load Line 12* (USACE 2009b) as documented in Table 5-12 of the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a).
[b]CUG for residential land use is the facility-wide background concentration for RVAAP published in the *Phase II Remedial Investigation Report for Winklepeck Burning Grounds* (USACE 2001b) because the Facility-Wide Cleanup Goal (FWCUG) for the Resident Farmer is less than the background concentration.
bgs = below ground surface
COC = Chemical of Concern
mg/kg = milligrams per kilogram

Analyses of remedial alternatives are not warranted for subsurface soil greater than 1 ft bgs, based on the absence of human health COCs; NFA is recommended for this media. Soil remediation to protect groundwater is not warranted because: (1) contaminant leaching and fate and transport modeling results did not identify CMCOCs; and (2) groundwater has a depth greater than 5 ft bgs and is not considered an exposure medium to ecological receptors. Additionally, the ERA concluded there may be potential ecological risk but did not identify affected ecological resources associated with Anchor Test Area. As a result, the ERA recommended NFA for ecological resources.

ES.4 Summary and Recommendation of the Feasibility Study

The FS develops the RAO, identifies appropriate CUGs for remedial actions, identifies ARARs, screens potential remedial technologies and process options, and develops and evaluates remedial alternatives.

ES.4.1 Remedial Action Objective and Cleanup Goals

The RAO for Anchor Test Area is to prevent: (1) National Guard Trainee exposure to identified COCs in soil above CUGs; (2) adverse ecological effects from previous AOC activities; and (3) negative groundwater impacts from contaminant migration from source media (e.g., soil).

The most likely foreseeable land use for the AOC is National Guard Training. A Residential Land Use provides a baseline for evaluating whether the AOC may be eligible for unrestricted future use. In either land use, arsenic was identified as the only COC for remediation based on the HHRA and guidelines provided in the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a) (herein referred to as the FWCUG Report). The National Guard Trainee FWCUG for arsenic in shallow surface soil is 31 mg/kg, as documented in Table 5-12 of the FWCUG Report. The Resident Farmer FWCUG for arsenic in shallow surface soil (4.25 mg/kg) is lower than the facility-wide background concentration (15.4 mg/kg). Therefore, the facility-wide background concentration is the CUG for the Resident Farmer, is protective for the National Guard Trainee, and provides the requisite level of protectiveness for unrestricted land use.

ES.4.2 Development and Evaluation of Alternatives

The FS screens remedial technologies and process options and develops the following viable remedial alternatives developed:

- Alternative 1: No Action
- Alternative 2: Attain National Guard Training and Residential Land Uses
  - Shallow Surface Soil (0-1 ft bgs) – Excavation with Off-site Disposal
  - Deep Surface Soil (1-4 ft bgs) – NFA
  - Subsurface Soil (1-13 ft bgs) – NFA

The No Action alternative, required for evaluation under the NCP, provides the baseline against which other remedial alternatives are compared. This alternative assumes all current actions (e.g., access restrictions and environmental monitoring) are discontinued and assumes no future actions take place to protect human receptors or the environment. Removal or treatment of COCs at the AOC will not be implemented.

Alternative 2 will remove shallow surface soil (0-1 ft bgs) exceeding the arsenic CUG for the Resident Farmer (15.4 mg/kg) at sampling location ATAss-005M. Soil will be disposed off-site at an approved, licensed facility. The extent of the excavation is depicted on Figure ES-1 and the estimated total disposal volume (i.e., ex situ) is approximately 14 yd^3. Backfilling and restoration of the excavated area will be conducted in accordance with RVAAP requirements. This alternative does not require land use controls (LUCs) or five-year reviews as it attains a requisite level of protectiveness for unrestricted use.

The FS evaluates alternatives with respect to CERCLA threshold and balancing criteria and presents a comparative analysis to justify the selection of a recommended alternative. Table ES-2 summarizes the comparative analysis of the alternatives.

ES.4.3 Recommended Alternative

The recommended alternative for Anchor Test Area is Alternative 2: Attain National Guard Training and Residential Land Uses. Shallow surface soil (0-1 ft bgs) at location ATAss-005M will be excavated by mechanical equipment and disposed off-site in an approved, licensed facility. Confirmation samples will be collected along excavation sidewalls using ISM to verify the extent of excavation is below the CUG or if further lateral removal of soil is required. If the excavation extends to a previously sampled ISM sampling area that had a concentration less than the CUG (e.g., ATAss-016M), excavation will stop and confirmation sampling on the corresponding sidewall will not be required. The excavated areas will be backfilled with clean soil from an Ohio EPA-approved off-site source, re-vegetated using OHARNG-approved native seed mixtures, and mulched. Assuming removal beyond the extent of ATAss-005M is not needed, the estimated cost for the alternative is $93,967. Successful implementation of the alternative attains a requisite level of protectiveness for soil for unrestricted land use (e.g., National Guard Trainee and Resident Farmer). Therefore, LUCs and five-year reviews will not be required following the remedy.

Table ES-2. Summary of Comparative Analysis of Remedial Alternatives

NCP Evaluation Criteria	**Alternative 1: No Action**		**Alternative 2: Attain National Guard Training and Residential Land Uses**	
Threshold Criteria	***Result***		***Result***	
1. Overall Protectiveness of Human Health and the Environment	Not protective		Protective	
2. Compliance with ARARs	Compliant		Compliant	
Balancing Criteria	***Ranking***	***Score***	***Ranking***	***Score***
3. Long-Term Effectiveness and Permanence	Low	1	High	3
4. Reduction of Toxicity, Mobility, or Volume through Treatment	Low	1	Medium	2
5. Short-Term Effectiveness	High	3	Medium	2
6. Implementability	High	3	Medium	2
7. Cost	High	3	Medium	2
Balancing Criteria Score		*11*		*11*

"High" = highly favorable situation
"Medium" = moderately favorable situation
"Low" = situation that is not favorable
Scoring for the Balancing Criteria is as follows: High = 3, Medium = 2, Low = 1
ARAR = Applicable or Relevant and Appropriate Requirements
NCP = National Contingency Plan

THIS PAGE INTENTIONALLY LEFT BLANK.

1.0 INTRODUCTION

Science Application International Corporation (SAIC) has been contracted by the United States Army Corps of Engineers (USACE), Louisville District to provide environmental services to achieve response complete, remedy in place, or site closeout, as documented in an approved Record of Decision (ROD) for the area of concern (AOC) Anchor Test Area (designated as RVAAP-48) within the Ravenna Army Ammunition Plant (RVAAP) in Ravenna, Ohio (Figures 1-1 and 1-2). This work is being performed in accordance with USACE, Louisville District, Multiple Award Remediation Contract (MARC) W912QR-04-D-0028, Delivery Order No. 0001, under a Performance Based Acquisition (PBA).

Planning and performance of all elements of this PBA are in accordance with the requirements of the Ohio Environmental Protection Agency (Ohio EPA) *Director's Final Findings and Orders* (DFFO) for RVAAP, dated June 10, 2004 (Ohio EPA 2004). The DFFO requires conformance with Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Contingency Plan (NCP) to implement a remedial investigation (RI) to characterize the AOC, develop a feasibility study (FS) report to develop and evaluate remedial alternatives to address contamination presenting unacceptable risk to human health and the environment, present a recommended remedial alternative in a proposed plan (PP), and document stakeholder selection and acceptance of the preferred final remedy in a ROD. Figure 1-3 presents this process.

This document is a combined RI and FS report and includes:

- A description of the operational history and environmental setting for the AOC.
- A summary of the field activities and results of the Performance Based Acquisition 2008 Remedial Investigation (PBA08 RI) conducted from February 2010 through April 2010 at the AOC.
- A description of the nature and extent of contamination including the identification of site-related contaminants (SRCs) by screening all eligible data against the background concentration, essential human nutrients, and frequency of detection/weight-of-evidence (WOE) screening.
- An evaluation of contaminant fate and transport by identifying contaminant migration chemicals of potential concern (CMCOPCs) and contaminant migration chemicals of concern (CMCOCs) that may pose a future threat to groundwater.
- A human health risk assessment (HHRA) to identify chemicals of concern (COCs) and an ecological risk assessment (ERA) to identify chemicals of potential ecological concern (COPECs).
- Conclusions of the RI report, including the identification and extent of COCs, which form the basis for conducting the FS.

- Identification of the remedial action objective (RAO) for contaminated media at the AOC.

- Identification of applicable or relevant and appropriate requirements (ARARs).

- Identification of general response actions (GRAs) and screening of a range of remedial technologies to reduce risks to human health and the environment at the AOC from COCs identified in the RI report.

- Development of remedial alternatives from appropriate GRAs and remedial technologies, and evaluation of alternatives against criteria specified by CERCLA.

- Conclusions of the FS and a recommended alternative.

Based on the outcome of the evaluation in this RI/FS report, the recommended alternative will be submitted for public review and comment in a PP. Public comments will be considered in the final selection of a remedy, which will be documented in a ROD.

1.1 PURPOSE

The purpose of the PBA08 RI at Anchor Test Area is to supplement the data from previous sampling events to delineate the nature and extent of contamination, evaluate contaminant fate and transport, and complete an HHRA and ERA to support remedial decisions. Depending on the results of the RI, a recommendation is provided for either no further action (NFA) or an FS to evaluate potential remedies and future actions. The purpose of the FS is to identify the RAO and appropriate cleanup goals (CUGs), screen remedial technologies, develop remedial alternatives to meet the RAO and attain CUGs, and perform a detailed evaluation of remedial alternatives to identify a recommended remedy.

1.2 SCOPE

The scope of this RI/FS report is to present (1) the nature and extent of contamination, fate and transport of chemicals in the environment, and risk assessments for surface and subsurface soil at the AOC; (2) the results of the evaluation of remedial alternatives for meeting the RAO for any COCs identified in these media at the AOC; and (3) a recommendation for either NFA or a recommended alternative to present to the public in a PP. If remedial actions are warranted, the recommended alternative will achieve required risk reductions to protect human health and the environment and attain all ARARs. In accordance with CERCLA, remedial alternatives are to be cost effective; use permanent solutions and alternative treatment technologies to the maximum extent practicable; and satisfy the preference for treatment that reduces volume, toxicity, or mobility to the maximum practical extent.

For the purposes of this report, the term “surface soil” includes dry sediment. Dry sediment refers to unconsolidated inorganic and organic material within conveyances, ditches, or low-lying areas that

occasionally may be covered with water, usually following a precipitation event or due to snowmelt. Dry sediment is not covered with water for extended periods and typically is dry within seven days of a precipitation event. Dry sediment does not function as a permanent habitat for aquatic organisms, although it may serve as a natural medium for the growth of terrestrial organisms. Dry sediment is addressed the same as surface soil [0-1 ft below ground surface (bgs)] in terms of contaminant nature and extent, fate and transport, and risk exposure models. The term "sediment," as used in this report, refers to wet sediment within conveyances, ditches, wetlands, or water bodies that is inundated for extended periods. These definitions and terminology are consistent with the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a) (herein referred to as the FWCUG Report).

Surface water and sediment, as defined by RVAAP guidelines, are not present on the AOC. Potential impacts to groundwater from soil (e.g., contaminant leaching) are evaluated in this report, as protectiveness to groundwater is included in the evaluation of remedial alternatives for these media. However, potential groundwater remedies, if required, will be assessed in a separate report. There are no extant buildings or structures at the AOC and therefore are not evaluated as continuing sources of contamination in this report.

1.3 REPORT ORGANIZATION

This RI/FS report is organized in accordance with Ohio EPA and U.S. Environmental Protection Agency (USEPA) CERCLA RI/FS guidance, as well as applicable USACE guidance. Below is a summary of the components of the report and appendices:

- Section 2.0 provides a description and history of RVAAP and the Anchor Test Area operational area.

- Section 3.0 describes the environmental setting at RVAAP and Anchor Test Area, including the geology, hydrogeology, climate, population, and ecological resources.

- Section 4.0 describes the specific RI methods used for field data collection for the PBA08 RI and the approach to analytical data management and laboratory programs.

- Section 5.0 presents the data generated during the PBA08 RI and discusses the occurrence and distribution of contamination at the AOC.

- Section 6.0 presents an evaluation of contaminant fate and transport.

- Section 7.0 includes the methods and results of the HHRA and ERA.

- Section 8.0 provides the conclusions and recommendations of the RI.

- Section 9.0 outlines the development of the RAO for the chemicals and media of concern.

- Section 10.0 summarizes potential federal and state chemical-, location-, and action-specific ARARs for the potential remedial actions.

- Section 11.0 presents GRAs and the identification and screening of technology types and process options considered for possible use in remediation.

- Section 12.0 develops remedial alternatives from technologies and process options that passed initial screening and presents an initial evaluation against effectiveness, implementability, and cost.

- Section 13.0 presents the detailed and comparative analyses of viable remedial action alternatives developed to address chemicals and media of concern using the seven criteria specified by USEPA CERCLA guidance.

- Section 14.0 summarizes the framework for conducting the necessary agency and public involvement activities.

- Section 15.0 presents the conclusions of the FS and the recommended remedial alternative.

- Section 16.0 provides a list of references used to develop this report.

Appendices:

Appendix A: Field Sampling Logs;
Appendix B: Project Quality Assurance Summary;
Appendix C: Data Quality Control Summary Report;
Appendix D: Laboratory Analytical Results;
Appendix E: Fate and Transport Modeling Results;
Appendix F: Investigation-derived Waste Management Reports;
Appendix G: Human Health Risk Assessment Tables;
Appendix H: Ecological Risk Assessment Information and Data; and
Appendix I: Detailed Cost Estimates.

2.0 BACKGROUND

2.1 FACILITY-WIDE BACKGROUND INFORMATION

2.1.1 General Facility Description

When the RVAAP Installation Restoration Program (IRP) began in 1989, RVAAP was identified as a 21,419-acre facility. The property boundary was resurveyed by Ohio Army National Guard (OHARNG) over a 2-year period (2002 and 2003) and the total acreage of the property was found to be 21,683 acres. As of June 2010, a total of 20,423 acres of the former 21,683-acre RVAAP have been transferred to the National Guard Bureau (NGB) and subsequently licensed to OHARNG for use as a military training site.

The current RVAAP consists of 1,260 acres scattered throughout the OHARNG Camp Ravenna Joint Military Training Center, herein referred to as Camp Ravenna. Camp Ravenna is in northeastern Ohio within Portage and Trumbull counties, approximately 3 miles [4.8 kilometer (km)] east-northeast of the city of Ravenna and approximately 1 mile (1.6 km) northwest of the city of Newton Falls. The RVAAP portions of the property are solely located within Portage County. RVAAP and Camp Ravenna occupy a parcel of property approximately 11 miles (17.7 km) long and 3.5 miles (5.6 km) wide bounded by State Route 5, the Michael J. Kirwan Reservoir, and the CSX System Railroad on the south; Garrett, McCormick, and Berry roads on the west; the Norfolk Southern Railroad on the north; and State Route 534 on the east (Figures 1-1 and 1-2). Camp Ravenna is surrounded by several communities: Windham on the north; Garrettsville 6 miles (9.6 km) to the northwest; Newton Falls 1 mile (1.6 km) to the southeast; Charlestown to the southwest; and Wayland 3 miles (4.8 km) to the south.

When RVAAP was operational, Camp Ravenna did not exist and the entire 21,683-acre parcel was a government-owned, contractor-operated, industrial facility. The RVAAP IRP encompasses investigation and cleanup of past activities over the entire 21,683 acres of the former RVAAP. References to RVAAP in this document indicate the historical extent of RVAAP, which is inclusive of the combined acreages of the current Camp Ravenna and RVAAP, unless otherwise specifically stated.

Former industrial operations at RVAAP consisted of 12 munitions-assembly facilities referred to as "load lines." Load Lines 1 through 4 were used to melt and load 2,4,6-trinitrotoluene (TNT) and Composition B into large-caliber shells and bombs. The operations on the load lines produced explosive dust, spills, and vapors that collected on the floors and walls of each building. Periodically, the floors and walls were cleaned with water and steam. Following cleaning, the wastewater, containing TNT and Composition B, was known as "pink water" for its characteristic color. Pink water was collected in concrete holding tanks, filtered, and pumped into unlined ditches for transport to earthen settling ponds. Load Lines 5 through 11 were used to manufacture fuzes, primers, and boosters. Potential contaminants in these load lines include lead compounds, mercury compounds,

and explosives. From 1946 to 1949, Load Line 12 was used to produce ammonium nitrate for explosives and fertilizers prior to use as a weapons demilitarization facility.

In 1950, the facility was placed on standby status and operations were limited to renovation, demilitarization, and normal maintenance of equipment, along with storage of munitions. Production activities were resumed from July 1954 to October 1957 and again from May 1968 to August 1972. In addition to production missions, various demilitarization activities were conducted at facilities constructed at Load Lines 1, 2, 3, and 12. Demilitarization activities included disassembly of munitions and explosives melt-out and recovery operations using hot water and steam processes. Periodic demilitarization of various munitions continued through 1992.

In addition to production and demilitarization activities at the load lines, other facilities at RVAAP include AOCs that were used for the burning, demolition, and testing of munitions. These burning and demolition grounds consist of large parcels of open space or abandoned quarries. Potential contaminants at these AOCs include explosives, propellants, inorganic chemicals, and waste oils. Other types of AOCs present at RVAAP include landfills, an aircraft fuel tank testing facility, and various general industrial support and maintenance facilities.

2.1.2 Demography and Land Use

RVAAP consists of 21,683 acres and is located in northeastern Ohio, approximately 23 miles (37 km) east–northeast of Akron and 30 miles (48.3 km) west–northwest of Youngstown. RVAAP occupies east–central Portage County and southwestern Trumbull County. Census projections for 2010 indicate that the populations of Portage and Trumbull counties are 161,419 and 210,312, respectively. Population centers closest to RVAAP are Ravenna, with a population of 11,724 and Newton Falls, with a population of 4,795.

The RVAAP facility is located in a rural area and is not close to any major industrial or developed areas. Approximately 55% of Portage County, in which the majority of RVAAP is located, consists of either woodland or farmland acreage. The closest major recreational area, the Michael J. Kirwan Reservoir (also known as West Branch Reservoir), is located adjacent to the western half of RVAAP south of State Route 5.

RVAAP is operated by the Base Realignment and Closure (BRAC) Division of the Army which manages the restoration activities at RVAAP. Camp Ravenna (which is located on the remainder of the property) is owned by NGB who licenses it to the OHARNG for use as a military training site. Training and related activities at Camp Ravenna include field operations and bivouac training, convoy training, equipment maintenance, C-130 aircraft drop zone operations, helicopter operations, and storage of heavy equipment.

2.2 ANCHOR TEST AREA BACKGROUND INFORMATION

2.2.1 Operational History

Anchor Test Area is approximately 0.5 acres in size and is located approximately 50-75 ft west of Wilcox-Wayland Road and 2,500 ft south of Newton Falls Road (Figure 2-1). Although operational information is relatively limited about this former research and development area used by The Firestone Tire and Rubber Company Defense Research Division, it is believed that the area was used for testing of explosives-driven soil anchoring devices. These devices were typically metal rods driven into the ground and attached via a cable to stabilize structures or anchor them to the ground. The dates of use for this AOC are unknown; however, a 1961 drawing shows the final design for the AOC; therefore, it is likely it was not active until after the early 1960s. Aerial photographs from 1966 confirm the construction of AOC features, but it is unknown whether Anchor Test Area was active at the time of the photographs.

The distinct surface features of the AOC are the former blast wall dirt mounds and a nearby sandpit. The anchor tests were likely performed within the 12 ft by 36 ft sandpit. The adjacent dirt mounds functioned as blast walls. One mound is approximately 8-10 ft in height while the others are only 1-2 ft in height. The dirt mounds are still observable, although the mounds are overgrown with vegetation and small trees. The sandpit is no longer visually distinct due to vegetative growth. Metal debris is visible in the area, and a section of cement culvert can be seen in one of the dirt mounds. Based upon the culvert's location and orientation, it is suspected the culvert was previously identified as the dirt-covered, 55-gallon, open-end drum used for powder storage in the original 1961 Anchor Test Area drawing.

Currently, the AOC is heavily overgrown with trees, shrubs, and tall grass. The immediate surrounding area is forested except for: (1) a wetland approximately 100 ft away on the east side of Wilcox-Wayland Road within a separate watershed; and (2) a wetland approximately 500 ft south within the same watershed. The wetland to the south is drained by an unnamed stream south of the west branch of the Mahoning River. As the AOC is located on the southern edge of a small topographic high, any surface water not percolating to groundwater flows south directly into the wetland.

2.2.2 Previous Investigations

Anchor Test Area has been included in various assessments and investigations conducted at RVAAP including:

- Relative Risk Site Evaluation for Newly Added Sites (USACHPPM 1998); and
- Characterization of 14 AOCs (MKM 2007).

The various assessments and investigations are summarized in subsequent subsections.

2.2.2.1 Relative Risk Site Evaluation for Newly Added Sites

In 1998, the U.S. Army Center for Health Promotion and Preventative Medicine (USACHPPM) completed the *Relative Risk Site Evaluation for Newly Added Sites* (USACHPPM 1998), which identified and provided a risk evaluation for thirteen newly discovered and previously uninvestigated AOCs for the purpose of prioritizing future remedial or corrective activities. Of the 13 identified AOCs, five AOCs were assigned a Relative Risk Site Evaluation (RRSE) score of "high," and the remaining eight AOCs were assigned a score of "medium."

Based on an evaluation of available data, Anchor Test Area was assigned a RRSE score of "medium" with two media of concern: groundwater and soil. Sediment was not identified at the AOC, and surface water was determined to occur only intermittently as storm water runoff. As described in the *Relative Risk Site Evaluation for Newly Added Sites* (USACHPPM 1998), five surface soil samples and one subsurface soil sample were collected around the dirt mound and in the sand pit at the AOC and analyzed for inorganic chemicals and explosives. A subsurface soil sample was collected from the center of the sand pit at a depth interval of 12-16 ft bgs and was used to estimate groundwater concentrations using a standard linear equilibrium soil/water partition model. Several inorganic chemicals were detected in groundwater (inferred from subsurface soil analysis) and surface soil. No explosives were detected. Surface soil and groundwater were identified as potential migration pathway factors as no physical barriers exist to prevent potential migration, although no evidence of contaminant migration was observed. The RRSE classified Anchor Test Area as a medium-priority AOC due to: (1) potentially contaminated surface soil; and (2) groundwater potentially migrating and impacting human and ecological receptors.

2.2.2.2 Characterization of 14 AOCs

Characterization of 14 AOCs [as described in the *Characterization of 14 AOCs at the Ravenna Army Ammunition Plant* (MKM 2007)] was performed to accomplish the following:

- Provide data for future assessments that may be conducted;
- Develop a conceptual site model (CSM);
- Identify key elements to be considered in future actions;
- Assess potential sources of contamination;
- Identify whether releases of contamination extend beyond the AOC boundary;
- Provide an initial assessment of the nature and lateral extent of contamination; and
- Provide a preliminary human health risk screening (HHRS) evaluation and ecological risk screening (ERS) evaluation.

The following field activities were conducted from October 2004 to May 2005 at Anchor Test Area to support the above objectives:

- Collection of six multi-increment (MI) surface soil (0-1 ft bgs) samples;
- Collection of one discrete surface soil (0-1 ft bgs) sample;
- Collection of two MI subsurface soil (1-3 ft bgs and 3-5 ft bgs) samples; and
- Completion of sampling location survey.

The Characterization of 14 AOCs utilizes the term "multi-increment" or "MI" sample. This sampling technique is currently referred to as "incremental sampling methodology" or "ISM." Additionally, the Characterization of 14 AOCs report refers to the two subsurface samples as "MI subsurface samples." However, these samples were composited from five soil borings and were not collected in manner consistent with ISM. All surface soil, subsurface soil, and sediment samples were analyzed for target analyte list (TAL) metals and explosives. One discrete surface soil sample was collected from one ISM sample area for volatile organic compound (VOC) analysis to fulfill requirements to conduct full-suite analysis for 10% of the ISM sample population. The discrete VOC sample was not subjected to ISM sample processing. Only surface and subsurface soil were sampled under the Characterization of 14 AOCs investigation, as no sediment or surface water were present at the AOC. No groundwater monitoring wells were installed as part of the investigation.

An HHRS and an ERS for Anchor Test Area were included in the Characterization of 14 AOCs. The HHRS compared chemical concentrations detected in the AOC samples to RVAAP criteria in effect at that time, which included facility-wide background concentrations for inorganic chemicals and USEPA Region 9 residential preliminary remediation goals (PRGs). The results of the HHRS identified contaminants above screening criteria in soil at Anchor Test Area, as summarized in Table 2-1.

Table 2-1. Chemicals of Potential Concern per the Characterization of 14 AOCs Report

Soil	Sediment	Surface Water	Groundwater
Arsenic Chromium Manganese	Not evaluated – medium not present.	Not evaluated – medium not present.	Not evaluated – no groundwater wells at Anchor Test Area

Source: *Characterization of 14 AOCs at the Ravenna Army Ammunition Plant* (MKM 2007)
AOC = Area of Concern

The ERS compared chemical concentrations detected in the Anchor Test Area environmental media to RVAAP facility-wide background concentrations for inorganic chemicals and ecological screening values (ESVs). The ERS followed screening methodology guidance presented in the *RVAAP Facility-Wide Ecological Risk Work Plan* (USACE 2003c) (herein referred to as the FWERWP) and *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2003). Chemicals were retained if they did not have screening values. Table 2-2 presents chemicals identified in the ERS as exceeding screening values for the AOC.

Table 2-2. Chemicals Exceeding Ecological Screening Values per the Characterization of 14 AOCs Report

Soil	Sediment	Surface Water	Groundwater
Arsenic Chromium Manganese Mercury	Not evaluated – medium not present.	Not evaluated – medium not present.	Not evaluated – no groundwater wells at Anchor Test Area

Source: *Characterization of 14 AOCs at the Ravenna Army Ammunition Plant* (MKM 2007)
AOC = Area of Concern

The report recommended a full risk assessment be considered to assist in the overall risk management decisions for the AOC.

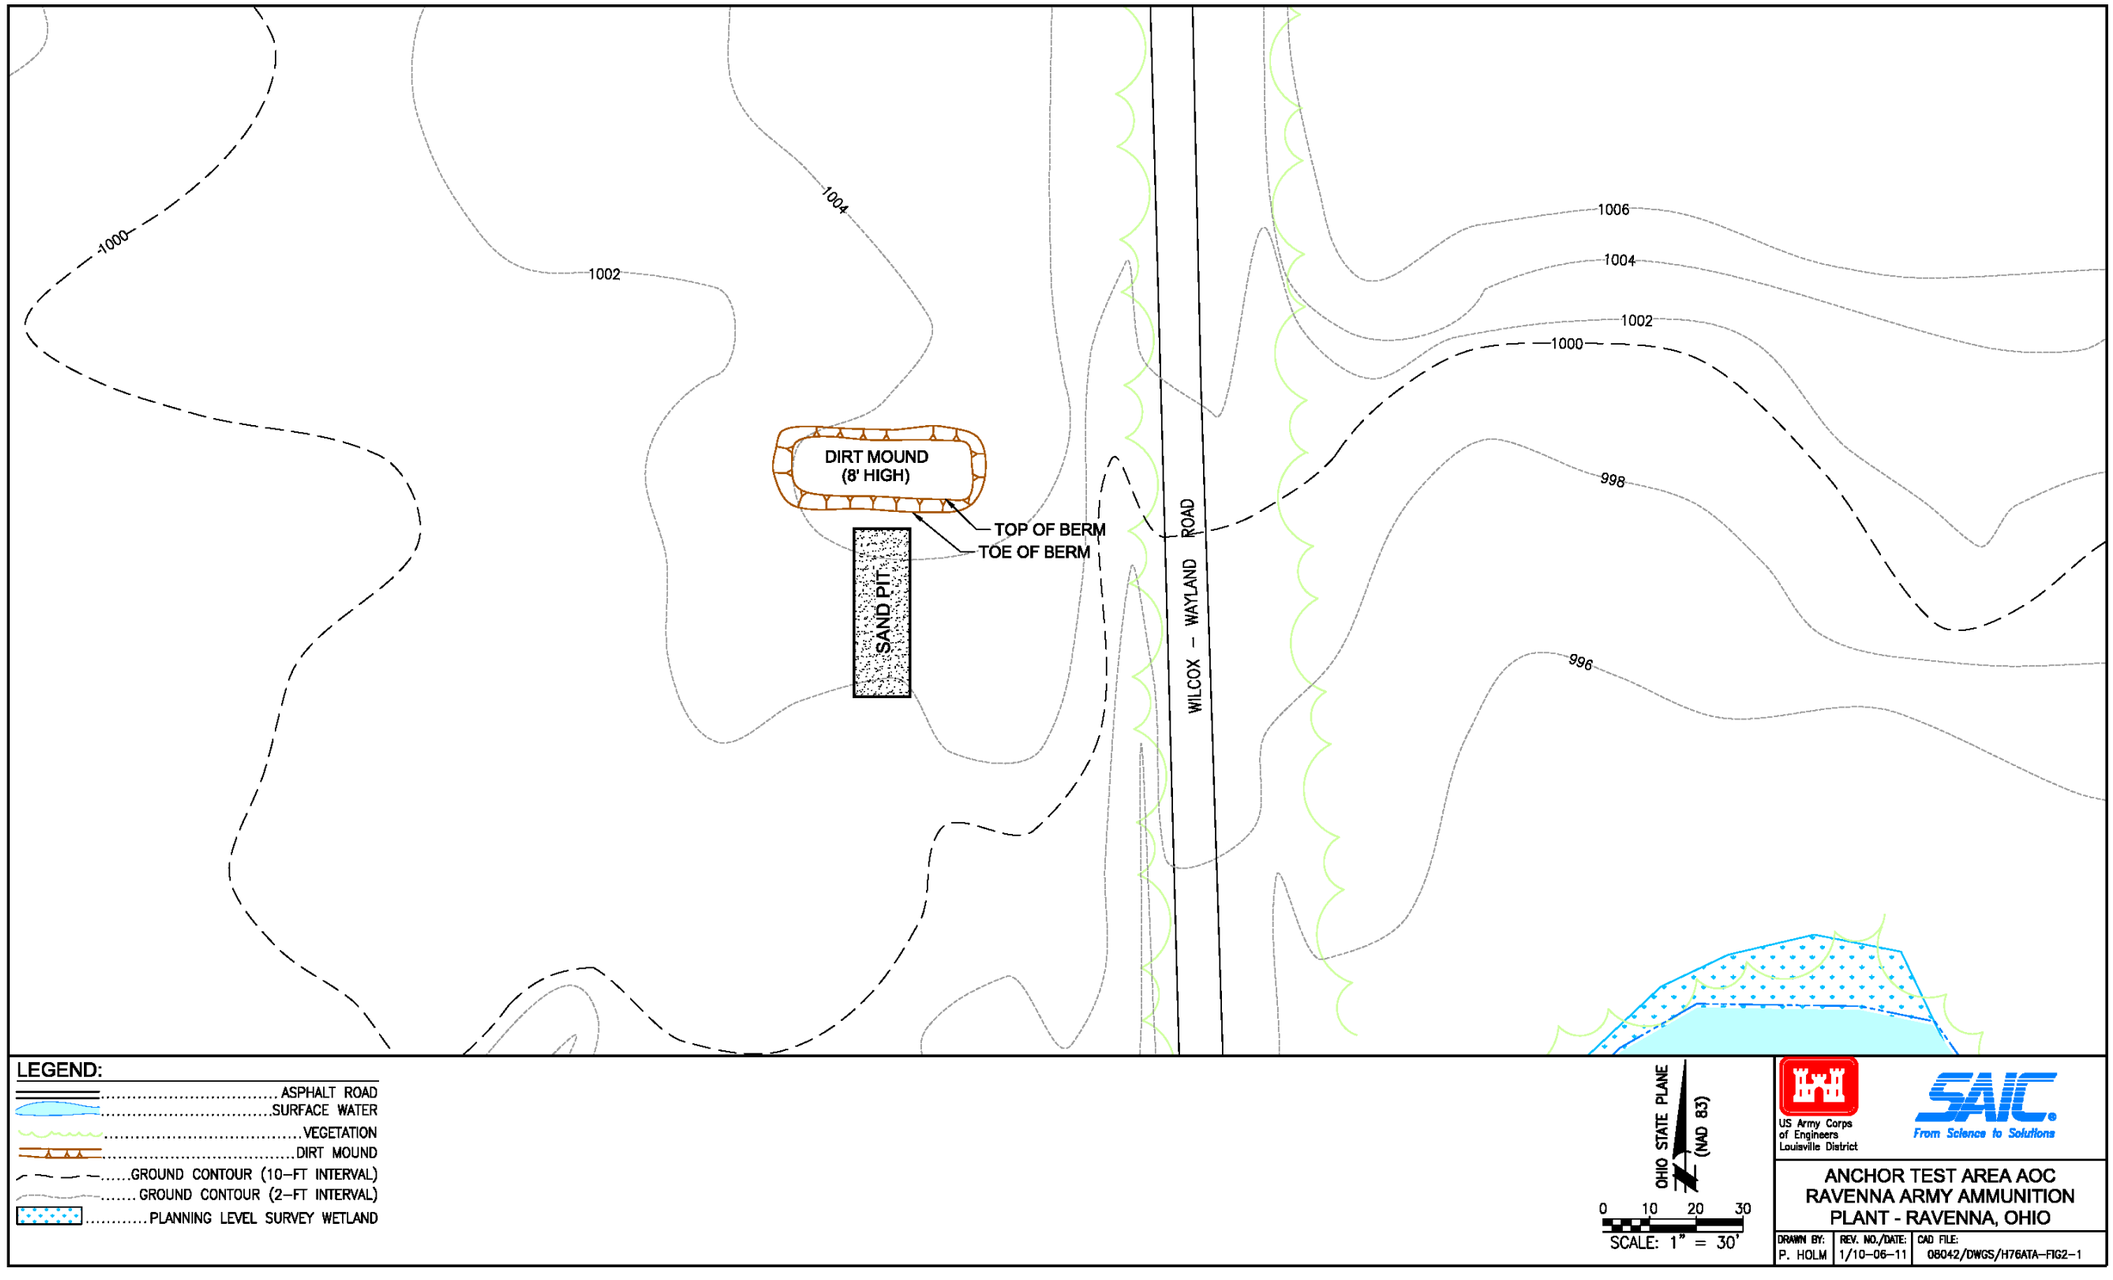

Figure 2-1. Anchor Test Area Features

THIS PAGE INTENTIONALLY LEFT BLANK.

3.0 ENVIRONMENTAL SETTING

This section describes the physical features, topography, geology, hydrogeology, and environmental characteristics of RVAAP and Anchor Test Area that are factors in interpreting the potential contaminant transport pathways, receptor populations, and exposure scenarios with respect to the evaluation of human health and ecological risks. This section also presents a preliminary CSM based on AOC characteristics and historical investigation data to provide a framework for evaluating contaminant nature and extent, fate and transport, and human health and ecological risk. An updated CSM is presented in Section 8.7 to integrate the results of evaluations performed in this report.

3.1 RVAAP PHYSIOGRAPHIC SETTING

RVAAP is located within the Southern New York Section of the Appalachian Plateaus physiographic province (USGS 1968). This province is also characterized by elevated uplands underlain primarily by Mississippian and Pennsylvanian age bedrock units that are horizontal or gently dipping. The province is characterized by its rolling topography with incised streams having dendritic drainage patterns. The Southern New York Section has been modified by glaciation, which rounded ridges, filled major valleys, and blanketed many areas with glacially derived unconsolidated deposits (i.e., sand, gravel, and finer grained outwash deposits). As a result of glacial activity in this section, old stream drainage patterns were disrupted in many locales, and extensive wetland areas developed.

3.2 SURFACE FEATURES AND AOC TOPOGRAPHY

The topography of RVAAP is gently undulating, with an overall decrease in ground elevation from a topographic high of approximately 1220 ft above mean sea level (amsl) in the far western portion of the facility, to low areas at approximately 930 ft amsl in far eastern portion of the facility.

USACE mapped the facility topography in February 1998 using a 2-ft contour interval with an accuracy of 0.02 ft. USACE based the topographic information on aerial photographs taken during the spring of 1997. The USACE survey is the basis for the topographical information illustrated in figures found in this report.

Anchor Test Area is located on the southern edge of a small topographic high isolated from other former operational areas at an elevation of approximately 1004 ft amsl (Figure 3-1). From this topographic high, the elevation gently slopes downward towards the south and west to approximately 998 ft amsl. The key surface features at the AOC are remnants of the former sandpit and the nearby dirt mounds that functioned as blast walls. Metal debris is present at the AOC, and a portion of a cement culvert is visible in a dirt mound. The AOC is heavily overgrown with trees and shrubs, and the immediate vicinity is heavily forested with the exception of the large wetland approximately 500 ft to the south (Figure 3-1). No perennial surface water or drainage conveyance features are present at the AOC. Surface water occurs only intermittently as overland storm water runoff associated with heavy rainfall events and generally flows towards the wetland located 500 ft to the south. The

wetland is drained to the south by an unnamed stream which enters the west branch of the Mahoning River.

3.3 SOIL AND GEOLOGY

3.3.1 Regional Geology

The regional geology at RVAAP consists of horizontal to gently dipping bedrock strata of Mississippian and Pennsylvanian age overlain by varying thicknesses of unconsolidated glacial deposits. The bedrock and unconsolidated geology at RVAAP and geology specific to Anchor Test Area are presented in the following subsections.

3.3.2 Soil and Glacial Deposits

Bedrock at RVAAP is overlain by deposits of the Wisconsin-aged Lavery Till in the western portion of the facility and the younger Hiram Till and associated outwash deposits in the eastern two-thirds of the facility (Figure 3-2). Unconsolidated glacial deposits vary considerably in their character and thickness across RVAAP, from zero in some of the eastern portion of the facility, to an estimated 150 ft in the south-central portion.

Thin coverings of glacial material have been completely removed as a consequence of human activities at locations such as Ramsdell Quarry. Bedrock is present at or near the ground surface in many locations, such as at Load Line 1 and the Erie Burning Grounds (USACE 2001a). Where glacial material is still present, its distribution and character indicate its origin as ground moraine. These tills consist of laterally discontinuous assemblages of yellow-brown, brown, and gray silty clays to clayey silts, with sand and rock fragments. Lacustrine sediment from bodies of glacial-age standing water have also been encountered in the form of deposits of uniform, light gray silt greater than 50 ft thick in some areas (USACE 2001a).

Soil at RVAAP is generally derived from the Wisconsin-age silty clay glacial till. Distributions of soil types are discussed and mapped in the *Soil Survey of Portage County, Ohio*, which describes soil as nearly level to gently sloping and poorly to moderately well drained (USDA 1978). Much of the native soil at RVAAP was disturbed during construction activities in former production and operational areas of the facility.

The Sharon Member of the Pennsylvanian Pottsville Formation is the primary bedrock beneath RVAAP. In the western half of the facility, the upper members of the Pottsville Formation, including the Connoquenessing Sandstone (also known as the Massillon Sandstone), Mercer Shale, and uppermost Homewood Sandstone, have been found. The regional dip of the Pottsville Formation measured in the west portion of RVAAP is 5.0-11.5 ft per mile to the south.

3.3.3 Geologic Setting of Anchor Test Area

Bedrock has not been encountered at Anchor Test Area during PBA08 RI or previous characterization activities. The inferred bedrock formation at Anchor Test Area is the Pennsylvanian age Pottsville Formation, Sharon Sandstone member, informally referred to as the Sharon Conglomerate (Figure 3-3) (Winslow et al. 1966). The Sharon Sandstone Member, the lowest unit of the Pottsville Formation, is a highly porous, loosely cemented, permeable, cross-bedded, frequently fractured and weathered, orthoquartzite sandstone, which is locally conglomeratic. Thin shale lenses occur in the upper portion of the unit.

The soil type found at this AOC is the Ellsworth silt loam (2-6% slopes). The Ellsworth is formed in silty clay loam and silty clay glacial till where bedrock is greater than 6 ft bgs. The Ellsworth silt loam is moderately well drained with slow to very slow permeability and potential for moderate erosion (USDA 2010).

As observed in PBA08 RI soil borings, the composition of unconsolidated deposits at Anchor Test Area generally consist of yellowish-brown silty sands overlain by yellowish-brown, medium stiff, silt-rich clay. Poorly sorted sands were observed in the vicinity of the former sand pit. Groundwater was observed 8.7-13 ft bgs in unconsolidated borings. Geologic descriptions of subsurface soil samples collected during the PBA08 RI are generally consistent with the conclusions from the Characterization of 14 AOCs. PBA08 RI boring logs containing geologic descriptions of unconsolidated deposits at Anchor Test Area are included in Appendix A.

Two undisturbed geotechnical samples were collected during the PBA08 RI. The geotechnical sample collected from 4.0-4.9 ft bgs was characterized as silty clay with little sand. The geotechnical sample collected from 10.0-12.0 ft bgs was characterized as sand-rich silt. A summary of the PBA08 RI geotechnical analysis including porosity and permeability is presented in Section 5.5.

3.4 HYDROGEOLOGY

3.4.1 Regional Hydrogeology

Sand and gravel aquifers are present in the buried-valley and outwash deposits in Portage County as described in the *Phase I Remedial Investigation Report of High-Priority Areas of Concern* (USACE 1998). Generally, these saturated zones are too thin and localized to provide large quantities of water for industrial or public water supplies; however, yields are sufficient for residential water supplies. Lateral continuity of these aquifers is unknown. Recharge of these units comes from surface water infiltration of precipitation and surface streams. Specific groundwater recharge and discharge areas at RVAAP have not been delineated.

The thickness of the unconsolidated interval at RVAAP ranges from thin to absent in the eastern and northeastern portion of RVAAP to an estimated 150 ft in the central portion of the facility. The groundwater table occurs within the unconsolidated zone in many areas of the facility. Because of the

heterogeneous nature of the unconsolidated glacial material, groundwater flow patterns are difficult to determine with a high degree of accuracy. Vertical recharge from precipitation likely occurs via infiltration along root zones, desiccation cracks, and partings within the soil column. Laterally, most groundwater flow likely follows topographic contours and stream drainage patterns, with preferential flow along pathways (e.g., sand seams, channel deposits, or other stratigraphic discontinuities) having higher permeabilities than surrounding clay or silt-rich material. Figure 3-4 illustrates facility-wide potentiometric surface data in the unconsolidated interval for the contemporaneous measurement event in January 2010 (EQM 2010).

Within bedrock units at RVAAP, the principle water-bearing aquifer is the Sharon Sandstone/Conglomerate. Depending on the existence and depth of overburden, the Sharon Sandstone/Conglomerate ranges from an unconfined to a leaky artesian aquifer. Water yields from on-site water supply wells completed in the Sharon Sandstone/Conglomerate ranged from 30-400 gallons per minute (gpm) (USATHAMA 1978). Well yields of 5-200 gpm were reported for on-site bedrock wells completed in the Sharon Sandstone/Conglomerate (Kammer 1982). Other local bedrock units capable of producing water include the Homewood Sandstone, which is generally thinner and only capable of well yields less than 10 gpm, and the Connoquenessing Sandstone. Wells completed in the Connoquenessing Sandstone in Portage County have yields ranging from 5-100 gpm but are typically less productive than the Sharon Sandstone/Conglomerate due to lower permeabilities (Winslow et al. 1966).

Figure 3-5 shows the potentiometric surface within bedrock strata at RVAAP in January 2010 (EQM 2010). The bedrock potentiometric map shows a more uniform and regional eastward flow direction than the unconsolidated zone that is not as affected by local surface topography. Due to the lack of well data in the western portion of RVAAP, general flow patterns are difficult to discern. For much of the eastern half of RVAAP, bedrock potentiometric elevations are higher than the overlying unconsolidated potentiometric elevations, indicating an upward hydraulic gradient. This evidence suggests there is a confining layer that separates the two aquifers. In the far eastern area, the two potentiometric surfaces are at approximately the same elevation, suggesting hydraulic communication between the two aquifers is occurring.

3.4.2 Anchor Test Area Hydrologic/Hydrogeologic Setting

No monitoring wells are present at Anchor Test Area. The nearest facility-wide monitoring well is BKGmw-013, located approximately 2,200 ft to the north (Figures 3-1 and 3-4). Well gauging data collected at this well during the January 2010 facility-wide sampling event indicated a top of casing water level of 976.45 ft amsl (EQM 2010). Monitoring well BKGmw-013 is completed in the unconsolidated zone to a depth of 25.5 ft bgs (948.45 ft amsl). The generalized regional groundwater flow direction in the vicinity of the AOC is towards the east, as presented in Figure 3-4.

During the RRSE, a soil boring was advanced to a depth of 16 ft bgs in the middle of the sand pit, and groundwater was not encountered (USACHPPM 1998). The soil borings advanced during the PBA08

RI indicated a soil overburden thickness greater than 13 ft bgs with groundwater encountered at depths of approximately 8.7-13.0 ft bgs.

3.4.3 Surface Water

3.4.3.1 Regional Surface Water

RVAAP resides within the Mahoning River watershed, part of the Ohio River basin. The west branch of the Mahoning River is the main surface stream in the area. The west branch flows adjacent to the west end of the facility, generally in a north to south direction, before flowing into the Michael J. Kirwan Reservoir, located to the south of State Route 5 (Figure 1-1). The west branch flows out of the reservoir and parallels the southern RVAAP boundary before joining the Mahoning River east of RVAAP. The western and northern portions of RVAAP display low hills and a dendritic surface drainage pattern. The eastern and southern portions are characterized by an undulating to moderately level surface, with less dissection of the surface drainage. The facility is marked with marshy areas and flowing and intermittent streams whose headwaters are located in the facility's upland areas.

The three primary watercourses that drain RVAAP are (Figure 1-2):

- South fork of Eagle Creek;
- Sand Creek; and
- Hinkley Creek.

All of these watercourses have many associated tributaries. Sand Creek, with a drainage area of 13.9 square miles, flows generally in a northeast direction to its confluence with the south fork of Eagle Creek. In turn, the south fork of Eagle Creek continues in a northerly direction for 2.7 miles to its confluence with Eagle Creek. The drainage area of the south fork of Eagle Creek is 26.2 square miles, including the area drained by Sand Creek. Hinkley Creek originates just southeast of the intersection between State Routes 88 and 303 to the north of the facility. Hinkley Creek, with a drainage area of 11.0 square miles, flows in a southerly direction through the facility and converges with the west branch of the Mahoning River south of the facility (USACE 2001a).

Approximately one-third of RVAAP meets the regulatory definition of a wetland, with the majority of the wetland areas located in the eastern portion of the facility. Wetland areas at RVAAP include seasonal wetlands, wet fields, and forested wetlands. Many of the wetland areas are the result of natural drainage or beaver activity; however, some wetland areas are associated with anthropogenic settling ponds and drainage areas.

Approximately 50 ponds are scattered throughout the facility. Many were constructed within natural drainage ways to function as settling ponds or basins for process effluent and runoff. Others are natural in origin, resulting from glacial action or beaver activity. Water bodies at RVAAP support aquatic vegetation and biota as described in Section 3.6.1.2. Storm water runoff at RVAAP is controlled primarily by natural drainage except in former operations areas where an extensive storm

sewer network helps to direct runoff to drainage ditches and settling ponds. In addition, the storm sewer system was one of the primary drainage mechanisms for process effluent during the period that production facilities were in operation.

3.4.3.2 Anchor Test Area Surface Water

No perennial surface water is present at Anchor Test Area, and there are no persistent drainage features. As the AOC is located on the southern edge of a localized topographic high, storm water runoff associated with heavy rainfall events that is not infiltrated discharges towards the wetland located 500 ft south of the AOC (Figure 3-1). The wetland is drained by an unnamed stream to the west branch of the Mahoning River.

3.5 CLIMATE

The general climate of the RVAAP area is continental and is characterized by moderately warm and humid summers, reasonably cold and cloudy winters, and wide variations in precipitation from year to year. Climate data for the RVAAP area presented below were obtained from available National Weather Service records for the 30-year period of record from 1971 to 2000 at the Youngstown Regional Airport, Ohio (http://www.weather.gov/climate/xmacis.php?wfo=cle). Wind speed data for Youngstown, Ohio, are from the National Climatic Data Center (http://lwf.ncdc.noaa.gov/oa/climate/online/ccd/avgwind.html) for the available 53-year period of record from 1950 through 2002.

Average annual rainfall in the RVAAP area is 38.15 inches, with the highest monthly average occurring in July (4.14 inches) and the lowest monthly average occurring in February (2.03 inches). Average annual snowfall totals approximately 52.8 inches, with the highest monthly average occurring in January (13.8 inches). It should be noted that due to the influence of lake-effect snowfall events associated with Lake Erie (located approximately 35 miles to the northwest of RVAAP), snowfall totals vary widely throughout northeastern Ohio.

The average annual daily temperature in the RVAAP area is 48.8 ºF, with an average daily high temperature of 58.3 ºF and an average daily low temperature of 39.3 ºF. The record high temperature of 100 ºF occurred in July 1988, and the record low temperature of -22 ºF occurred in January 1994. The prevailing wind direction at RVAAP is from the southwest, with the highest average wind speed occurring in January (11.4 miles per hour) and the lowest average wind speed occurring in August (7.4 miles per hour). Thunderstorms occur on approximately 35 days per year and are most abundant from April through August. The RVAAP area is susceptible to tornadoes; minor structural damage to several buildings on facility property occurred as the result of a tornado in 1985.

3.6 POTENTIAL RECEPTORS AT ANCHOR TEST AREA

The following sections discuss potential human and ecological receptors at Anchor Test Area.

3.6.1.1 Human Receptors

RVAAP is a controlled-access facility that is fenced and patrolled by security personnel. Anchor Test Area, located in the south-central portion of RVAAP, is currently inactive. Full-time OHARNG, BRAC, and contractor staff work at the facility. Military training and operations are conducted at the facility. The OHARNG projected future land use for the AOC is Military Use and Training. The representative receptor is the National Guard Trainee and per the FWHHRAM this constitutes the Risk Assessment Land Use of Dismounted Training-Digging. National Guard Training, in conjunction with the evaluation of agricultural-residential land uses and associated receptors, form the basis for identifying COCs. Residential Land Use, specifically the Resident Farmer scenario, is included to evaluate COCs for unrestricted land use at the AOC as required by the CERCLA process and as outlined in the FWHHRAM (USACE 2005a).

Additional information regarding potential future land uses is included in Section 7.2.3. OHARNG plans to meet its future potable water needs using the local municipal water supply supplemented with potable water from on-site groundwater wells, where required.

3.6.1.2 Ecological Receptors

RVAAP has a diverse range of vegetation and habitat resources. Habitats present within the facility include large tracts of closed-canopy hardwood forest, scrub/shrub open areas, grasslands, wetlands, open-water ponds and lakes, and semi-improved administration areas (OHARNG 2008).

Vegetation at RVAAP can be grouped into three categories: herb-dominated, shrub-dominated, and tree-dominated. Approximately 60% of the facility is covered by forest or tree-dominated vegetation. The facility has seven forest formations, four shrub formations, eight herbaceous formations, and one non-vegetated formation (OHARNG 2008).

Surface water features within RVAAP include a variety of streams, ponds, floodplains, and wetlands. Numerous streams drain the facility, including approximately 19 miles of perennial streams. The total length of streams at the facility is 212 linear miles. Approximately 153 acres of ponds are found on the facility. These ponds provide valuable wildlife habitat and support wood ducks, hooded mergansers, mallards, Canada geese, and many other birds and wildlife species. Some ponds have been stocked with fish and are used for fishing and hunting (OHARNG 2008). Wetlands are abundant and prevalent throughout the facility. These wetland areas include seasonal wetlands, wet fields, and forested wetlands. Most of the wetland areas on the facility are the result of natural drainage and beaver activity; however, some wetland areas are associated with anthropogenic settling ponds and drainage areas.

An abundance of wildlife is present on the facility; 35 species of land mammals, 214 species of birds, 41 species of fish, and 34 species of amphibians and reptiles have been identified. No federally listed species are known to reside at the facility, and no critical habitat occurs (OHARNG 2008). Ohio State-listed plant and animal species have been identified through confirmed sightings and/or biological inventories at the facility and are presented in Table 3-1.

The AOC is within a mature forest. There are no known sightings of state-listed or federally listed species on the AOC. Additional information specific to ecological resources at Anchor Test Area is included in Section 7.3.

Table 3-1. Rare Species List

CAMP RAVENNA JOINT MILITARY TRAINING CENTER (CRJMTC) RARE SPECIES LIST
27 April 2010

I. Species confirmed to be on CRJMTC property by biological inventories and confirmed sightings.

A. State Endangered

1. American bittern, *Botaurus lentiginosus* (migrant)
2. Northern harrier, *Circus cyaneus*
3. Yellow-bellied Sapsucker, *Sphyrapicus varius*
4. Golden-winged warbler, *Vennivora chrysoptera*
5. Osprey, *Pandion haliaetus* (migrant)
6. Trumpeter swan, *Cygnus buccinators* (migrant)
7. Mountain Brook Lamprey, *Ichthyomyzon greeleyi*
8. Graceful Underwing, *Catocala gracilis*
9. Tufted Moisture-loving Moss, *Philonotis Fontana var. caespitosa*
10. Bobcat, *Felis rufus*
11. Narrow-necked Pohl's Moss, *Pohlia elongata var. elongate*
12. Sandhill Crane, *Grus Canadensis* (probable nester)
13. Bald Eagle, *Haliaetus leucocephalus* (nesting pair)

B. State Threatened

1. Barn owl, *Tyto alba*
2. Dark-eyed junco, *Junco hyemalis* (migrant)
3. Hermit thrush, *Catharus guttatus* (migrant)
4. Least bittern, *Ixobrychus exilis*
5. Least flycatcher, *Empidonax minimus*
6. *Psilotreta indecisa* (caddis fly)
7. Simple willow-herb, *Epilobium strictum*
8. Woodland Horsetail, *Equisetum sylvaticum*
9. Lurking leskea, *Plagiothecium latebricola*
10. Pale sedge, *Carex pallescens*

C. State Potentially Threatened Plants

1. Gray Birch, *Betula populifolia*
2. Butternut, *Juglans cinerea*
3. Northern rose azalea, *Rhododendron nudiflorum var. roseum*
4. Hobblebush, *Viburnum alnifolium*
5. Long Beech Fern, *Phegopteris connectilis (Thelypteris phegopteris)*
6. Straw sedge, *Carex straminea*
7. Water avens, *Geum rivale*
8. Tall St. John's wort, *Hypercium majus*
9. Swamp oats, *Sphenopholis pensylvanica*
10. Shining ladies'-tresses, *Spiranthes lucida*
11. Arbor Vitae, *Thuja occidentalis*
12. American Chestnut, *Castanea dentate*

Table 3-1. Rare Species List (continued)

D. State Species of Concern

1. Pygmy shrew, *Sorex hovi*
2. Star-nosed mole, *Condylura cristata*
3. Woodland jumping mouse, *Napaeozapus insignis*
4. Sharp-shinned hawk, *Accipiter striatus*
5. Marsh wren, *Cistothorus palustris*
6. Henslow's sparrow, *Ammodramus henslowii*
7. Cerulean warbler, *Dendroica cerulea*
8. Prothonotary warbler, *Protonotaria citrea*
9. Bobolink, *Dolichonyx oryzivorus*
10. Northern bobwhite, *Colinus virginianus*
11. Common moorhen, *Gallinula chloropus*
12. Great egret, *Ardea alba* (migrant)
13. Sora, *Porzana carolina*
14. Virginia Rail, *Rallus limicola*
15. Creek heelsplitter, *Lasmigona compressa*
16. Eastern box turtle, *Terrapene carolina*
17. Four-toed Salamander, *Hemidacrylium scuta/um*
18. *Stenonema ithica* (mayfly)
19. *Apamea mixta* (moth)
20. *Brachylomia algens* (moth)
21. Sedge wren, *Cistothorus platensis*

E. State Special Interest

1. Canada warbler, *Wilsonia canadensis*
2. Little blue heron, *Egretta caerula*
3. Magnolia warbler, *Dendroica magnolia*
4. Northern waterthrush, *Seiurus noveboracensis*
5. Winter wren, *Troglodytes troglodytes*
6. Back-throated blue warbler, *Dendroica caerulescens*
7. Brown creeper, *Certhia americana*
8. Mourning warbler, *Oporornis philadelphia*
9. Pine siskin, *Carduelis pinus*
10. Purple finch, *Carpodacus purpureus*
11. Red-breasted nuthatch, *Sitta canadensis*
12. Golden-crowned kinglet, *Regulus satrapa*
13. Blackburnian warbler, *Dendroica fusca*
14. Blue grosbeak, *Guiraca caerulea*
15. Common snipe, *Gallinago gallinago*
16. American wigeon, *Anas americana*
17. Gadwall, *Anas strepera*
18. Green-winged teal, *Anas crecca*
19. Northern shoveler, *Anas clypeata*
20. Redhead duck, *Aytya americana*
21. Ruddy duck, *Oxyura jamaicensis*

NOTE: There are currently no federally listed species or critical habitat on CRJMTC property. There are a few species currently under federal observation for listing but none listed.

3.7 PRELIMINARY CONCEPTUAL SITE MODEL

A preliminary CSM was developed in the *Performance Based Acquisition 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1* (herein referred to as the PBA08 SAP) to develop sampling rationales and data quality objectives (DQOs) for the PBA08 RI at Anchor Test Area (USACE 2009a). An updated version of the FWSAP was developed in February 2011 and approved by the Ohio EPA; however, the PBA08 RI was implemented prior to approval of this updated version. The preliminary CSM included a description of primary (active) and secondary (e.g., residual chemicals in soil) contaminant sources, migration pathways, contaminant discharge points, and potential receptors based on operational history and prior investigations. This preliminary CSM, summarized below, is further refined in Section 8.7 to integrate results of the contaminant nature and extent evaluation, fate and transport modeling, HHRA, and ERA presented in this report for Anchor Test Area.

3.7.1 Contaminant Sources

No primary contaminant sources remain at Anchor Test Area. The dates and duration of operational usage are unknown, although available data indicate it was not active until the early 1960s. Infrastructure consisted of only a sandpit and earthen mounds that functioned as blast walls (the remnants of which are still visible), as well as metal debris presumably sourced from the former testing activities. Secondary sources (contaminated media) identified in previous investigations and further characterized during the PBA08 RI are further described below.

3.7.1.1 Soil

Based on previous characterization, contaminated surface and subsurface soil at the AOC may represent a potential secondary source of contamination. Previous analyses of Anchor Test Area soil data under the Characterization of 14 AOCs identified four TAL metals in surface soil and subsurface soil as COPCs for human health and ecological receptors. Five surface soil samples were collected and five soil borings were installed during the PBA08 RI to further define the extent of contamination.

3.7.1.2 Sediment and Surface Water

No historical or PBA08 RI sediment or surface water samples were collected because perennial surface water or defined drainage conveyances are not present at the AOC. Surface water may occur only as intermittent storm water runoff associated with heavy rainfall events.

3.7.1.3 Groundwater

Groundwater at RVAAP is evaluated on a facility-wide basis, sampled under the Facility-Wide Groundwater Monitoring Program (FWGWMP), and will be evaluated through the CERCLA process

in a separate report. Potential leaching of soil contaminants to groundwater is evaluated through fate and transport modeling.

3.7.2 Migration Pathways

As surface water and sediment are not present at the AOC, vertical migration of soil contaminants to groundwater is the only potential migration pathway. Modeling of contaminant leaching from soil sources and transport via groundwater is included in this RI; however, a full evaluation of the groundwater pathway will be addressed under a separate report.

3.7.3 Contaminant Discharge Points

Contaminants are not confined within the AOC boundary, as surface water at the AOC occurs only as intermittent storm water runoff associated with heavy rainfall events and would generally flow towards the wetland located 500 ft to the south. The closest identified potential discharge point for groundwater would also be the wetland and the unnamed stream which drains south to the west branch of the Mahoning River. Leaching of soil contaminants to groundwater, with subsequent lateral migration to either surface water discharge or exposure points, are potential migration pathways and are further evaluated in Section 6.0.

3.7.4 Potential Receptors

Potential human health and ecological receptors for the AOC, based on current land use, Reasonable and Anticipated Future Land Use (RAFLU), and present-day ecological resources, are discussed in Section 3.6. The future potential for human exposure to contaminants associated with this AOC is primarily for the National Guard Trainee. Current potential for human exposure is mitigated by inactivity at the AOC, the absence of permanent residents within RVAAP, and facility access and security controls to deter unauthorized entry. However, current and future land use includes the potential for human receptor exposure, and both terrestrial and aquatic receptors are present in the AOC vicinity. Therefore, an HHRA and ERA were conducted as part of the PBA08 RI, and the results are integrated into the updated CSM presented in Section 8.7.

4.0 STUDY AREA INVESTIGATION

This section presents the methods used for the development of DQOs, field data collection, analytical data management, and laboratory programs for the PBA08 RI at Anchor Test Area. The PBA08 RI was implemented in accordance with the PBA08 SAP to supplement historical data and complete the RI phase of the CERCLA process. The results of the PBA08 RI sampling are combined with the results of previous sampling events to evaluate the nature and extent of contamination, assess potential future impacts to groundwater, conduct risk assessments, and evaluate the need for remedial alternatives.

As presented in Section 2.2.2, there have been several investigations at the AOC, including the HHRS and ERS during the Characterization of 14 AOCs. As part of the PBA08 RI DQOs, an initial screening approach was used to help focus the PBA08 RI investigation of specific chemicals and areas to be further evaluated by assessing nature and extent of contamination observed in historical samples (Section 3.2.2 of the PBA08 SAP). The screening approach presented in the PBA08 SAP compared sample results from previous investigations at the AOC to chemical-specific facility-wide cleanup goals (FWCUGs) for the Resident Farmer Adult, Resident Farmer Child, and National Guard Trainee at the 1E-06 cancer risk level and non-carcinogenic risk hazard quotient (HQ) of 0.1. The most protective of the FWCUGs for the three potential receptors are referred to as "screening criteria" in Table 4-1. Previous results were also compared to FWCUGs at the higher target risk (TR) of 1E-05 and HQ of 1.0 to facilitate the identification of potential source areas that may require additional sampling to refine the extent of contamination. Table 4-1 lists the historical sample results of chemicals with detected concentrations that exceed screening criteria in all previously sampled media further investigated in this RI, as well as the minimum detected concentrations and maximum detected concentrations (MDCs). These chemicals and any additional chemicals detected in samples collected historically and during the PBA08 RI are further evaluated in this report.

Table 4-1. Chemicals Detected at Concentrations above Screening Criteria in Previous Investigations

Medium	Analyte	Units	Frequency of Detection	Minimum Detect	Maximum Detect	Screening Criteria[a]
Surface Soil	Arsenic	mg/kg	6/6	7.5	54	15.4
	Chromium	mg/kg	6/6	16	36	17.4
	Manganese	mg/kg	6/6	330	1500	1450
Subsurface Soil	Chromium	mg/kg	2/2	26	28	27.2
Sediment	Not sampled	--	--	--	--	--
Surface water	Not sampled	--	--	--	--	--

Note: This table was generated using data from the *Characterization of 14 AOCs at the Ravenna Army Ammunition Plant* (MKM 2007).
[a]Screening criteria are the smaller of the facility-wide cleanup goals (FWCUGs) for the Resident Farmer Adult, Resident Farmer Child, and National Guard Trainee based on hazard index (HI)=0.1 or Target Risk=1E-06.
-- Not applicable.

Representatives of RVAAP, Ohio EPA, USACE Louisville, and Camp Ravenna reviewed and approved the PBA08 RI sample locations in December 2009 as part of the approval process for the PBA08 SAP. The PBA08 RI, conducted February 2010 through April 2010, included the collection of surface soil and subsurface soil using discrete and ISM sampling techniques. No sediment or surface water samples were collected at Anchor Test Area during the PBA08 RI, as these media were not present. Additionally, no groundwater samples were collected during the PBA08 RI, as the current conditions of groundwater will be evaluated in a separate report. The following sections describe the rationale and method of sample collection for each component of the field investigation.

4.1 SOIL AND VADOSE ZONE CHARACTERIZATION

Soil samples were collected at the AOC to assess contaminant occurrence and distribution in surface and subsurface soil. All PBA08 RI and historical sample locations used in this RI are presented on Figure 4-1.

4.1.1 Surface Soil Sampling Rationale and Methods

All surface soil samples collected during the PBA08 RI were collected using ISM and discrete sampling techniques. Two ISM samples were collected to vertically delineate surface soil above screening criteria, and three discrete samples were collected to evaluate chromium speciation. ISM samples were analyzed for TAL metals and explosives, and chromium speciation samples were analyzed for total and hexavalent chromium. One ISM sample (15% of the total number of ISM samples collected) was analyzed for RVAAP full-suite analytes [i.e., TAL metals, explosives, propellants (nitrocellulose and nitroguanidine), semi-volatile organic compounds (SVOCs), VOCs, polychlorinated biphenyls (PCBs), and pesticides]. Table 4-2 presents the specific rationale for each surface soil sample collected.

For the PBA08 RI, the corners of each of the designated ISM sampling areas were located using a digital global positioning system (GPS) and were marked using wooden stakes. Sampling crews selected aliquot locations by walking over the entire ISM sampling area and marking the requisite number of points using flagging. At least 30 aliquots for each ISM sample were collected. Aliquot locations were selected in the field and were not predetermined using a grid. Approximately equal sample volume aliquots were collected from a depth of 0-1 ft bgs using a ⅝-inch diameter push probe. A soil description was completed for each ISM sample and is included in Appendix A.

All aliquots collected from a given ISM sample area were combined in a labeled container for transport to the laboratory in accordance with the PBA08 SAP. At the laboratory, each sample was air-dried, sieved, and ground for specified non-volatile chemical analyses.

Quality control (QC) field duplicate and quality assurance (QA) split samples were collected from the ISM sample areas at 10% frequency (one sample). The QC field duplicate sample was submitted to the laboratory as "blind" and was used to determine whether the field sampling technique was reproducible and as an indicator of sample heterogeneity. The QA split sample was sent to a USACE

QA laboratory for independent analysis and evaluation of analytical results obtained by the primary laboratory.

QA/QC samples were collected as replicate ISM samples requiring three separate ISM samples from the same sample area. The QA/QC samples were collected from a set of 30 aliquot locations that were positioned adjacent to the location used for the initial ISM sample. Aliquots for QA/QC samples were collected in separate stainless steel bowls and were placed into separate, labeled containers.

The ISM was not utilized for samples collected for VOC analysis because the air drying, mixing, and sieving of aliquots required by the method could result in the loss of VOCs from the sample. For ISM sample areas designated for VOC analysis, one discrete sample was collected from a depth of 0-1 ft bgs within the ISM sample area using the bucket hand auger method, as described in the PBA08 SAP. The specific location of the discrete sample was randomly chosen. Soil portions designated for VOC analyses were not homogenized in the field but were placed directly in the sample container and compacted to zero headspace.

In addition to the ISM surface soil samples collected, three discrete chromium speciation samples were collected from historical sample locations to evaluate the potential contribution of hexavalent chromium to total chromium concentrations in soil. Samples from 0-1 ft bgs were collected in accordance with the bucket hand auger method described in Section 4.5.2.1.1 of the *Facility-Wide Sampling and Analysis Plan* (USACE 2001a) (herein referred to as the FWSAP). An updated version of the FWSAP was developed in February 2011 and approved by the Ohio EPA; however, the PBA08 RI was implemented prior to approval of this updated version. Two samples were collected from areas previously identified as having elevated total chromium concentrations, and one sample was collected from an area previously identified as having a total chromium concentration near the background concentration. Field duplicate samples were not collected for chromium speciation samples. A sample log, including soil description, was completed for each sample, and all logs are included in Appendix A.

Following collection of discrete samples, excess soil was designated as investigation-derived waste (IDW) and placed in lined, labeled, 55-gal drums that were sealed after use and staged at Building 1036. IDW management practices for all media are discussed in Appendix F. Hand auger borings were backfilled to ground surface with dry bentonite chips and hydrated with the project-approved potable water.

Table 4-2. Surface Soil Samples and Rationales

Sample Type	Depth (ft bgs)	Station	Sample	Date Sampled	Comments/Rationale
ISM	0-1	ATAss-015M	ATAss-015M-5036-SO	2/17/2010	Delineate lateral extent of previously identified surface contamination; Analyzed for RVAAP full-suite analytes.

4.1.2 Subsurface Soil Sampling Rationale and Methods

Twenty subsurface soil samples were collected from five soil borings to delineate the vertical extent of contamination. These locations included:

- Three soil borings in previous ISM areas with chemical concentrations greater than respective FWCUGs; and

- Two soil borings in areas previously not sampled.

Subsurface soil borings were completed by direct push technology (DPT) using a Geoprobe® and/or hand auger. Soil samples collected using the Geoprobe® were collected in a single use acetate liner and were collected at discrete sample locations and at depth intervals presented in the PBA08 SAP. Each soil boring was sampled at the following intervals: 0-1 ft bgs, 1-4 ft bgs, 4-7 ft bgs, and 7-13 ft bgs. Each interval was composited and homogenized in a stainless steel bowl, with the exception of VOC samples. The sample collected from the 7-13 ft bgs interval was archived on-site, while the 4-7 ft bgs interval sample was analyzed under an expedited 5-day turnaround time. As specified in the PBA08 SAP, if there was one chemical concentration that exceeded screening criteria in the 4-7 ft bgs sample, the 7-13 ft bgs sample was analyzed. In addition, at least 10% of all subsurface samples from 7-13 ft bgs were submitted for laboratory analysis to ensure adequate characterization of subsurface soil to 13 ft bgs was performed. One sample collected from the 7-13 ft bgs sample interval was submitted for laboratory analysis to ensure adequate characterization of 7-13 ft bgs was performed. No samples were analyzed due to preliminary screening criteria exceedance within the 4-7 ft bgs sample interval. Table 4-3 presents the specific rationale for each subsurface soil sample collected.

All samples were analyzed for TAL metals and explosives, and 15% of samples (two) were analyzed for the RVAAP full-suite analytes [i.e., TAL metals, explosives, propellants (nitrocellulose and nitroguanidine), SVOCs, VOCs, PCBs, and pesticides]. Two QC field duplicates and two QA split samples were collected to satisfy the QA/QC sample requirements of 10% frequency for subsurface soil samples. A lithologic soil description was completed for each soil boring and is included in Appendix A.

Two geotechnical samples were collected from one boring location to provide soil data for fate and transport modeling. A pilot boring was installed with a Geoprobe® to a depth of 13 ft bgs to allow lithologic characterization of the soil and to determine the appropriate geotechnical sample intervals (Appendix A). The geotechnical sample location was offset from the pilot boring and drilled with hollow stem auger attachments. Geotechnical samples were then collected beneath the hollow stem augers directly into the Shelby tubes. The undisturbed Shelby tube samples were collected from 4.0-4.9 ft bgs and 10-12 ft bgs. The Shelby tube was sealed with wax, capped, and submitted for laboratory geotechnical analysis for porosity, bulk density, moisture content, total organic carbon, grain size fraction analysis, and permeability. Laboratory analytical results for geotechnical samples are presented in Appendix D. A field duplicate sample was not collected for the geotechnical sample.

Following collection of the samples, excess soil was designated as IDW and placed in lined and labeled 55-gal drums that were sealed after use and staged at Building 1036. IDW practices for all media are discussed in Appendix F. Subsurface borings were backfilled to ground surface with dry bentonite chips and hydrated with the project-approved potable water.

4.2 SURFACE WATER AND SEDIMENT CHARACTERIZATION

No surface water or sediment samples were collected during the PBA08 RI, because these media are not present at the AOC.

4.3 ASBESTOS INSPECTION

A visual inspection for asbestos-containing material (ACM) was performed at Anchor Test Area in September 2011 by an Asbestos Hazard Evaluation Specialist. The Asbestos Visual Inspection Report is in Appendix A. The Asbestos Hazard Evaluation Specialist did not identify any visibly discernable ACM at the AOC. The visual inspection identified the former blast wall dirt mound near the sandpit, which is overgrown with small trees and vegetation. Due to the fact that historical records indicate that this is a dirt mount to serve as a blast wall (not used as a waste burial) and there were no buildings or other potential ACM at the AOC, no further investigation for asbestos is required for Anchor Test Area.

4.4 CHANGES FROM THE WORK PLAN

Changes to the PBA08 SAP are documented in field change requests (FCRs) (Appendix B). Changes made in the field based on AOC conditions are not documented on FCRs but on the field sampling

logs (Appendix A). These changes are presented in Table 4-4. Revised coordinates for all station locations can be found on the field sampling logs.

PBA08 SAP = Performance-Based Acquisition 2008 Sampling and Analysis Plan

4.5 ANALYTICAL PROGRAM OVERVIEW

The following sections describe the analytical program followed during the PBA08 RI.

4.5.1 Data Quality Objectives

Samples were collected and analyzed according to the FWSAP and PBA08 SAP that were prepared in accordance with USACE and USEPA guidance. The FWSAP and PBA08 SAP outline the organization, objectives, intended data uses, and QA/QC activities to perform in order to achieve the desired DQOs for maintaining the defensibility of the data. Project DQOs were established in accordance with USEPA Region 5 guidance. Requirements for sample collection, handling, analysis criteria, target analytes, laboratory criteria, and data verification criteria for the RI are consistent with USEPA and United States Department of Defense (DoD) requirements. DQOs for this project included analytical precision, accuracy, representativeness, completeness, comparability, and sensitivity for the measurement data. Appendix C presents an assessment of the analytical program objectives.

4.5.2 Quality Assurance and Quality Control

Samples were properly packaged for shipment and transferred by courier to the laboratory for analysis. A signed chain-of-custody record (included in Appendix D) with sample numbers and locations was enclosed with each shipment. When transferring the possession of samples, the individuals relinquishing and receiving the samples signed, dated, and noted the time on the record. All shipments were in compliance with applicable U.S. Department of Transportation (DOT) regulations for environmental samples.

QA/QC samples for this project included field blanks, trip blanks, QC field duplicates, QA split samples, laboratory method blanks, laboratory control samples (LCS), laboratory duplicates, and matrix spike/matrix spike duplicate (MS/MSD) samples. Table 4-5 presents a summary of QA/QC samples utilized during the PBA08 RI and how each sample type was used to support the quality of the analytical data. Evaluation of QA/QC samples and their contribution to documenting the project data quality is provided in Appendix C.

Table 4-5. Summary of PBA08 RI QA/QC Samples

Sample Type	Rationale
Field Blank	Analyzed to determine contamination in source material that may contribute to sample contamination
Trip Blank	Analyzed to assess the potential for cross contamination of samples due to contaminant interference during sample shipment and storage
Field Duplicate	Analyzed to determine sample heterogeneity and sampling methodology reproducibility
Equipment Rinsate	Analyzed to assess the adequacy of the equipment decontamination processes for non-dedicated sampling equipment
Laboratory Method Blanks	Analyzed to assess the contamination level in the laboratory preparation and analysis process
Laboratory Duplicate Samples	Analyzed to assist in determining the analytical reproducibility and precision of the analysis for the samples of interest and provide information about the effect of the sample matrix on the measurement methodology
Matrix Spike/Matrix Spike Duplicate	
Laboratory Control Sample	Analyzed to determine the accuracy and precision of the analytical method implemented by the laboratory and to monitor the laboratory's analytical process control
QA Split	Analyzed to provide independent verification of the accuracy and precision of the principal analytical laboratory

PBA08 RI = Performance Based Acquisition 2008 Remedial Investigation
QA = Quality Assurance
QC = Quality Control

4.5.3 Field Analyses

No field laboratory analyses were conducted for the PBA08 RI (i.e., field explosives testing). Field screening for organic vapors was not used to guide sampling or analytical efforts. Organic vapors were monitored in the breathing zone during drilling for health and safety purposes at each subsurface soil boring location.

4.5.4 Laboratory Analyses

Samples collected during the PBA08 RI were analyzed by TestAmerica Laboratories, Inc. (herein referred to as TestAmerica) of North Canton, Ohio and West Sacramento, California, as a subcontractor to White Water Associates, Inc., of Amasa, Michigan. Collected QA split samples were analyzed by USACE's contracted QA laboratory, RTI Laboratories, Inc., of Livonia, Michigan.

TestAmerica and RTI Laboratories, Inc. are accredited by the DoD Environmental Laboratory Accreditation Program (ELAP).

All analytical procedures were completed in accordance with applicable professional standards, USEPA requirements, government regulations and guidelines, DoD Quality Systems Manual (QSM) Version 3, USACE Louisville District analytical QA guidelines, and specific project goals and requirements. In addition to these standards, strict adherence to the requirements set forth in the FWSAP and PBA08 SAP was required of the analytical laboratories so that conditions adverse to data quality would not arise. Preparation and analyses for chemical parameters were performed according to the methods listed in Table 4-6. Additionally, soil geotechnical analysis for porosity, bulk density, moisture content, grain size fraction, and permeability were performed in compliance with American Society for Testing and Materials (ASTM) test methods.

Table 4-6. Summary of PBA08 RI Preparation and Analytical Procedures

Parameter	Soil	
	Preparation	**Analysis**
Inorganic chemicals	SW-846 3050B	SW-846 6020
Mercury	--	SW-846 7471A
Explosives	--	SW-846 8330B

SVOC = Semi-volatile Organic Compound
VOC = Volatile Organic Compound
-- = Preparation steps included in analytical method

SAIC is the custodian of the project files and will maintain the contents of the files for this investigation, including all relevant records, reports, logs, field notebooks, photographs, subcontractor reports, correspondence, and sample custody forms. These files will remain in a secure area under the custody of the SAIC project manager until they are transferred to USACE, Louisville District and RVAAP at the end of the PBA08 project. Analytical data reports from the project laboratory will be forwarded to the USACE Louisville District laboratory data validation contractor for validation review and QA comparison upon request. White Water Associates, Inc. and TestAmerica will retain all original raw data (both hardcopy and electronic) in a secure area under the custody of the laboratory project manager for a minimum of seven years.

4.5.5 Data Review, Verification, and Quality Assessment

Data were produced, reviewed, and reported by the laboratory in accordance with specifications in the PBA08 SAP, the Louisville District analytical QA guidelines, and the laboratory's QA manual.

TestAmerica performed in-house analytical data reduction under the direction of the laboratory project manager and QA officer. These individuals were responsible for assessing data quality and informing SAIC and USACE of any data considered "unacceptable" or which required caution on the part of the data user in terms of its reliability.

Final reports were generated by the laboratory project manager. Data were then delivered to SAIC for data verification. TestAmerica prepared and retained full analytical and QC documentation for the project in both paper copy and electronic storage media (e.g., compact disk), as directed by the analytical methodologies employed. Laboratory reports included documentation verifying analytical holding time compliance.

SAIC performed a systematic process utilizing automated data review (ADR) software for data verification to ensure the precision and accuracy of the analytical data were adequate for their intended use. The ADR outlier reports are included in Attachment 1 of Appendix C. This verification also attempted to minimize the potential of using false-positive or false-negative results in the decision-making process (i.e., to ensure accurate identification of detected versus non-detected chemicals). This approach was consistent with the DQOs for the project and with the analytical methods used for determining COCs and calculating risk. "Definitive Data" were reported consistent with the deliverables identified in the project sampling and analysis plan (SAP). These definitive data were then verified through the review process outlined in the project SAP and presented in Appendix C. During the review process, no data were qualified as unusable; however, some results were qualified as estimated, indicating accuracy, precision, or sensitivity was less than desired but adequate for their intended use. The completeness goal for analytical data is 90%, as defined in Tables 3-1 and 3-2 of the Facility-Wide Quality Assurance Project Plan (FWQAPP). The project achieved this goal by collecting all samples presented in the PBA08 SAP and producing usable results for 100% of all samples performed. In addition to the SAIC data review, a 10% validation of all data will be performed by USACE to prove data usability.

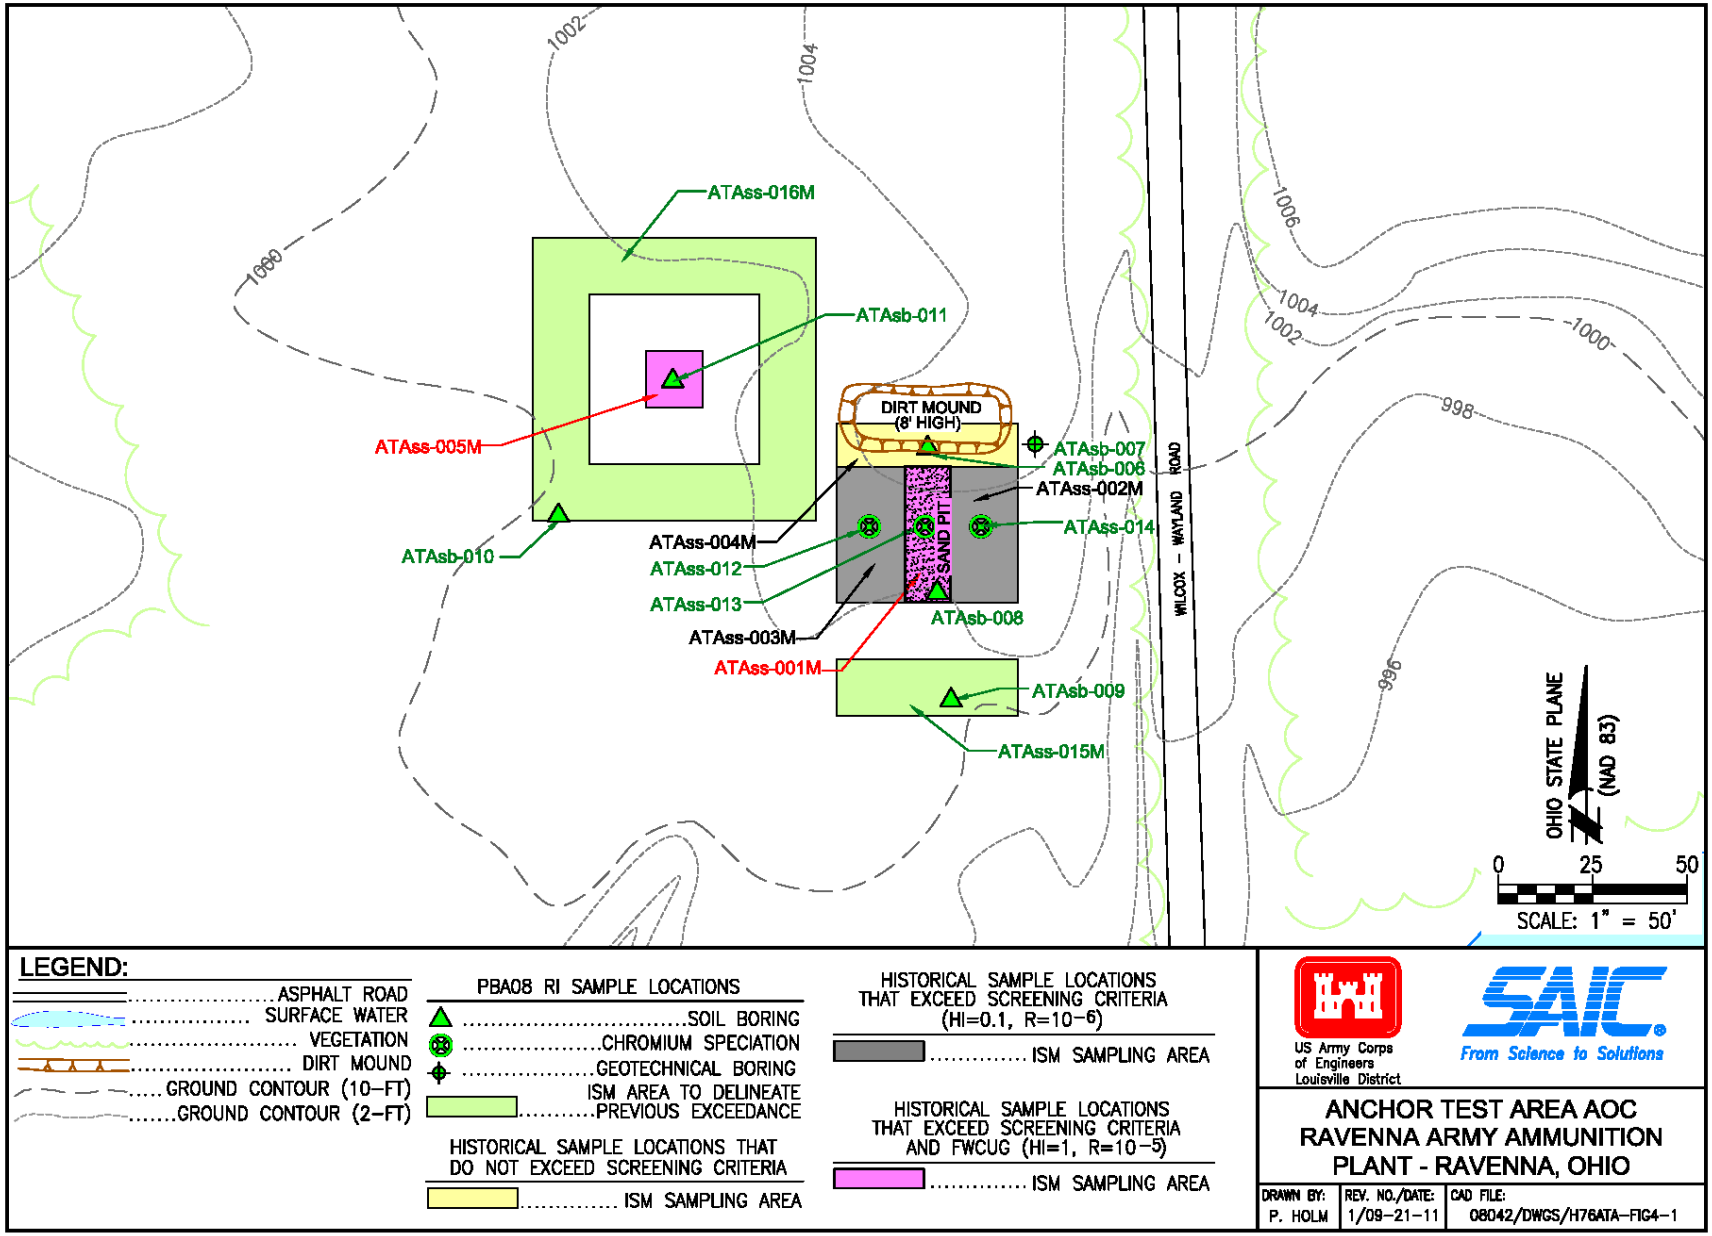

Figure 4-1. PBA08 RI and Historical Sample Locations

THIS PAGE INTENTIONALLY LEFT BLANK.

5.0 NATURE AND EXTENT OF CONTAMINATION

This section presents results of analytical data obtained during the PBA08 RI, the data screening process to identify SRCs indicative of potential impacts from AOC operations, and nature and extent of SRCs in environmental media at Anchor Test Area. The data incorporated in this evaluation included samples from previous investigations.

Section 5.1 presents the statistical methods and screening processes used to distinguish chemicals present at ambient concentrations (background concentrations) from those present at concentrations that indicate potential impacts related to historical operations within the AOC. Section 5.1 also presents data aggregates based on environmental media, AOC characteristics, and spatial distribution of samples. The nature and extent of contamination in all sampled environmental media is presented in Sections 5.2 through 5.4 [surface soil (discrete and ISM) and subsurface soil]. Surface water and sediment were not sampled or evaluated, as they are not present at this AOC. Each section presents the results of the PBA08 RI, identified SRCs (utilizing historical and current data), and a summary of the nature and extent of SRCs within each environmental media and spatial data aggregate. Summary analytical results are presented in graphical or tabular formats in the sections addressing each data aggregate. Complete analytical results are in Appendix D.

5.1 DATA EVALUATION METHOD

Data evaluation methods for the AOC are consistent with those established in the FWCUG Report. These methods were specified in the PBA08 SAP (USACE 2009a). The processes used to evaluate the analytical data involved three general steps: (1) defining data aggregates; (2) data verification, reduction, and screening; and (3) data presentation.

5.1.1 Definition of Aggregates

Anchor Test Area data were grouped (aggregated) in two ways for evaluation of contaminant nature and extent, HHRA, and ERA. The initial basic aggregation of data was by environmental media (e.g., surface soil, subsurface soil). For each media aggregate, an evaluation was conducted to determine if further aggregation was warranted with respect to AOC characteristics, historical operations, ecological habitat, and potential future remedial strategy and land use (e.g., spatial aggregates). Data for soil were further aggregated based on depth and sample type for consistency with RVAAP human health risk exposure units (EUs) and guidance established in the FWHHRAM and FWCUG Report. Data aggregates for evaluating the nature and extent of contamination at the AOC are as follows:

- Surface Soil (0-1 ft bgs): This medium is evaluated as an AOC-wide aggregate. Further subdivision into spatial aggregates was not warranted due to small size of the AOC, consistent physical characteristics, and limited AOC historical operations.

- Subsurface Soil (> 1 ft bgs): This medium is evaluated as an AOC-wide aggregate on the same basis as surface soil. Subsurface soil samples were collected from 1-4, 4-7, and 7-13 ft bgs intervals.

The soil data aggregates were further subdivided to define human health and ecological risk EUs in the risk assessments as discussed in Section 7.1.1 (e.g., shallow surface soil, deep surface soil, and subsurface soil).

5.1.2 Data Verification, Reduction, and Screening

5.1.2.1 Data Verification

Data verification was performed on 24 surface and subsurface soil samples (including QC duplicates) collected during the PBA08 RI. Analytical results were reported by the laboratory in electronic format and loaded into the Ravenna Environmental Information Management System (REIMS) database. As discussed in Section 4.5.5, data verification was performed to ensure all requested data were received and complete. Data qualifiers were assigned to each result based on the laboratory QA review and verification criteria. Results were qualified as follows:

- "U" not detected;
- "UJ" not detected, reporting limit estimated;
- "J" indicates the analyte was positively identified, but the associated numerical value is an approximate concentration of the analyte in the sample; and
- "R" result not usable.

In addition to assigning qualifiers, the verification process also selected the appropriate result to use when re-analyses or dilutions were performed. Where laboratory surrogate recovery data or laboratory QC samples were outside of analytical method specifications, the verification chemist determined whether laboratory re-analysis should be used in place of an original reported result. If the laboratory reported results for both diluted and undiluted samples, diluted sample results were used for those analytes that exceeded the calibration range of the undiluted sample. Based on the ADR process and verification review, the project produced acceptable results for 100% of the PBA08 RI sample analyses performed. Some results were qualified as estimated ("J" or "UJ") but usable based on indications of accuracy, precision, or sensitivity being less than desired but adequate for interpretation. A complete discussion of verification process results is contained in the data quality summary report (Appendix C). The data quality summary report also includes a summary table of the assigned data qualifiers and the accompanying rationale. Independent, third-party validation of 10% of the PBA08 RI data, and 100% of the USACE QA laboratory data, was performed by a subcontractor to the USACE, Louisville District. Additional qualification of the RI data may be required based on the results of the validation process.

5.1.2.2 Data Reduction

The initial step in the data reduction process to identify SRCs was calculating data summary statistics. Eligible historical and current AOC data were extracted from the database. Results from QC split samples and field duplicate samples, as well as rejected results, were excluded from the data screening process. All chemicals having at least one detected value were included in the data reduction process. Summary statistics calculated for each data aggregate included the minimum, maximum, and average (mean) detected values, and the proportion of detected results to the total number of samples collected. For calculation of mean detected values, non-detected results were addressed by using one-half of the reported detection limit as a surrogate value during calculation of the mean result for each compound. Non-detected results with elevated detection limits (more than 5 times the contract-required detection limit) were excluded from the summary statistics in order not to skew the calculation of mean values.

5.1.2.3 Data Screening

Following reduction, the data were screened to identify SRCs using the processes outlined below. Additional screening of identified SRCs was conducted: (1) in the fate and transport evaluation (Section 6.0) to identify CMCOPCs; (2) in the HHRA (Section 7.2) to identify human health chemicals of potential concern (COPCs) and COCs; and (3) in the ERA (Section 7.3) to evaluate COPECs. Figure 5-1 illustrates the screening process to identify SRCs and COPCs at Anchor Test Area in accordance with the FWCUG Report. The steps involved in the SRC screening are summarized as follows. All chemicals that were not eliminated during the screening steps were retained as SRCs.

- Data quality assessment: Discussed in Section 4.5.5.

- Background screening: the MDC of inorganic chemicals were compared to the RVAAP background concentrations published in *Phase II Remedial Investigation Report for the Winklepeck Burning Grounds* (USACE 2001b). If exceedances above a background concentration occurred, then the respective inorganic chemicals were retained as SRCs. Several inorganic chemicals are screened against a background concentration of 0 mg/kg (e.g., cadmium, silver), as they were not detected in the samples collected during the background study (USACE 2001b). Therefore, any detection of these inorganic chemicals, regardless of magnitude, may result in their identification as SRCs.

- Screening of essential human nutrients: Chemicals that are considered essential nutrients (e.g., calcium, chloride, iodine, iron, magnesium, potassium, phosphorous, and sodium) are an integral part of the human food supply and are often added to foods as supplements. USEPA recommends these chemicals not be evaluated unless they are grossly elevated relative to background concentrations or would exhibit toxicity at the observed concentrations at an AOC (USEPA 1989). Recommended daily allowance (RDA) and recommended daily intake (RDI) values are available for all of these chemicals. Screening values for receptors ingesting 100 mg of soil per day or 1 L of

groundwater per day to meet their RDA/RDI are listed in Table 5-1. In the case of calcium, magnesium, phosphorous, potassium, and sodium, a receptor ingesting 100 mg of soil per day would receive less than the RDA/RDI value, even if the soil consisted of the pure mineral (i.e., soil concentrations at 1,000,000 mg/kg). Essential nutrients detected near or below their RDA/RDI-based screening levels were eliminated as SRCs.

- Frequency of detection/WOE screening: Chemicals that were never detected in a given medium were eliminated as SRCs. For chemicals with at least 20 samples and a frequency of detection of less than 5%, a WOE approach was used to determine if the chemical is AOC-related. The WOE evaluated magnitude and location (clustering) of detected results and if the distribution of detected results indicated a potential source of the chemical. The results were considered spurious, and the chemical was eliminated from further consideration if the detected results for a chemical showed: (1) no clustering; (2) concentrations were not substantially elevated relative to detection limit; and (3) the chemical did not have an evident source. This screen is applied to all organic and inorganic chemicals with the exception of explosives and propellants; all detected explosives and propellants are considered as SRCs regardless of frequency of detection. No frequency of detection/WOE screening was performed for soil because fewer than 20 samples are available for these data sets.

Table 5-1. Recommended Daily Allowances /Recommended Daily Intake Values

Essential Human Nutrient	USDA RDA/RDI[a] Value
Calcium	1000 mg/d
Chloride[b]	3400 mg/d
Iodine	150 µg/d
Iron	8 mg/d
Magnesium	400 mg/d
Potassium[b]	4700 mg/d
Phosphorous	700 mg/d
Sodium[b]	2300 mg/d

[a]Dietary Reference intakes vary by gender and age, values present are for life stage group: Males 19-30 years.
[b]Adequate Intake Value
RDA = Recommended Daily Allowances
RDI = Recommended Daily Intake
USDA = U.S. Department of Agriculture
Values were obtained from http://fnic.nal.usda.gov charts

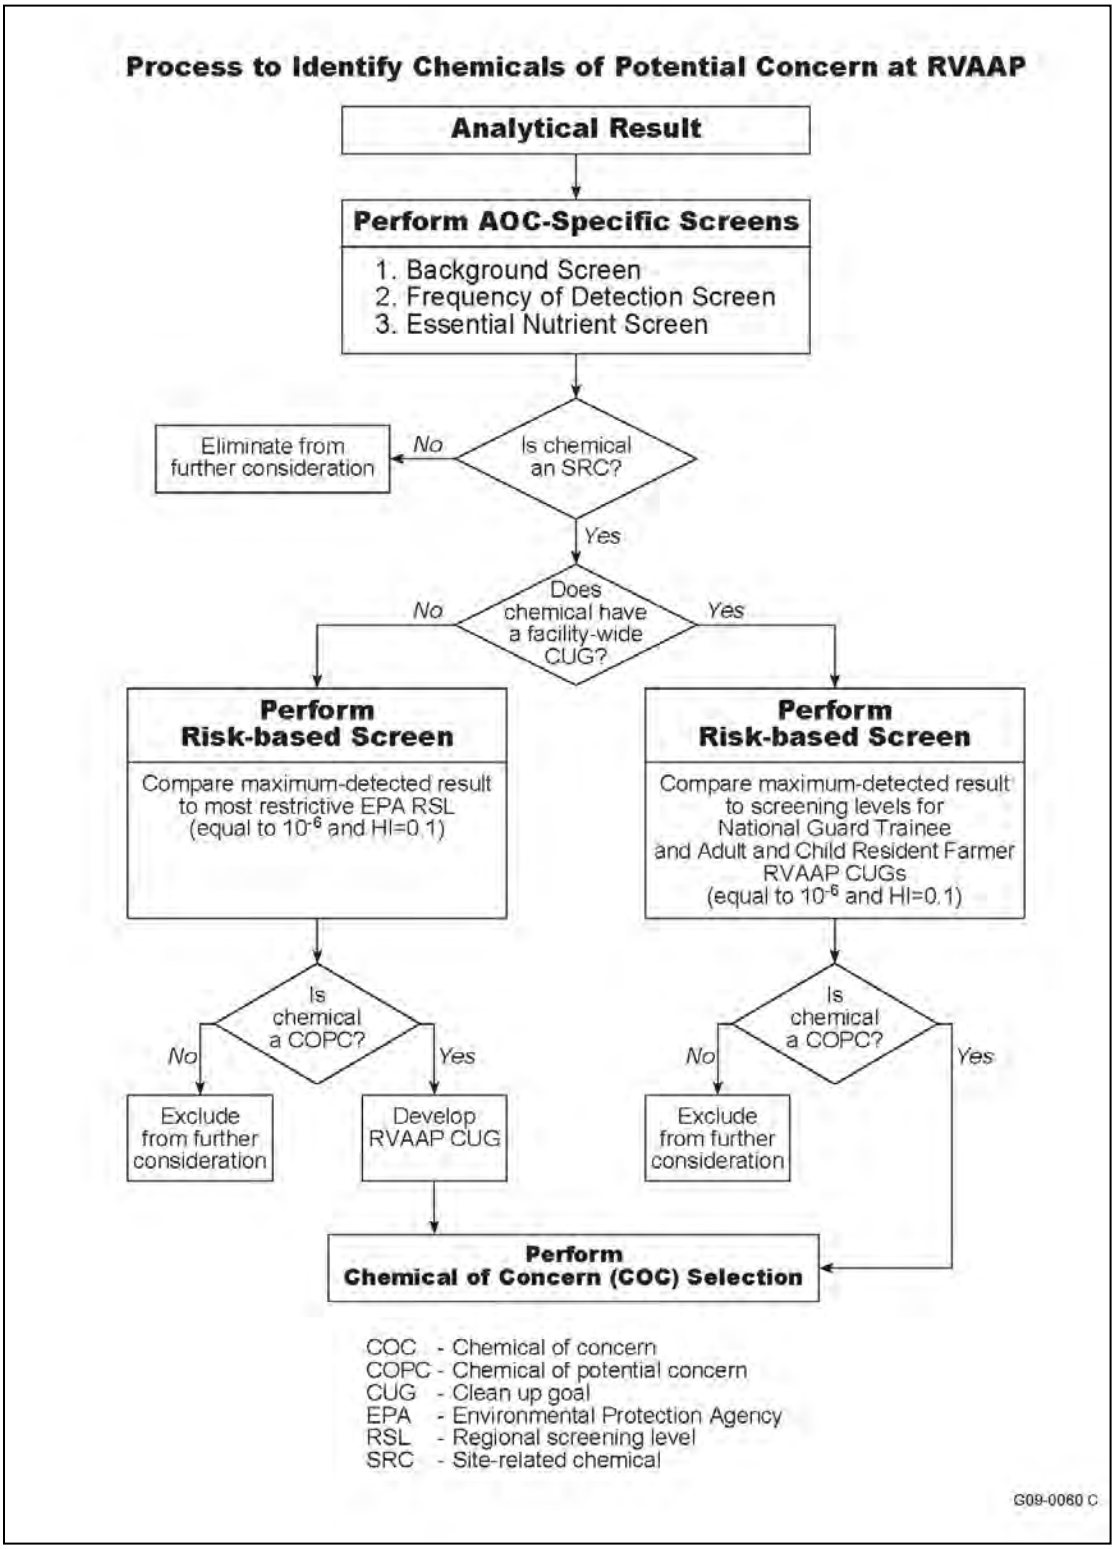

Figure 5-1. Process to Identify RVAAP Chemicals of Potential Concern

5.1.3 Data Presentation

Data summary statistics and screening results for SRCs in surface and subsurface soil are presented in Sections 5.2 through Section 5.4. Analytical results for SRCs are presented by sample location on Figures 5-2 and Figure 5-3. To provide an indication to the nature and extent of contamination, concentrations of SRCs that exceed the lowest FWCUG, based on either the National Guard Trainee or Resident Farmer Adult or Child, are highlighted [TR = 10^{-5} and/or hazard index (HI) = 1.0 or background concentration]; these are further evaluated in Section 7.0. In sections addressing nature and extent of contamination for each media, analytical results for SRCs are also presented in data summary tables whenever a sufficient number of detected values occurred to merit such tables. Where few detected values for a class of SRCs occurred, the values are addressed in the text of the section. Complete analytical results, including all non-detected results, are contained in Appendix D. In order to maximize efficiency for laboratory reporting and data management activities, all of the samples received at the laboratory on a given day were reported in a single data package. Therefore, results may be present in the data packages in Appendix D which are associated with different AOCs. All samples for Anchor Test Area have sample IDs beginning with "ATA." Each table in Appendix D presents the results for each sampling location for a specific medium aggregate (e.g., surface soil, subsurface soil) and class of analytes. Selected chemicals are presented in graphical format to depict spatial and vertical distribution.

5.1.4 Data Evaluation

As discussed in Section 2.2.2, surface soil and subsurface soil samples were collected during the Characterization of 14 AOCs. Surface and subsurface soil samples were also collected during the PBA08 RI. All available sample data were evaluated to determine suitability for use in the various key RI data screens and evaluations (nature and extent, fate and transport, risk assessment). Evaluation of data suitability for use in the PBA08 RI involved two primary considerations: (1) representativeness with respect to current AOC conditions; and (2) sample collection methods (e.g., discrete vs. ISM).

To address use of data for this RI, all available prior and current samples were evaluated with respect to their use for contaminant nature and extent evaluation and risk assessment. In the intervening time between the Characterization of 14 AOCs sampling in 2004 and the PBA08 RI sampling in 2010, no activities were conducted at the AOC that would have resulted in disturbance of media (e.g., re-grading, removal of structures). Therefore, both the data collected in 2004 and PBA08 RI in 2010 are assumed to represent current conditions of the AOC.

All surface and subsurface soil data were incorporated into the contaminant nature and extent evaluation. All historical surface soil samples were collected using ISM methods, screened with the PBA08 RI ISM samples for SRCs, and carried forward into the risk assessment. Discrete samples from the 0-1 ft bgs surface soil interval collected from co-located subsurface soil boring locations during the PBA08 RI were retained for nature and extent evaluation only. All subsurface samples collected during the PBA08 RI were collected as discrete soil borings and screened for SRCs. Two

subsurface samples were collected under the 2004 investigation using a composite method (5 aliquots within an areal extent) at locations ATAss-001M and ATAss-002M. These two subsurface samples were retained for nature and extent evaluation only, due to the difference in collection methodology relative to the PBA08 RI subsurface samples. Table 5-2 presents the designated use for all available Anchor Test Area samples.

5.2 SURFACE SOIL DISCRETE SAMPLE RESULTS FOR CHROMIUM SPECIATION

During the PBA08 RI, surface soil samples were collected from three discrete sample locations and analyzed for hexavalent chromium and total chromium. Samples were collected from the three sampling areas having the highest, mid-point, and lowest total historical chromium results. This sampling was accomplished to determine the contribution of hexavalent chromium to total chromium in soil at Anchor Test Area for use in the HHRA (Section 7.2). Chromium speciation results are shown in Table 5-3.

5.3 CONTAMINANT NATURE AND EXTENT IN SURFACE SOIL

Data from all eligible historical and PBA08 RI surface soil ISM samples were combined and screened, as discussed in Section 5.1, to identify SRCs representing current conditions at the AOC. Table 5-4 presents the results of the SRC screening for surface soil. The SRC screening data is comprised of five ISM samples collected from 0-1 ft bgs in 2004 and two ISM samples collected during the PBA08 RI. The PBA08 RI samples were collected to delineate contaminants detected at previous surface soil sample locations at concentrations above COPC screening levels. One sample was analyzed for TAL metals, explosives, and polycyclic aromatic hydrocarbons (PAHs), and the other sample was analyzed for the RVAAP full-suite analytes (TAL metals, explosives, SVOCs, VOCs, PCBs, pesticides). Tables 5-5 and 5-6 present the results for all detected analytes in the surface soil ISM and discrete samples collected during the PBA08 RI, respectively. Complete copies of all analytical results are presented in Appendix D.

Figures 5-2 and 5-3 graphically present the distribution and concentrations of inorganic and organic SRCs that occur at each sample location. Those SRCs detected in discrete surface soil samples (i.e., the 0-1 ft bgs interval from the subsurface soil boring locations) are also presented on the figures for nature and extent evaluation purposes only. To illustrate the extent and magnitude of contaminants, those SRCs that exceeded the most restrictive FWCUGs at a TR of 10^{-5} and HI=1.0 (or background concentration) are highlighted.

Table 5-2. Data Summary

Sample Id	Date	Sample Type	Use Type	Comments
Surface Soil (0-1 ft bgs)				
ATAsb-006-5127-SO	2/24/2010	D	N	Sample used for nature and extent evaluation. Sample not used for surface soil screening purposes, as ISM data will be used for surface soil screening.
ATAsb-006-6080-FD	2/24/2010	D	FD	Duplicate used for quality control evaluation.
ATAsb-008-5133-SO	2/24/2010	D	N	Sample used for nature and extent evaluation. Sample not used for surface soil screening purposes, as ISM data will be used for surface soil screening.
ATAsb-009-5137-SO	2/24/2010	D	N	Sample used for nature and extent evaluation. Sample not used for surface soil screening purposes, as ISM data will be used for surface soil screening.
ATAsb-010-5141-SO	2/24/2010	D	N	Sample used for nature and extent evaluation. Sample not used for surface soil screening purposes, as ISM data will be used for surface soil screening.
ATAsb-011-5145-SO	2/24/2010	D	N	Sample used for nature and extent evaluation. Sample not used for surface soil screening purposes, as ISM data will be used for surface soil screening.
ATAss-001M-DUP	11/8/2004	ISM	MD	Duplicate used for quality control evaluation.
ATAss-001M-SO	11/8/2004	ISM	S	Sample used for nature and extent evaluation and surface soil screening.
ATAss-002M-SO	11/8/2004	ISM	S	Sample used for nature and extent evaluation and surface soil screening.
ATAss-003D-SO	11/8/2004	ISM	S	Discrete sample taken for determination of volatile organic chemicals in ISM area will be used for screening with ISM samples.
ATAss-003M-SO	11/8/2004	ISM	S	Sample used for nature and extent evaluation and surface soil screening.
ATAss-004M-SO	11/8/2004	ISM	S	Sample used for nature and extent evaluation and surface soil screening.
ATAss-005M-SO	11/8/2004	ISM	S	Sample used for nature and extent evaluation and surface soil screening.
ATAss-012-5033-SO	2/17/2010	D	C	Sample used for chromium speciation and nature and extent evaluation. Sample not used for surface soil screening purposes, as ISM data will be used for surface soil screening.
ATAss-013-5034-SO	2/17/2010	D	C	Sample used for chromium speciation and nature and extent evaluation. Sample not used for surface soil screening purposes, as ISM data will be used for surface soil screening.
ATAss-014-5035-SO	2/17/2010	D	C	Sample used for chromium speciation and nature and extent evaluation. Sample not used for surface soil screening purposes, as ISM data will be used for surface soil screening.
ATAss-015M-5036-SO	2/17/2010	ISM	S	Sample used for nature and extent evaluation and surface soil screening.

Table 5-2. Data Summary (continued)

Sample Id	Date	Sample Type	Use Type	Comments
Surface Soil (0-1 ft bgs), continued				
ATAss-016M-5037-SO	2/17/2010	ISM	S	Sample used for nature and extent evaluation and surface soil screening.
ATAss-016M-6047-FD	2/17/2010	ISM	FD	Duplicate used for quality control evaluation.
Subsurface Soil (1-13 ft bgs)				
ATAsb-001M-SO	11/8/2004	SC	N	Sample used for nature and extent evaluation only because composite sampling method used is different from subsequent discrete subsurface samples taken.
ATAsb-002M-SO	11/8/2004	SC	N	Sample used for nature and extent evaluation only because composite sampling method used is different from subsequent discrete subsurface samples taken.
ATAsb-006-5128-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-006-5129-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-006-5130-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-008-5134-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-008-5135-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-009-5138-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-009-5139-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-009-6081-FD	2/24/2010	D	FD	Duplicate used for quality control evaluation.
ATAsb-010-5142-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-010-5143-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-011-5146-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.
ATAsb-011-5147-SO	2/24/2010	D	S	Sample used for nature and extent evaluation and subsurface soil screening.

C = Chromium speciation sample
COPC = Chemical of Potential Concern
D = Duplicate
FD = Field Duplicate
ISM = Incremental Sampling Method
MD = Incremental Sampling Method Duplicate
N = Nature and Extent use only
S = Nature and extent, SRC and COPC screen, and sample point by sample point risk assessment
SC = Soil Composite
SRC = Site-related Contaminant

Table 5-3. Chromium Speciation Results

Sample Station	Hexavalent Chromium Concentration (mg/kg)	Total Chromium Concentration[a] (mg/kg)	Percent Hexavalent Chromium[b]
ATAss-012	1.1	20.7	5.3
ATAss-013	1 U	16	3.1
ATAss-014	0.93 U	4	11.6

[a]Background screening value (BSV) for total chromium = 17.4 mg/kg. No background screening value is available for hexavalent chromium.
[b]Percentages for non-detected results were calculated using half the reported concentration
mg/kg = milligrams per kilogram
U= non-detectable concentration

5.3.1 Explosives and Propellants

No explosives or propellants were detected or identified as SRCs in the ISM sample population, inclusive of the 2004 and PBA08 RI surface soil samples. The explosive compound pentaerythritol tetranitrate (PETN) was detected in the field duplicate for ISM sample ATAss-016M at a low, estimated concentration of 0.11J mg/kg. However, PETN was not detected in the corresponding primary sample at ATAss-016M under the PBA08 RI (Table 5-5). PBA08 RI surface soil samples confirm the overall absence of explosives and propellants at Anchor Test Area.

5.3.2 Inorganic Chemicals

As shown on Table 5-4, 10 inorganic chemicals (metals) were identified as SRCs from the population of representative surface soil ISM samples at Anchor Test Area. All of these SRCs had a frequency of detection of at least 50% of the ISM sample population, with the exception of thallium (3 of 7 detections). Figure 5-2 illustrates the distribution of inorganic SRCs in surface soil samples collected at Anchor Test Area. Results for the SRCs in discrete surface soil samples collected from the 0-1 ft bgs interval of the subsurface soil borings are also included in Figure 5-2, although these sample results are presented for nature and extent purposes only. Key trends and patterns noted in the distribution of inorganic SRCs are as follows:

- The maximum average concentrations for inorganic SRCs were generally observed at historical ISM sample area ATAss-001M in the vicinity of the former sand pit and the two PBA08 RI ISM samples (ATAss-015M and ATAss-016M). These three samples also contained the most SRCs above background concentrations, with 6 of the 10 SRCs at ATAss-001M and 5 of the 10 SRCs at ATAss-015M and ATAss-016M. Two of the identified inorganic SRCs have a background concentration of 0 mg/kg (i.e., cadmium and thallium). ISM sample ATAss-015M was collected to characterize the area downgradient of the former blast wall, inclusive of historical sample ATAss-001M.

- Arsenic was detected in all seven ISM samples, exceeding its screening levels in one historical sample location ATAss-005M at 54 mg/kg. Arsenic concentrations in all other samples were below the background concentration of 15.4 mg/kg. The PBA08 RI ISM sample location ATAss-016M was selected to delineate the extent of arsenic above screening levels near historical sample ATAss-005M. Arsenic was detected at ATAss-016M at 10 mg/kg, below the background concentration. As shown in Figure 5-2, a discrete soil sample collected from the 0-1 ft bgs interval for PBA08 RI soil boring ATAsb-011 located within the sample boundaries of ATAss-005M also exhibited arsenic concentrations below background concentrations. PBA08 RI sample ATAss-016M delineated the extent of arsenic above background concentrations in this area of the former test pit.

- Barium, beryllium, and manganese are evaluated together because they were detected in all ISM samples but only observed above their background concentrations at one sample location (ATAss-001M collected in 2004). Concentrations of barium and beryllium in the PBA08 RI sample (ATAss-015M) collected downgradient of the former blast walls were approximately one-half of those observed in sample ATAss-001M. Manganese concentrations at downgradient location ATAss-0015M were approximately one-third of those observed at ATAss-001M. A discrete soil sample collected from the 0-1 ft bgs interval at ATAsb-008, within the sample boundaries of ATAss-001M, exhibited concentrations well below background concentrations for all three of these SRCs.

- Cadmium concentrations were highest in surface soil in the vicinity of the former sand pit (sample ATAss-005M collected in 2004). However, since the concentration range for cadmium in ISM samples is narrow (0.1-0.18 mg/kg), no clear spatial trends are evident that all detections were comparable in magnitude.

- Chromium and nickel are evaluated together because they were detected at their maximum concentrations at the ISM sample location downgradient of the former blast wall area (PBA08 RI sample ATAss-015M). Chromium was detected above its background concentration at various locations (ATAss-002M) throughout the AOC; however, the highest concentrations were associated with the former blast wall area, as the next highest concentration occurred in one of the historical ISM locations upgradient of ATAss-015M. Nickel was detected in all samples collected at the AOC, exceeding its background screening level only in sample ATAss-015M.

- Cobalt and mercury are evaluated together because the highest concentrations of these analytes were detected at PBA08 RI ISM sample location ATAss-016M. Cobalt was detected in all ISM samples collected at the AOC, only exceeding screening criteria at this location (at 10.6 mg/kg versus a background concentration of 10.4 mg/kg). Mercury was observed above background screening levels at the majority of ISM locations at the AOC, although these detections comprised a generally narrow concentration range (0.038-0.062 mg/kg) and consequently do not exhibit any significant trends in spatial distribution.

- Thallium was detected in three samples and has a screening level of 0 mg/kg. The maximum concentration was observed at historical location ATAss-003M at the former blast mound area. Thallium was also detected at the ISM area downgradient of the former blast mound area (PBA08 RI sample ATAss-015M) and the ISM sample area delineating the former test pit (PBA08 RI sample ATAss-016M).

Table 5-4. SRC Screening Summary for Surface Soil

Analyte	CAS Number	Freq of Detect[a]	Minimum Detect	Maximum Detect	Average Result	Background Criteria[b]	SRC? (yes/no)	SRC Justification
Inorganic chemicals (mg/kg)

5.3.3 Semi-volatile Organic Compounds

A total of 4 SVOCs were identified as SRCs from the population of representative ISM samples (Table 5-4). All SVOCs identified as SRCs were PAHs, with the exception of bis(2-ethylhexyl)phthalate. Figure 5-2 illustrates the distribution of SVOCs exceeding screening levels in surface soil.

Bis(2-ethylhexyl)phthalate, 2-methylnapthalene, and naphthalene were detected at PBA08 RI sample location ATAss-015M. Benzo(b)fluoranthene was detected in the 2004 sample from location ATAss-003M. All of these detections were estimated levels less than reporting limits.

5.3.4 Volatile Organic Compounds, Pesticides, and Polychlorinated Biphenyls

No VOCs, pesticides, or PCBs were detected or identified as SRCs in surface soil at this AOC.

5.4 CONTAMINANT NATURE AND EXTENT IN SUBSURFACE SOIL

Five soil borings were completed at Anchor Test Area during the PBA08 RI to define the vertical extent of contamination in subsurface soil. Bedrock was not encountered in any of the subsurface borings advanced. Groundwater was generally encountered at depths of approximately 8.7-13 ft bgs across the AOC. Discrete subsurface soil samples were collected from the 1.0-4.0 ft bgs and 4.0-7.0 ft bgs intervals at all five boring locations, with an additional sample from the 7.0-13.0 ft bgs interval collected at location ATAsb-006. During the previous investigation at Anchor Test Area, two subsurface soil samples were collected from locations ATAss-001M and ATAss-002M. However, these were not discrete samples but composite samples comprised of five aliquots per sample area. Due to the difference in sampling methodology, the historical samples at ATAss-001M and ATAss-002M were used for contaminant nature and extent purposes (Figure 5-3) but were not incorporated into the SRC screening process.

Nine samples from the PBA08 RI subsurface soil borings were analyzed for TAL metals and explosives; two samples, both intervals at station ATAsb-008, were analyzed for RVAAP full-suite analytes (TAL metals, explosives, SVOCs, VOCs, PCBs, pesticides). Table 5-7 presents the results of the SRC screening for subsurface soil samples, and Table 5-8 summarizes the analytical results for all detected analytes. Complete copies of all analytical results are presented in Appendix D. Figure 5-3 illustrates the distribution of identified subsurface soil of SRCs in all samples collected at Anchor Test Area.

*** = result exceeds background concentration**

5.4.1 Explosives and Propellants

No explosives or propellants were detected or identified as SRCs in subsurface soil samples at this AOC.

5.4.2 Inorganic Chemicals

A total of two inorganic chemicals (cadmium and silver) were identified as SRCs in subsurface soil samples. A background concentration of 0 mg/kg is utilized in the SRC screen for these metals. As shown on Figure 5-3, the majority of detections for cadmium and silver were at low, estimated concentrations (less than reporting limits).

No trends are evident in the distribution of silver and cadmium at the AOC, either spatially or with respect to vertical extent in surface soil (> 1 ft bgs). Both inorganic chemicals exhibited a limited concentration range, from 0.042 to 0.086 mg/kg for cadmium and from 0.011 to 0.023 mg/kg for silver. The maximum concentration for cadmium was observed at soil boring location ATAsb-006 in the 7.0-13.0 ft bgs interval. For silver, the maximum concentration was detected at soil boring location ATAsb-010 in the 4.0-7.0 ft bgs. Neither silver nor cadmium were detected in either of the historical subsurface soil samples collected at ATAss-001M or ATAss-002M. As shown in Figure 5-2, detected cadmium concentrations in surface soil (< 1 ft bgs) were marginally higher than those observed in the subsurface soil samples. Silver was not detected in any of the ISM or discrete surface soil samples.

5.4.3 Semi-volatile Organic Compounds

The SVOC bis(2-ethylhexyl)phthalate was detected at sample location ATAsb-008 in the 4.0-7.0 ft bgs interval at a low, estimated concentration (less than the laboratory reporting limit); therefore, identified as an SRC. No SVOCs were detected in the 1.0-4.0 ft bgs sample interval from this location.

5.4.4 Volatile Organic Compounds, Pesticides, and Polychlorinated Biphenyls

Two VOCs (methylene chloride and toluene) were detected at sample location ATAsb-008. Toluene was detected in both the 1.0-4.0 and 4.0-7.0 ft bgs sample intervals from this location, and methylene chloride was detected only in the sample collected at 4.0-7.0 ft bgs. All VOC detections at ATAsb-008 were at low, estimated concentrations (less than the laboratory reporting limit). Pesticides and PCBs were not detected at sample location ATAsb-008.

5.5 GEOTECHNICAL SUBSURFACE SOIL SAMPLE

Two samples were collected at intervals of 4.0-4.9 and 10.0-12.0 ft bgs from one soil boring (ATAsb-007) for the purpose of obtaining geotechnical parameters to perform vadose zone soil leaching and groundwater transport modeling. Table 5-9 summarizes the results of the geotechnical

characteristics of Anchor Test Area soil. Complete copies of analytical and test results are presented in Appendix D.

Table 5-9. Summary of Geotechnical Parameters

Parameters	Sample ID	
	ATAsb-007-5131-SO	ATAsb-007-5132-SO
Collection depth	4.0-4.9 ft bgs	10.0-12.0 ft bgs

Total organic carbon	1,100 mg/kg	580J mg/kg
Size fraction analysis	1.1% gravel, 17.3% sand, 39.8% silt, 41.9% clay	39.1 % sand, 60.2 % silt, 0.7 % clay
Permeability (K)	4.9E-07 cm/sec	1.3E-04 cm/sec

J = estimated value
bgs = below ground surface

5.6 SUMMARY OF CONTAMINANT NATURE AND EXTENT

Between the two media (surface and subsurface soil) evaluated, surface soil (0-1 ft bgs) contains the majority of the SRCs. Fourteen SRCs were identified in surface soil (0-1 ft bgs) and five SRCs were identified in subsurface soil (>1 ft bgs). Only cadmium and bis(2-ethylhexyl)phthalate were identified as SRCs in both media.

5.6.1 Surface Soil

The highest concentrations of inorganic SRCs were generally observed in historical ISM sample location ATAss-005M, the historical ISM sample area in the vicinity of the former blast wall mounds (ATAss-001M), and the two PBA08 RI ISM samples (ATAss-015M and ATAss-016M). These four samples also contained the greatest number of inorganic SRCs above background concentrations, although two of the surface soil SRCs have an established background concentration of 0 mg/kg. Four SVOCs were identified as SRCs at the AOC, with three of these SVOCs occurring at one sample location (ATAss-015M). No explosives, propellants, VOCs, pesticides, or PCBs were detected or identified as SRCs in surface soil at this AOC.

5.6.2 Subsurface Soil

Soil overburden is greater than 13 ft in thickness across the AOC, with groundwater encountered at approximately 8.7-13 ft bgs. Cadmium and silver were ubiquitous in the subsurface soil samples, although no spatial or vertical trends were evident and both metals occurred within a narrow range of concentrations. One SVOC [bis(2-ethylhexy)phthalate] and two VOCs (methylene chloride and toluene) were detected at location ATAsb-008; all three organic chemicals were detected in the 4.0-7.0 ft bgs interval, and one VOC was detected in the 1.0-4.0 ft bgs interval. Explosives, propellants, pesticides, and PCBs were not detected in any subsurface soil sample.

6.0 CONTAMINANT FATE AND TRANSPORT

Contaminant fate and transport evaluation assesses the potential for contaminants to leach from surface and subsurface soil sources at Anchor Test Area and impact groundwater beneath the sources and downgradient receptor locations. This evaluation is included in the decision-making process to determine whether remedial actions of sources may be necessary to protect groundwater resources. Only SRCs found in the surface soil and subsurface soil sample aggregates are evaluated in the fate and transport assessment for this AOC.

Computer-based contaminant fate and transport analyses were performed to predict the rate of contaminant migration through soil to groundwater (i.e., transport media) and to conservatively estimate future contaminant concentrations beneath the source. Fate and transport modeling was used to simulate vertical transport of contaminants from surface and subsurface soil sources in the AOC containing maximum observed SRCs to groundwater, as well as mixing of leachate with the saturated groundwater system beneath the source area. A summary of the principles of contaminant fate and transport is presented in this section along with the results of the screening-level modeling evaluations.

Section 6.1 describes the physical and chemical properties of the SRCs found in soil at the AOC. Section 6.2 presents a conceptual model for contaminant fate and transport that considers AOC topography, hydrogeology, contaminant sources, and release mechanisms. Section 6.3 presents a soil screening analysis to identify SRCs with the potential to migrate from soil to groundwater as initial CMCOPCs. Section 6.4 describes fate and transport modeling and presents CMCOCs. The summary and conclusions of the fate and transport analyses are presented in Section 6.5.

6.1 PHYSICAL AND CHEMICAL PROPERTIES OF SITE-RELATED CONTAMINANTS

Surface and subsurface soil SRCs (including 11 inorganic chemicals and 6 organic chemicals) were developed in Section 5.0 and are summarized below:

- Inorganic SRCs in surface and subsurface soil include: arsenic, barium, beryllium, cadmium, chromium, cobalt, manganese, mercury, nickel, silver, and thallium.

- Organic SRCs in surface and subsurface soil include: 2-methylnaphthalene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate, naphthalene, methylene chloride, and toluene.

These inorganic and organic SRCs are in continuous chemical and physical interaction with ambient surface and subsurface environments. The observed distributions of chemical concentrations in the environment are the result of these interactions. These interactions also determine the chemical fate of this material. Chemicals released into the environment are susceptible to several degradation pathways including hydrolysis, oxidation, reduction, isomerization, photolysis, photo-oxidation, biotransformation, and biodegradation. Transformation products resulting from these processes may behave differently than their parent compound in the environment.

The migration of chemicals is governed by the physical and chemical properties of the chemicals and the surface and subsurface media through which the chemicals are transferred. In general, chemicals and structures with similar physical and chemical characteristics will show similar patterns of transformation, transport, or attenuation in the environment. Solubility, vapor pressure data, chemical partitioning coefficients, degradation rates, and Henry's Law Constant (HLC) provide information that can be used to evaluate contaminant mobility in the environment. Partitioning coefficients are used to assess the relative affinities of chemicals for solution or solid phase adsorption. However, the synergistic effects of multiple migrating chemicals and the complexity of soil/water interactions, including pH and oxidation-reduction potential (Eh), grain size, and clay mineral variability, are typically unknown.

The physical properties of the chemicals defined as SRCs in surface and subsurface soil are summarized in Tables E-1 and E-2 in Appendix E. The properties are used to assess the anticipated behavior of each chemical under environmental conditions.

6.1.1 Chemical Factors Affecting Fate and Transport

The water solubility of a chemical is a measure of the saturated concentration of the chemical in water at a given temperature and pressure. The tendency for a chemical to be transported by groundwater is directly related to its solubility and inversely related to both its tendencies to adsorb to soil and to volatilize from water (OGE 1988). Chemicals with high water solubilities tend to desorb from soil, are less likely to volatilize from water, and are susceptible to biodegradation. The water solubility of a compound varies with temperature, pH, and the presence of other dissolved chemicals (including organic carbon and humic acids).

The octanol-water partition coefficient (K_{ow}) can be used to estimate the tendency for a chemical to partition between environmental phases of different polarity. The K_{ow} is a laboratory-determined ratio of the concentration of a chemical in the n-octanol phase of a two-phase system to the concentration in the water phase. Chemicals with log K_{ow} values less than 1 are highly hydrophilic, while chemicals with log K_{ow} values greater than 4 will partition to soil particles (Lyman et al. 1990).

The water/organic carbon partition coefficient (K_{oc}) is a measure of the tendency of an organic chemical to partition between water and organic carbon in the soil. The K_{oc} is defined as the ratio of the absorbed chemical per unit weight of organic carbon to the aqueous solute concentration. This coefficient can be used to estimate the degree to which an organic chemical will adsorb to soil and, thus, not migrate with groundwater. The higher the K_{oc} value, the greater is the tendency of the chemical to partition into soil (OGE 1988). The sorption coefficient (K_d) is calculated by multiplying the K_{oc} value by the fraction of organic carbon in the soil.

Vapor pressure is a measure of the pressure at which a chemical and its vapor are in equilibrium. The value can be used to determine the extent to which a compound would travel in air, as well as the rate of volatilization from soil and solution (OGE 1988). In general, chemicals with vapor pressures lower than 10^{-7} mm mercury will not be present in the atmosphere or air spaces in soil in significant amounts, while

chemicals with vapor pressures higher than 10^{-2} mm mercury will exist primarily in the air (Dragun 1988).

The HLC value for a chemical is a measure of the ratio of the chemical's vapor pressure to its aqueous solubility. The HLC value can be used to make general predictions about the chemical's tendency to volatilize from water. Substances with HLC values less than 10^{-7} atm-m^3/mol will generally volatilize slowly, while chemicals with an HLC greater than 10^{-3} atm-m^3/mol will volatilize rapidly (Lyman et al. 1990).

6.1.2 Biodegradation

Organic chemicals with differing chemical structures will biodegrade at different rates. Primary biodegradation consists of any biologically-induced structural change in an organic chemical. Complete biodegradation is the biologically-mediated degradation of an organic chemical into carbon dioxide, water, oxygen, and other metabolic inorganic products (Dragun 1988). The first order biodegradation rate of an organic chemical is proportional to the concentration:

$$-dC/dt = kC \qquad \text{(Equation 6-1)}$$

Where:

C = concentration
t = time
k = biodegradation rate constant = $\ln 2 / t_{1/2}$
$t_{1/2}$ = biodegradation half-life

The biodegradation half-life is the time necessary for half of the chemical to degrade. The biodegradation rate of an organic chemical is generally dependent on the presence and population size of soil microorganisms that are capable of degrading the chemical.

6.1.3 Inorganic Chemicals

Inorganic chemicals detected in soil samples are associated with both the aqueous phase and with leachable metal ions on soil particles. The transport of this material from unsaturated soil to the underlying groundwater is controlled by the physical processes of precipitation, percolation, chemical interaction with the soil, and downward transport of metal ions by continued percolation. The chemistry of inorganic interaction with percolating precipitation and varying soil conditions is complex and includes numerous chemical transformations that may result in altered oxidation states, ion exchange, adsorption, precipitation, or complexation. The chemical reactions, which are affected by environmental conditions including pH, oxidation/reduction conditions, and the type and amount of organic matter, clay, and the presence of hydrous oxides, may act to enhance or reduce the mobility and toxicity of the metal ions. In general, these reactions are reversible and add to the variability commonly observed in distributions of inorganic chemicals in soil.

The chemical form of an inorganic chemical determines its solubility and mobility in the environment; however, chemical speciation is complex and difficult to delineate in routine laboratory analysis. Inorganic chemicals in soil are commonly found in several forms, including dissolved concentrations in soil pore water, metal ions occupying exchange sites on inorganic soil chemicals (adsorbed to inorganic soil chemicals), metal ions associated with insoluble organic matter, precipitated inorganic chemicals as pure or mixed solids, and metal ions present in the structure of primary or secondary minerals.

The dissolved (aqueous) fraction and its equilibrium sorbed fraction are of primary importance when considering the migration potential of inorganic chemicals through soil. Of the inorganic chemicals that are likely to form, chlorides, nitrates, and nitrites are commonly the most soluble. Sulfate, carbonate, and hydroxides generally have low to moderate solubility. Soluble chemicals are transported in aqueous form subject to attenuation, whereas less soluble chemicals remain as a precipitate and limit the overall dissolution of the metal ions. The solubility of the metal ions is also regulated by ambient chemical conditions, including pH and oxidation/reduction.

The attenuation of metal ions in the environment can be estimated numerically using the retardation factor (R), dispersion in higher flow systems (high conductivity environments), and diffusion in low conductivity environments. R defines the extent to which the velocity of the contaminant is slowed which is largely derived from the soil/water partitioning coefficient (K_d). The retardation factor is calculated using the following equation:

$$R = 1 + (K_d \rho_b)/\theta_w \qquad \text{(Equation 6-2)}$$

Where:

ρ_b = the soil bulk dry density (g/cm^3)

θ_w = soil moisture content (dimensionless)

Metal ion concentrations in the environment do not attenuate by natural or biological degradation because of low volatility and solubility of the ions. Inorganic chemicals may be biotransformed or bioconcentrated through microbial activity.

6.1.4 Organic Chemicals

Organic chemicals, such as SVOCs or VOCs, detected in soil may be transformed or degraded in the environment by various processes, including hydrolysis, oxidation/reduction, photolysis, volatilization, biodegradation, or biotransformation. The half-life of organic chemicals in the transport media can vary from minutes to years, depending on environmental conditions and the chemical structures of the chemicals. Some types of organic chemicals are very stable, and degradation rates can be very slow. Organic degradation may either enhance (through the production of more toxic byproducts) or reduce (through concentration reduction) the toxicity of a chemical in the environment.

6.2 CONCEPTUAL MODEL FOR FATE AND TRANSPORT

The CSM, which defines the framework for fate and transport modeling, describes conditions at Anchor Test Area including the contaminant sources, surficial and subsurface hydrogeologic conditions, contaminant migration and pathways, and the contaminant release mechanisms.

AOC conditions described in Sections 2.0 through 5.0 include contaminant source information, the surrounding geologic and hydrologic conditions, and the magnitude of SRCs and their current spatial distribution. Information from the preliminary CSM presented in Section 3.7 and the nature and extent evaluation in Section 5.0 were used to develop the CSM for fate and transport modeling by identifying SRCs and migration pathways. The CSM is based on information and data collected for historical investigations, this RI report and informed assumptions about the AOC. Assumptions contained in the CSM are reiterated throughout this section. The better the information and the greater the accuracy of the assumptions, the more accurately the CSM describes the AOC and, therefore, the more reliable the fate and transport modeling predictions can be. A summary of the salient elements of the CSM that apply to fate and transport modeling are summarized below.

6.2.1 Contaminant Sources

No primary contaminant sources are located at the AOC. Secondary sources (contaminated media) identified in previous investigations and further characterized during the PBA08 RI are described below.

6.2.2 Hydrogeology

A description of the regional and AOC specific geology and hydrology are provided in Section 3.0 and summarized below.

- The topography at Anchor Test Area is relatively flat and slopes slightly to the south and west. Elevations across the AOC vary from approximately 998 to 1004 ft amsl. The AOC is heavily vegetated with mature trees and underbrush (Figure 3-1).

- Soil beneath the AOC consists of silty sands overlain by silt-rich clay observed in subsurface borings installed during the PBA08 RI (Appendix A). Soil across the AOC is moderately permeable, and well drained. No surface water is located at the AOC.

- No groundwater monitoring wells are installed in at the AOC, so only regional hydraulic gradients and flow directions are available as presented in Figures 3-4 and 3-5, respectively. Groundwater was encountered at 8.7-13 ft bgs in PBA08 RI borings, so an average depth of 10 ft bgs is used for modeling.

- Contaminant leaching pathways from soil to the water table are typically through preferential flow paths created from the interbedded sands scattered throughout the smaller-grained unconsolidated soil.

6.2.3 Contaminant Release Mechanisms and Migration Pathways

Based on the information presented above, the following contaminant release mechanisms and migration pathways have been identified at the AOC:

- Contaminant leaching from soil to the water table (vertical migration) and lateral transport to a downgradient receptor;

- Contaminated sediment transported to potential downstream receptors; and

- Contaminated surface water migrating as overland flow to potential downstream receptors.

The first of these, which considers a primary groundwater transport pathway, is treated explicitly in this fate and transport section. Sediment transport and surface water transport pathways are evaluated in the ERA presented in Section 7.3.

One of the principal migration pathways at the AOC is percolation through the unsaturated soil to the water table (i.e., vertical leaching of contaminants from soil into groundwater). However, because of the very heterogeneous nature of the unconsolidated glacial material, groundwater flow patterns within the unconsolidated soil are difficult to predict. Precipitation that does not leave the AOC as surface runoff percolates into the subsurface. Some of the percolating water leaves this environment via evapotranspiration after little or no vertical migration. The remainder of the water percolates into the water table. As discussed in Section 6.2.4, the rate of percolation is controlled by soil cover, ground slope, saturated conductivity of the soil, and meteorological conditions. Figure 6-1 illustrates the contaminant migration conceptual model.

Once the contaminant leachate percolates through the soil and reaches the water table, it migrates with the local groundwater and discharges at the downgradient streams. Groundwater flow likely occurs along preferential pathways (e.g., sand seams, channel deposits, or other stratigraphic discontinuities) having higher permeabilities. For the inorganic chemicals, lateral migration through groundwater will be very limited due to their high retardation by the bedrock material (USACE 2002).

Additional factors that affect the leaching rate include a chemical's solubility, sorption capacity (expressed by the K_d), and the amount of percolation. Insoluble chemicals will precipitate out of solution in the subsurface, or remain in insoluble forms with little leaching.

Another factor that affects whether a chemical will reach the water table through percolation of precipitation is the chemical's rate of decay. Most of the organic chemicals decay at characteristic

rates that are proportional to the chemical's half-life. For a given percolation rate, those chemicals with long half-lives have a greater potential for contaminating groundwater than do those with shorter half-lives. For this analysis, the rate of decay/half-life was not considered.

Contaminant releases through gaseous emissions and airborne particulates are not significant at Anchor Test Area. The AOC is vegetated, located in a humid temperate climate, and soil moisture content is typically high, which prevents dust borne contaminant migration. Therefore, there is likely little to no gaseous emission, and contaminant levels in the air pathway are minor to nonexistent.

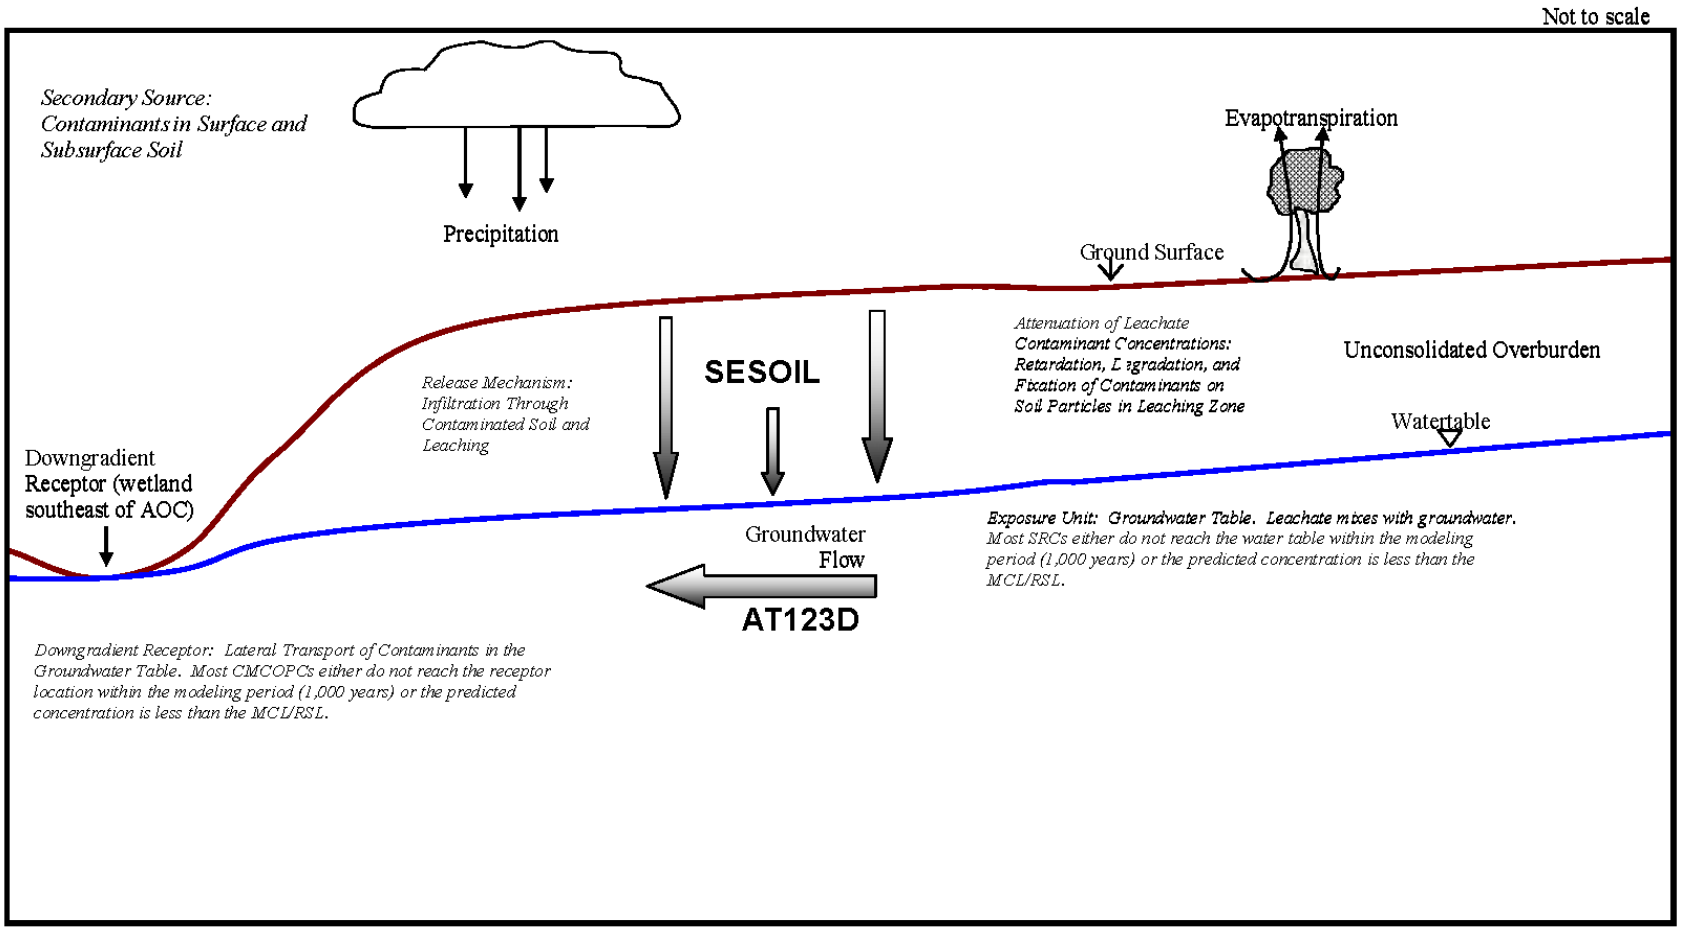

Figure 6-1. Contaminant Migration Conceptual Model

6.2.4 Water Budget

The potential for contaminant transport begins with precipitation. Percolation is the driving mechanism for leaching of soil contaminants to groundwater. The actual amount of rainwater available for flow and percolation to groundwater is highly variable and dependent upon soil type and climatic conditions. A water balance calculation can be used as a tool to quantitatively account for all the components of the hydrologic cycle. The quantified elements of the water balance are used for inputs to the soil leaching and groundwater transport models discussed later. The components of a simple steady-state water balance model include precipitation (P), evapotranspiration (ET), surface runoff (Sr), and groundwater recharge or percolation (q). These terms are defined as follows:

$$P = ET + Sr + q \qquad \text{(Equation 6-3)}$$

or

$$\text{Rainwater available for flow} = Sr + q = P - ET \qquad \text{(Equation 6-4)}$$

It is expected that loss of runoff also occurs in the form of evaporation. The remaining water after runoff and evaporation is available for percolation, which includes loss to the atmosphere by evapotranspiration. The water balance estimations were developed using the Hydrologic Evaluation of Landfill Performance (HELP) model (USEPA 1994). See Table E-3 in Appendix E for parameters used in the HELP model to develop the water budget estimates used in the evaluation. Calculations using precipitation and temperature data for a 100-year period were generated synthetically using coefficients for Cleveland, Ohio.

The annual average water balance estimates indicate an evapotranspiration of 28% (10.3 inches) of total precipitation (37 inches). The remaining 72% (27 inches) of rainwater is available for surface water runoff and percolation to groundwater. Of the 27 inches of water available for runoff or percolation, groundwater recharge (percolation) accounts for 13% (3.6 inches), and surface runoff (along topography to nearest surface water bodies) accounts for the remaining 87% (23.4 inches).

6.3 SOIL SCREENING ANALYSIS

Soil screening analyses are screening evaluations performed to identify SRCs with the potential to leach to groundwater as CMCOPCs. The soil leachability analysis is a five step screening process. Steps include:

1. Identify SRCs for sample aggregates of interest (presented in Section 5.0);

2. Compare the maximum concentration of SRCs with generic soil screening levels (GSSLs) to develop initial CMCOPCs;

3. Compare the maximum concentration of initial CMCOPCs with site-specific soil screening levels (SSSLs) [GSSL multiplied by the site-specific dilution attenuation factor (DAF)] to refine the initial CMCOPCs;

4. Screen the initial CMCOPCs with a travel time leaching analysis of 1,000 years; and

5. Evaluate CMCOPCs using fate and transport models to develop CMCOCs.

The CMCOCs are defined as the chemicals with potential to leach to groundwater and migrate to downgradient receptor locations at a concentration exceeding the FWCUGs for the AOC-specific receptors, facility-wide background concentrations, and maximum contaminant level/regional screening level (MCL/RSL). If a predicted chemical concentration is lower than at least one of these three screening goals, either below the source or at the downgradient receptors, the chemical is not a CMCOC.

6.3.1 Soil Screening Analysis

The first step of the soil screening analysis is the development of SRCs, as presented Section 5.0 and summarized in Section 6.1.

The second step of the screening process involves comparing the maximum concentrations of the SRCs identified in Section 5.0 with MCL-based GSSLs. The GSSLs were developed for Superfund sites for contaminant migration to groundwater (USEPA 1996b, USEPA 2010a). The GSSL is defined as the concentration of a chemical in soil that represents a level of contamination below which there is no concern for impacts to groundwater under CERCLA, provided conditions associated with soil screening levels (SSLs) are met. Generally, if chemical concentrations in soil fall below the GSSL, and there are no groundwater receptors of concern or anticipated exposures, then no further study or action is warranted for that area. If the GSSL for a chemical is not available, the USEPA risk-based (USEPA 2010a) SSL for soil for groundwater migration is used. If neither the USEPA GSSL nor the USEPA risk-based SSL for a chemical is available, then no further evaluation of the chemical is performed and it is eliminated from the list of the initial CMCOPCs.

The initial CMCOPC screen, as presented in Table E-4 in Appendix E, eliminates six inorganic chemicals and five organic chemicals from further consideration. Five inorganic chemicals (arsenic, barium, cobalt, manganese, and thallium) and one organic chemical (naphthalene) exceeded their GSSLs and are carried forward to the next screening step.

The third step of the soil screening process involves comparing the maximum chemical concentrations with the SSSLs. The SSSL is defined as the GSSL multiplied by the AOC-specific DAF. In the derivation of the GSSLs, direct partitioning is used, assuming groundwater is in contact with the chemicals in soil and the groundwater concentration is equal to the leachate concentration. However, as leachate moves through soil, chemical concentrations are attenuated by adsorption and degradation. When the leachate reaches the water table, dilution by groundwater further reduces leachate concentrations. This reduction in concentration can be expressed by a DAF. The DAFs can vary based on AOC-specific characteristics (e.g., hydrogeologic properties, contaminated source area, depth to contamination). As described in the *Soil Screening Guidance: Technical Background Document* (USEPA 1996b), contaminant dilution in groundwater is estimated at each AOC from an AOC-specific DAF. The DAF, which is defined as the ratio of soil leachate concentration to receptor point concentration, is minimally equal to 1. Dilution in groundwater is derived from a simple

mixing zone equation (Equation 6-5), and relies upon estimation of the mixing zone depth (Equation 6-6).

$$DAF = 1 + \frac{(K \times i \times d)}{(q \times L)} \qquad \text{(Equation 6-5)}$$

Where:

DAF = dilution attenuation factor
K = aquifer hydraulic conductivity (m/yr)
i = horizontal hydraulic gradient (m/m)
q = percolation rate (m/yr)
L = source length parallel to groundwater flow (m)
d = mixing zone depth (m) (which is defined below)

$$d = \sqrt{0.0112 \times L^2} + d_a \times \left[1 - \exp\left(\frac{-L \times q}{K \times i \times d_a}\right)\right] \qquad \text{(Equation 6-6)}$$

Where:

d_a = aquifer thickness (m)
$d \leq d_a$

As stated above, if the aquifer thickness is less than the calculated mixing zone depth, then the aquifer thickness is used for "d" in the DAF calculation. The DAF calculation is presented in Table E-5 in Appendix E. It should be noted that the purpose of this screen is not to identify the chemicals that may pose risk at downgradient locations but to target those chemicals that may pose the greatest problem if they migrate from the AOC.

Based on this screening and an AOC-specific DAF of 2.60, only those chemicals that exceeded their published or calculated GSSL multiplied by the DAF were identified as the initial CMCOPCs, based on leaching to groundwater. These initial CMCOPCs, presented in Table E-6 in Appendix E, include three inorganic chemicals (arsenic, cobalt, manganese) and one organic chemical (naphthalene).

The fourth step of the soil screening process involves eliminating from further consideration those initial CMCOPCs identified in the SSSL evaluation which require more than 1,000 years to leach through the unsaturated zone before reaching the water table. The time period of 1,000 years was conservatively selected to evaluate eventual migration of the contaminant front to the water table despite uncertainties in vadose zone hydraulic parameters and groundwater recharge over time. Additionally, USACE (2002) suggests a screening value of 1,000 years be used due to the high uncertainty associated with predicting conditions beyond that time frame. Therefore, the initial CMCOPCs at the selected sources were screened against a travel time of greater than 1,000 years. The travel time in this screen is the time required for a CMCOPC to migrate vertically from the base of the soil interval detected above background concentrations to the water table. This distance is the leaching zone (Lz) evaluated in Table E-7 in Appendix E. The estimated travel time for each initial CMCOPC to reach the water table is determined using the following equations:

$$T = \frac{Lz \times R}{V_p} \qquad \text{(Equation 6-7)}$$

Where:

T = leachate travel time (year)
Lz = thickness of attenuation zone (ft)
R = retardation factor (dimensionless) (Equation 6-2)
V_p = pore water velocity (ft/year)

and

$$V_p = \frac{q}{\theta_w} \qquad \text{(Equation 6-8)}$$

Where:

q = percolation rate (ft/year)
θ_w = fraction of total porosity that is filled by water

If the travel time for a chemical from a source area exceeded 1,000 years, then the chemical was eliminated from the list of initial CMCOPCs. Initial CMCOPCs with travel times less than 1,000 years are retained for further evaluation (Appendix E, Table E-7). The chemicals selected for further evaluation with Seasonal Soil Compartment (SESOIL) modeling are listed in Table 6-1. These include one inorganic chemical (arsenic) and one organic chemical (naphthalene). Cobalt and manganese were eliminated from the list of initial CMCOPCs based on their travel times exceeding 1,000 years.

In the fifth step, the initial CMCOPCs were further evaluated using fate and transport models provided in Section 6.4.

Table 6-1. Initial CMCOPCs Identified from Soil Screening Analysis

Analyte	Maximum Concentrations (mg/kg)	ISM Sample Location	Sample Depth (ft bgs)	Leachate Modeling Required? (Yes/No)
Inorganic chemicals				
Arsenic	5.40E+01	ATAss-005M	1.0-7.0	Yes
Semi-volatile Organic Compounds				
Naphthalene	1.20E-02	ATAss-015M	0.0-1.0	Yes

bgs = below ground surface
CMCOPC = Contaminant Migration Chemical of Potential Concern
ISM = Incremental Sampling Method

6.3.2 Limitations and Assumptions of Soil Screening Analysis

It is important to recognize that acceptable soil concentrations for individual chemicals are highly AOC-specific. The GSSLs used in this screening are based on a number of default assumptions

chosen to be protective of human health for most AOC conditions (USEPA 1996b). These GSSLs are expected to be more conservative than SSSLs based on AOC conditions. The conservative assumptions included in this analysis are: (1) no adsorption in the unsaturated zone or in the aquifer; (2) no biological or chemical degradation in the soil or in the aquifer; and (3) contamination is uniformly distributed throughout the source. However, the GSSL does not incorporate the existence of contamination already present within the aquifer.

6.4 FATE AND TRANSPORT MODELING

Contaminant fate and transport modeling is performed for initial CMCOPCs based on the conceptual model for the AOC, as discussed in Section 6.2. SESOIL modeling was performed for chemicals identified as the initial CMCOPCs from the soil screening analyses presented in Section 6.3 and summarized in Table 6-1. The SESOIL modeling was performed to predict concentrations of chemicals in the leachate immediately beneath the selected source areas and just above the water table. If the predicted leachate concentration of a CMCOPC exceeded its MCL/RSL, facility-wide background concentrations, and FWCUGs for AOC receptors, the Analytical Transient 1-,2-,3-Dimensional (AT123D) model was performed to predict the groundwater concentrations directly beneath the source and downgradient at designated receptor locations. The downgradient receptor location is the closest surface water body feature downgradient of the source areas that is connected to the groundwater.

6.4.1 Modeling Approach

Contaminant transport includes the movement of water and dissolved material from the source areas to groundwater. This occurs as rainwater infiltrates from the surface and percolates through the area of contamination, its surrounding soil, and into the saturated zone. The downward movement of water driven by gravitational potential, capillary pressure, and other components of total fluid potential, mobilizes the contaminants and carries them through the soil into the mixing zone with the water table. Lateral transport within the unconsolidated zone is controlled by the groundwater gradient. Vertical transport (evaluated with the SESOIL model) through the overburden to the water table, and horizontal transport (evaluated with the AT123D model) through the unconsolidated zone to downgradient receptor locations are illustrated in Figure 6-1.

The output of the contaminant fate and transport modeling is presented as the expected maximum concentration of modeled contaminants at the selected receptor locations. For SESOIL, the receptor location is the groundwater table beneath the source area. For this analysis, two ISM sampling areas were considered as sources of contamination based on the results of the soil screening analysis. A separate SESOIL analysis was performed for each initial CMCOPC listed in Table 6-1 and presented on Figure 6-2.

The predicted maximum leachate concentration just above the water table, observed in the SESOIL results, was compared against FWCUGs for the AOC-specific receptors, facility-wide background concentrations, and MCL/RSL. If the predicted maximum leachate concentration of an initial CMCOPC was higher than the FWCUGs, facility-wide background concentrations, and MCL/RSL, the

CMCOPC was further evaluated using the AT123D model to predict future maximum concentrations in groundwater beneath the source, as well as at the receptor locations if applicable. If a predicted maximum leachate concentration was lower than at least one of these three screening goals, the chemical was no longer considered a CMCOPC. The predicted maximum concentration in groundwater directly below the source areas and at the receptor locations, observed in the AT123D results, was compared against the FWCUGs, facility-wide background concentrations, and MCL/RSL. If the predicted maximum concentration of a CMCOPC was higher than the FWCUGs, facility-wide background concentrations, and MCL/RSL, the chemical would be retained as a CMCOC. If a predicted maximum concentration in groundwater directly below the source areas and at the receptor location is lower than at least one of these three screening goals, the chemical is not a CMCOC.

6.4.2 Model Applications

The SESOIL model (GSC 1998) used for leachate modeling, when applicable, estimates pollutant concentrations in the soil profile following introduction via direct application and/or interaction with transport media. The AT123D model (DOE 1992) is an analytical groundwater pollutant fate and transport model. It computes the spatial-temporal concentration distribution of waste in the aquifer system and predicts the transient spread of a contaminant plume through a groundwater aquifer. The application of both of these models is discussed in the following subsections.

6.4.2.1 SESOIL Modeling

The SESOIL model defines the soil column as compartments extending from the ground surface through the unsaturated zone and to the upper level of the saturated soil zone or top of bedrock. Processes simulated in SESOIL are categorized in three cycles: hydrologic cycle, sedimentation cycle, and pollutant cycle. Each cycle is a separate submodule in the SESOIL code. The hydrologic cycle includes rainfall, surface runoff, percolation, soil-water content, evapotranspiration, and groundwater recharge. The sediment washload cycle includes erosion and sediment transport. The pollutant cycle includes convective transport, volatilization, adsorption/desorption, and degradation/decay. A contaminant in SESOIL can partition in up to four phases (liquid, adsorbed, air, and pure).

Data requirements for SESOIL are not extensive and utilize a minimum of site-specific soil and chemical parameters and monthly or seasonal meteorological values as input. Output of the SESOIL model include pollutant concentrations at various soil depths and pollutant loss from the unsaturated soil zone in terms of surface runoff, percolation to groundwater, volatilization, and degradation. The mathematical representations in SESOIL generally consider the rate at which the modeled processes occur, the interaction of different processes with each other, and the initial conditions of both the waste area and the surrounding subsurface matrix material.

The input data for SESOIL can be grouped into four types: climatic data, chemical data, soil data, and application data. There are a total of 61 separate parameters contained in these four data groups. Wherever possible, AOC-specific parameter values were used for the modeling. Certain parameters,

however, were not available for the source areas, and were estimated based on pertinent scientific literature, geochemical investigations, and checks for consistency between model results and historical data. Conservative estimates were used when a range of values existed or parameter values were not available.

6.4.2.2 Climate Data

The climatic data file of SESOIL consists of an array of mean monthly temperature, mean monthly cloud cover fraction, average monthly relative humidity, reflectivity of the earth's surface (i.e., shortwave albedo), average daily evapotranspiration, monthly precipitation, mean number of storm events per month, mean duration of rainfall, and mean length of rainy season. The climatic data are presented in Table E-8 of Appendix E. This data was taken from the Youngstown Weather Service Office Air Port, Ohio, weather station as it was determined to be most appropriate, corresponding to the latitude and the longitude at RVAAP.

Climate data from Youngstown were used for the vertical transport analysis because the SESOIL model had coefficients for Youngstown stored within the SESOIL program. Climate data from Cleveland were used for the soil screening analysis because the HELP model had coefficients for Cleveland stored within the HELP program. Both programs produced virtually the same recharge rate (9.40 cm/yr for Cleveland and 9.42 cm/yr for Youngstown) for each location. Therefore, since the recharge rate was similar in both situations, the weather data stored within each program were used.

6.4.2.3 Chemical Data

The pollutant fate cycle of SESOIL focuses on the various chemical transport and transformation processes that may occur in the soil zone. These processes include volatilization/diffusion, adsorption/desorption, cation exchange, biodegradation and hydrolysis, and metal complexation. The chemical-specific parameters are presented in Appendix E (Table E-9). The distribution coefficients (K_ds) for inorganic chemicals were obtained from *Soil Screening Guidance: Technical Background Document* (USEPA 1996b) assuming a neutral pH of 7, unless stated otherwise. The K_ds for organic chemicals were estimated from organic carbon-based water partition coefficients (K_{oc}) using the relationship
$K_d = (f_{oc})(K_{oc})$, where f_{oc} = soil organic carbon content is the mass fraction obtained from AOC-specific measurements, and K_{oc} values were obtained from *Soil Screening Guidance: Technical Background Document* (USEPA 1996b), unless otherwise stated. In general, biodegradation rates are not applicable for inorganic CMCOPCs and biodegradation was not considered for the organic chemicals in this evaluation.

6.4.2.4 Soil Data

The soil data file of SESOIL contains input parameters describing the physical characteristics of the subsurface soil, and is presented in Table 6-2. The parameters include soil bulk density, intrinsic

permeability, soil disconnectedness index, soil porosity, organic carbon content, and cation exchange capacity. Site-specific data were used from geotechnical samples collected at the AOC during the PBA08 RI (Appendix Table D-11). There is, however, no measurement method for the soil disconnectedness index or a measured value of the Freundlich exponent. Soil disconnectedness index is a parameter that relates the soil permeability to the moisture content. Thus, SESOIL default values were used for these two parameters.

An average intrinsic permeability for the vadose zone representing the unconsolidated zone above the water table was calibrated using the percolation rate of 9.42 cm/year (3.6 inches/year) as the calibration target. The model was calibrated against the percolation rate by varying the intrinsic permeability and by keeping all other AOC-specific geotechnical parameters fixed. The final hydrogeologic parameter values used in this modeling are shown in Table 6-2. The soil porosity was set to the AOC-specific value. The intrinsic permeability, calibrated in SESOIL to the percolation rate (determined from a water balance estimated in HELP), was found to match the AOC-specific measurements from geotechnical samples.

Soil disconnectedness index replaces the moisture retention curves (or characteristic curves) used by other unsaturated zone leaching models. SESOIL User's Guide (Hetrick and Scott 1993) defines this parameter to be the exponent relating the “wetting” and “drying” time-dependent permeability of soil to its saturated permeability. This “one variable” approach of using soil disconnectedness index in SESOIL simplifies the data estimation process and reduces computational time. In addition, this parameter was calibrated for four different soil types ranging from sandy loam to clay (Hetrick et al. 1986) and calibrated values fell within the default range specified in the SESOIL User's Guide.

Table 6-2. Unit-Specific Parameters Used in SESOIL and AT123D Modeling

Parameters	Symbol	Units	Value	Source for Value
SESOIL				
Percolation Rate (Recharge Rate)	q	m/yr	9.42E-02	0.1 * SESOIL Precipitation for Youngstown, Ohio
Horizontal Area of Aggregate	A_p	sq. cm	EU-specific	Based on average area for all ISM areas for Building F-15 and Building F-16
Intrinsic Permeability - clayey sand	p	cm^2	1.05E-10	Calibrated from SESOIL model
Disconnectedness Index	c	unitless	11	Calibrated from SESOIL model
Freundlich Equation Exponent	n	unitless	1	SESOIL default
Fraction Organic Carbon	f_{oc}	unitless	8.40E-04	Average from the PBA08 RI geotechnical samples ATASB-007-5131-SO and ATASB-007-5132-SO
Bulk Density	ρb	kg/L	1.61	
Moisture Content	w	wt %	17	
Water-filled Soil Porosity	θw	unitless	0.274	
Air-filled Soil Porosity	θa	unitless	0.134	
Porosity - total	n_T	unitless	0.408	
Vadose Zone Thickness	Vz	m	3.0	Based on average ground surface elevation and depth to water table from facility-wide groundwater map (USACE 2010a)
Leaching Zone Thickness	Lz	m	1.0 to 2.7	Based on vadose zone thickness and results for CMCOPCs in soil
AT123D				
Aquifer Thickness	h	m	6	Facility-wide assumption for the unconsolidated aquifer presented the Load Line 1 investigation (USACE 2003a)
Hydraulic Conductivity in Saturated Zone	K_S	cm/s	4.15E-04	Geometric mean from RVAAP range in MKM (2007)
Hydraulic Gradient in Saturated Zone	i	unitless	5.00E-03	Based on Facility-wide Groundwater Map (USACE 2010a)
Effective porosity	n_e	unitless	0.2	Assumed for sandstone (USEPA 1985)
Dispersivity, longitudinal	α_L	m	30	Assumed
Dispersivity, transverse	α_T	m	3	0.1 α_L
Dispersivity, vertical	α_V	m	0.3	0.01 α_L
Retardation factor	R	unitless	chemical-specific	Presented in the Table E-7 in Appendix E

6.4.2.5 Source Terms

Analytical data from surface and subsurface soil collected at the AOC were used as the source term for SESOIL modeling. All the samples at different depth intervals were compiled to provide a detailed loading option for the SESOIL model. The samples with the maximum soil concentration for each CMCOPC listed in Table 6-1 were used as source term concentrations for the SESOIL model.

6.4.2.6 Application Data

Two different layering schemes (one for arsenic and one for naphthalene) were developed for sample areas due to varying thicknesses of the loading and leaching zones based on the depth of soil sample concentration and elevation of the water table. Each model consisted of four layers of equal thicknesses. The top two layers for the arsenic model constituted the loading zone, whereas only the top layer for the naphthalene model constituted the loading zone. Layers 3 and 4 for each model served as leaching zones. The vadose zone for both models was 10 ft thick. Layer 4 served as a leaching zone in each model. Layer 4 was included just above the water table to read output results at the water table/vadose zone interface. Details of the model layers utilized in this modeling are presented in Table E-10 in Appendix E.

6.4.3 SESOIL Modeling Results

SESOIL modeling was performed for initial CMCOPCs (arsenic and naphthalene) that have the potential to reach the water table within 1,000 years based on the soil screening analysis results (Table 6-1). Table 6-3 presents the predicted peak leachate concentrations beneath the source areas relative to the sample area locations, and the corresponding time of the peak leachate concentrations. The FWCUGs, facility-wide background concentrations, and MCL/RSL values for the CMCOPCs are also shown in this table for comparison purposes. The maximum concentration of arsenic in the leachate below the source and just above the water table exceeded its screening criteria. Therefore, arsenic was selected as a final CMCOPC for AT123D modeling. Naphthalene was excluded as a final CMCOPC for further evaluation based on the results of the SESOIL modeling. Figures E-1 and E-2 in Appendix E show the leachate mass flux versus time plots generated by SESOIL. The detailed input and output files of the SESOIL modeling are provided on a CD ROM included in Attachment 1 of Appendix E.

Table 6-3. Summary of SESOIL Modeling Results

Initial CMCOPC	Maximum Soil Concentration (mg/kg)	ISM Sample Area	Maximum Depth of Contamination (ft bgs)	Depth to Groundwater (ft bgs)	Predicted $C_{leachate, max}$ Beneath the Source (mg/L)	Time Required to Reach $C_{leachate, max}$ (years)	MCL/RSL (mg/L)	FWCUG (mg/L)[a]		Facility-Wide Background Unconsolidated Groundwater (mg/L)	Final CMCOPC?[b] (Yes/No)
								National Guard Trainee	Resident Farmer Adult

RSL= Regional Screening Level
SESOIL = Seasonal Soil Compartment model
Bold = CMCOPCs exceeding MCL/RSL, FWCUGs, and facility-wide background concentration

6.4.4 AT123D Modeling in the Saturated Zone

The fate and transport processes accounted for in the AT123D model include advection, dispersion, adsorption/retardation, and decay. This model can be used as a tool for estimating the dissolved concentration of a chemical in three dimensions in the groundwater resulting from a mass release over a source area (point, line, area, or volume source). The model can handle instantaneous, as well as continuous, source loadings of CMCOPC concentrations. AT123D is frequently used by the scientific and technical community to perform quick and conservative estimates of groundwater plume movement in space and time. SESOIL and AT123D are linked in a software package (RISKPRO) so that mass loading to the groundwater predicted by SESOIL can be directly transferred to AT123D. Therefore, AT123D was chosen to predict the maximum concentration of contaminants in groundwater after mixing with the leachate and the future concentrations for the contaminants in groundwater at the receptor locations.

The hydrogeologic parameter values used in this modeling are shown in Table 6-2. Most of the parameters presented in this table are AOC-specific values, unless otherwise indicated in the table. The chemical-specific parameters are presented in Appendix E (Tables E-1 and E-11). A discussion of model assumptions and limitations is presented in Section 6.4.6.

Arsenic was identified as a final CMCOPC based on SESOIL results where the leachate concentration exceeded its screening criteria within the AOC. Figure 6-3 presents the location of the soil sample where the final CMCOPC exists. Figure E-3 in Appendix E shows the predicted concentration versus time curves based on AT123D for arsenic. The detailed input and output of AT123D modeling is provided on a CD ROM included in Attachment 2 of Appendix E.

6.4.5 AT123D Modeling Results

AT123D modeling was performed for the final CMCOPC (arsenic) using contaminant loading results from SESOIL. Results of AT123D modeling are shown in Table 6-4 as the predicted groundwater concentration beneath the source area and at the selected downgradient receptor location (i.e., wetland area southeast of the AOC). Groundwater monitoring wells were not installed at the AOC, so observed groundwater concentrations could not be included in Table 6-4. The distance to the downgradient receptor was based on the distance along groundwater flow direction to the closest surface water body from the ISM sample location. The downgradient distance from the source area to the wetland area southeast of the AOC was approximately 200 ft.

The maximum predicted concentration of arsenic was predicted to exceed the screening criteria beneath the source area and was modeled to the downgradient receptor (wetland area southeast of the AOC). The maximum predicted concentration of arsenic modeled at the downgradient receptor location did not exceed the screening criteria and was eliminated as a CMCOC. Based on the fate and transport evaluation, all SRCs identified in the surface soil and subsurface soil sample aggregates are eliminated as posing future impacts to groundwater.

Table 6-4. Summary of AT123D Modeling Results

Final CMCOPC	Maximum Leachate Concentration[a] (mg/L)	Maximum Groundwater Concentrations[b] (C_{MAX}) at the Source (mg/L)	Maximum Groundwater Concentrations[b] (C_{MAX}) at the Downgradient Receptor (mg/L)	Distance to Downgradient Receptor (ft)	MCL/RSL (mg/L)	FWCUG (mg/L)[c]		Facility-Wide Background Unconsolidated Groundwater (mg/L)	Final CMCOC?[d] (Yes/No)

6.4.6 Limitations/Assumptions

In general, a conservative modeling approach was used, which may overestimate the contaminant concentration in the leachate for migration from observed soil concentrations. Listed below are important assumptions used in this analysis.

- The use of K_d and R_d to describe the reaction term of the transport equation assumes that an equilibrium relationship exists between the solid- and solution-phase concentrations, and that the relationship is linear and reversible.

- Since AOC-specific data are not available, the K_d values and K_{oc} values used in this analysis for all the CMCOPCs represent literature or calculated values, and may not represent conditions at the AOC.

- The K_d for inorganic chemicals used here assumed a neutral pH of 7. The K_d for inorganic chemicals varies with pH; therefore, if AOC-specific pH measurements are greater than 7, the K_d and calculated screening parameters (such as the retardation factor) will deviate from those presented here.

- Flow and transport in the vadose zone is one-dimensional (i.e., only in the vertical direction).

- This modeling used the current soil concentrations that were collected approximately 65 years after historical operations were terminated at the AOC. Therefore it does not account for chemicals that have already leached to groundwater.

- Flow and transport are not affected by density variations.

- A realistic distribution of soil contamination is not considered. The maximum concentration value was used as the source term concentrations for SESOIL model layers, a highly conservative assumption that is expected to produce higher leachate concentrations for the CMCOPCs than the average condition. The horizontal distribution of soil contamination was assumed based on concentration levels from nearby sample locations, as opposed to taking into account the entire area.

- The water balance represents an overall average rainwater recharge, and assumes an even distribution of infiltration in the modeled area. An average water balance assumes some areas will have higher or lower recharge based on the heterogeneity of the soil and varying topography.

The inherent uncertainties associated with using these assumptions must be recognized. K_d values are highly sensitive to changes in the major chemistry of the solution phase. Therefore, it is important that the values be measured or estimated under conditions that will represent as closely as possible those of the contaminant plume. Deviations from actual AOC-specific parameter values from assumed literature values may significantly affect contaminant fate predictions. It is also important to

note that the contaminant plume will change over time, and will be affected by multiple solutes that are present at the AOC. The effects of heterogeneity, and anisotropy are not addressed in these simulations.

The discrepancy between the contaminant concentrations measured in the field and the values predicted by the model could be investigated by performing sensitivity analyses on the model input parameters that have the most influence on the model predictions. These parameters are: (1) biodegradation rate constants for organic chemicals; (2) saturated hydraulic conductivity; (3) soil porosity; (4) fraction of soil organic carbon-content (f_{oc}) for organic chemicals; (5) K_d for inorganic chemicals; and (6) longitudinal, transverse, and vertical dispersivity values. Generally, higher biodegradation rates will produce lower concentrations, and lower rates will produce higher concentrations for organic chemicals without impacting the results of the inorganic chemicals. Higher hydraulic conductivity and dispersivity causes higher advection and dispersion, thereby producing lower peaks near the source area but increasing the migration distance. The reverse will be true with lower hydraulic conductivity and dispersivity values. Higher f_{oc} values have a similar effect on organic chemicals as higher K_d has on inorganic chemicals. They decrease the mobility of the chemicals as well as produce lower concentrations in groundwater.

6.5 SUMMARY AND CONCLUSIONS

Based on the results of the PBA08 RI sampling activities, inorganic SRCs and organic SRCs exist in surface soil and subsurface soil at the AOC. These SRCs were further evaluated to determine if residual concentrations in soil are protective of groundwater.

Conclusions of the soil screening, leachate modeling, and groundwater modeling are as follows:

- Arsenic and naphthalene were identified as initial CMCOPCs based on soil screening and travel time analyses (Table 6-1).

- Arsenic was identified as a final CMCOPC from the contaminant fate and transport modeling. Based on the results of the SESOIL modeling (Table 6-3), the maximum concentration of arsenic in leachate directly below the source and above the water table was above the respective screening criteria. Therefore, AT123D modeling was required to predict the maximum concentration of arsenic in groundwater after mixing with the leachate.

- The predicted maximum concentration of arsenic in groundwater was predicted to exceed the screening criteria beneath the source area, but did not exceed the screening criteria at the downgradient receptor location (i.e., wetland area southeast of the AOC).

Based on the soil screening analyses and fate and transport modeling, all SRCs found in the surface and subsurface soil samples and evaluated through the stepwise fate and transport screening evaluation presented here are eliminated as posing future impacts to groundwater.

7.0 RISK ASSESSMENT

7.1 DATA EVALUATION FOR HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENTS

The purpose of the data evaluation is to develop a set of chemical data suitable for use in the HHRA and ERA. Anchor Test Area data were evaluated to establish data aggregates and identify a list of SRCs.

Section 5.1 provides a summary of available data. Soil data collected at Anchor Test Area were grouped (aggregated) by depth interval (e.g., surface soil), EU, and sample type (i.e., discrete or ISM). Samples included in the risk assessment data sets for surface soil, deep surface soil, and subsurface soil are listed in Tables 7-1 through 7-3. There are no ditches or permanent surface water features on the AOC; therefore, no sediment or surface water samples were collected. The area immediately surrounding Anchor Test Area is forested, except for a clearing approximately 500 ft south of the AOC that is occupied by a large wetland. Drainage associated with rainfall and snow melt follows surface topography flowing in all directions from the high ground. Anchor Test Area is located on the south side of a topographic high; however, the land within and immediately surrounding the AOC has only small topographic relief. Thus, much of the precipitation landing on this area is expected to infiltrate the soil rather than run off. The high percentage of vegetative ground cover at the AOC increases infiltration and decreases erosion. A description of the soil data aggregates for which human and ecological receptors are potentially exposed is provided in Section 7.1.1, followed by a summary of SRCs in Section 7.1.2.

7.1.1 Data Aggregates

Anchor Test Area is approximately 0.5 acres and includes several dirt mounds and a nearby sand pit. The AOC is evaluated as a single EU. Evaluation as a single EU is appropriate for the potential current and future exposures at this AOC (e.g., National Guard Training, see Section 7.2.3) because a trainee could potentially move across the entire area during training. Since different future receptors are assumed to be exposed to soil at different depths, soil data within the Anchor Test Area EU were aggregated by the following depth intervals:

- Surface soil is defined as 0-1 ft bgs (shallow surface soil) for the Resident Farmer (Adult and Child) receptor. This depth interval is also most appropriate for evaluating potential risk to ecological receptors because that layer is the most active biological zone (USACE 2003c). For this risk assessment, shallow surface soil ISM samples collected in 2004 for the Characterization of 14 AOCs and in 2010 for the PBA08 RI were used to characterize surface soil.

- Deep surface soil is defined as 0-4 ft bgs for the National Guard Trainee. The upper portion (0-1 ft bgs) of this interval was characterized using ISM sampling, and the deeper portion (1-4 ft bgs) of this interval was characterized using discrete samples from soil borings. Due to different levels of variability in these two data types, these two intervals were evaluated separately.

- Subsurface soil is defined as 1-13 ft bgs for the Resident Farmer and 4-7 ft bgs for the National Guard Trainee. Discrete soil data from samples collected in February 2010 with a starting depth within these intervals were used to evaluate subsurface soil for these scenarios. Subsurface soil is not appropriate for evaluating potential risk to most ecological receptors (USACE 2003c).

Samples included in the risk assessment data sets for soil are listed in Tables 7-1 (surface soil), 7-2 (deep surface soil), and 7-3 (subsurface soil).

Table 7-1. Risk Assessment Data Set for Surface Soil (0-1 ft bgs) ISM Samples

[a]Subsurface soil is defined as 4-7 ft bgs for National Guard Trainee
[b]Subsurface soil is defined as 1-13 ft bgs for Resident Farmer
bgs = below ground surface

During previous investigations at Anchor Test Area, subsurface soil samples were collected at 1-3 ft bgs and 3-5 ft bgs. These samples were used for nature and extent evaluation only, because they are spatial composite samples collected using a methodology different from what was used to collect subsequent discrete subsurface samples. For more information on these samples see Section 5.1.4. A summary of previous investigative activities performed at Anchor Test Area is provided in Section 2.2.2.

7.1.2 Identification of SRCs

Section 5.1 presented the statistical methods and screening criteria used to identify SRCs present at concentrations that indicate potential impacts related to historical operations within the AOC. The purpose of the SRC identification is to determine the presence or absence of contamination that is site-related and is above naturally-occurring levels. The SRC screen followed the steps outlined in the in Figure 5-1 (Figure 1-2 in the FWCUG Report) and is summarized as follows:

- Background screening: The MDC of naturally-occurring inorganic chemicals were compared to the facility-wide background concentrations for RVAAP, originally published in the *Phase II Remedial Investigation Report for Winklepeck Burning Grounds* (USACE 2001b) and summarized in the FWCUG Report. Inorganic chemicals in each medium with MDCs above background screening values (BSVs) or having no BSVs were retained as SRCs.

- Screening of essential human nutrients: Chemicals considered essential nutrients (e.g., calcium, chloride, iodine, iron, magnesium, potassium, phosphorous, and sodium) are an integral part of the human food supply and are often added to foods as supplements. USEPA recommends these chemicals not be evaluated so long as they are: (1) present at low concentrations (i.e., only slightly elevated above naturally occurring levels); and (2) toxic at only very high doses (i.e., much higher than those that could be associated with contact at the AOC) (USEPA 1989). Essential nutrients detected near or below their RDA/RDI-based screening levels were eliminated as SRCs.

- Frequency of detection screening: The FWCUG Report allows for screening based on frequency of detection, where analytes detected in less than 5% of the samples can be screened out from further consideration except for explosives and propellants. However, for this AOC, no frequency-of-detection screening was performed because fewer than 20 discrete samples were available. The frequency of detection screening was not applied to ISM samples.

Details of the SRC screening for each exposure medium are provided in Tables G-1 (surface soil, 0-1 ft bgs), G-2 (deep surface soil, 1-4 ft bgs), G-3 (subsurface soil, 4-7 ft bgs), and G-4 (subsurface soil, 1-13 ft bgs). The SRCs identified for Anchor Test Area are summarized in Table 7-4 below.

Table 7-4. Summary of SRCs

SRC	Surface Soil[a] (0-1 ft bgs)	Deep Surface Soil[b] (1-4 ft bgs)	Subsurface Soil[b] (4-7 ft bgs)	Subsurface Soil[b] (1-13 ft bgs)
Arsenic	X	--	--	--

7.2 HUMAN HEALTH RISK ASSESSMENT

The HHRA presents COCs that may pose potential health risks to humans from exposure to contamination at Anchor Test Area. The HHRA was conducted as part of the PBA08 RI and is based on the methods from the FWCUG Report.

Recently, the RVAAP project team (i.e., Ohio EPA and USACE Louisville District) proposed an approach for efficient risk-based decision making at RVAAP that incorporates past experience gained through previously completed work. To accomplish this goal of streamlined risk-based decision making, the FWCUG Report was developed to support the environmental remediation of the remaining AOCs at RVAAP to complete final transfer of the land to OHARNG. The FWCUG Report contains calculated FWCUGs and guidance for their application to accelerate the decision-making process for the remaining AOCs, taking advantage of the many risk assessment inputs and decisions for the facility that have been agreed to by stakeholders through the application of the CERCLA process over the past 10 years. Most of the agreed-to risk assessment methods have been documented in the FWHHRAM and follow standard USEPA-approved risk assessment guidance. This includes the Process to Identify RVAAP Chemicals of Potential Concern (presented in Figure 5-1), the use of the TR of 1E-06 and HQ of 0.1 to identify COPCs, and the use of the TR of 1E-05 and HQ of 1.0 to identify COCs

The approach to risk-based decision-making is as follows (USACE 2010a):

1. Using the risk assessment process presented in the FWHHRAM (and included in the Final White Paper provided in Appendix A of the FWCUG Report), develop FWCUGs for all COPCs identified from the facility wide data set at RVAAP.

2. Perform RI characterization sampling and analysis to establish the baseline chemical concentrations within an AOC.

3. Perform data analysis and mapping to identify SRCs and COPCs using the process presented in Figure 5-1 (Figure 1-2 in the FWCUG Report), determine EUs, and calculate exposure point concentrations (EPCs) for each COPC following the requirements for performing these tasks as spelled out in the FWHHRAM and further clarified in the position paper developed by USACE provided in Appendix B of the FWCUG Report (USACE 2010a).

4. Compare EPCs to the FWCUGs to determine COCs.

5. Perform the FS, PP, and ROD to address any identified COCs.

Step 1 of this process (develop FWCUGs) has been completed in the FWCUG Report. The results of Step 2 (RI characterization sampling) and Step 3 (mapping and data analysis to identify SRCs) are presented in Sections 4.0 and 5.0 of this report and are summarized in Section 7.1.

The remainder of Step 3 (identification of COPCs) and Step 4 (determine COCs) are provided in the following subsections and follow the four steps for a streamlined risk assessment (also shown in Figure 1-3): identify media of concern (Section 7.2.1); identify COPCs (Section 7.2.2); determine AOC land use and appropriate receptors (Section 7.2.3); and compare to appropriate FWCUGs to identify COCs (Section 7.2.4).

7.2.1 Identify Media of Concern

Media of concern at Anchor Test Area are surface and subsurface soil, as defined in Section 7.1.1. Surface water and sediment were not evaluated because they are not present at this AOC. Groundwater is present at this AOC and will be evaluated (including risk assessment) in a separate document, as described in Section 1.2.

7.2.2 Identify COPCs

Section 5.1 presents the statistical methods and screening criteria used to identify SRCs. COPCs were identified here as a subset of the SRCs, identified in Section 5.0 and summarized in Section 7.1.2, in each exposure medium present at concentrations that indicate potential impacts to human receptors. The COPC screen follows the approach specified in the FWCUG Report and is summarized here.

For the determination of COPCs, the MDC of all SRCs was screened against the chemical-specific FWCUGs at a target cancer risk level of 1E-06 and non-carcinogenic target HQ of 0.1 for the Resident Farmer Adult, Resident Farmer Child, and the National Guard Trainee. If no FWCUGs existed for an SRC, the USEPA residential RSL (from RSL table dated May 2010) was used for this screen. Hexavalent chromium was detected in 1 of 3 speciation samples at Anchor Test Area; therefore, as part of the conservative screening approach for identifying COPCs, the FWCUG for hexavalent chromium (the more toxic of the 2 chromium species evaluated) was used at this stage.

Details of the COPC screening for each exposure medium are provided in Appendix G, Tables G-1 (surface soil, 0-1 ft bgs), G-2 (deep surface soil, 1-4 ft bgs), G-3 (subsurface soil, 4-7 ft bgs) and G-4 (subsurface soil, 1-13 ft bgs). These tables include all carcinogenic and non-carcinogenic risk-based FWCUG or RSL values for each chemical. SRCs were identified as COPCs if the detected concentrations exceed the most protective (i.e., lowest) FWCUG. The COPCs identified for the media of concern at Anchor Test Area are presented in Table 7-5 and summarized below.

7.2.2.1 COPCs in Surface Soil

Surface soil is defined as 0-1 ft bgs (shallow surface soil) for the Resident Farmer (Adult and Child) receptor (USACE 2010a). For this risk assessment, shallow surface soil ISM samples collected in 2004 and 2010 were used to characterize surface soil. Deep surface soil is defined as 0-4 ft bgs for the National Guard Trainee. Because the upper (0-1 ft bgs) portion of this interval was characterized using ISM sampling and the deeper (1-4 ft bgs) portion of this interval was characterized using discrete samples from soil borings, these two intervals were evaluated separately.

Twenty-six chemicals were detected in shallow surface soil (0-1 ft bgs) ISM samples; 14 of these chemicals (10 inorganic chemicals and 4 SVOCs) were identified as SRCs. Risk-based screening identified four inorganic chemicals (arsenic, chromium, cobalt, and manganese) as COPCs in shallow surface soil.

Twenty-four chemicals were detected in deep surface soil (1-4 ft bgs) discrete samples; three of these chemicals (2 inorganic chemicals and 1 VOC) were identified as SRCs. Risk-based screening identified no COPCs in deep surface soil.

At Anchor Test Area, chromium was identified as an SRC in shallow surface soil but not deep surface soil. The MDC of total chromium in shallow surface soil was 42.3 mg/kg, which is greater than the lowest screening value for hexavalent chromium (1.64 mg/kg) and greater than the total chromium background concentrations for shallow and deep surface soil (17.4 mg/kg and 27.2 mg/kg, respectively). Therefore, total chromium was retained as a COPC for shallow surface soil. The MDC of total chromium in deep surface soil of 22.2 mg/kg was less than the total chromium background concentration for this soil interval (27.2 mg/kg); therefore, total chromium was not retained as a COPC for deep surface soil.

7.2.2.2 COPCs in Subsurface Soil

Subsurface soil is defined as 4-7 ft bgs for the National Guard Trainee and 1-13 ft bgs for the Resident Farmer. Twenty-six chemicals were detected in discrete subsurface soil samples. Five of these chemicals (2 inorganic chemicals, 1 SVOC, and 2 VOCs) were identified as SRCs. However, risk-based screening identified no COPCs in either of these subsurface soil intervals.

Table 7-5. Summary of COPCs

SRC	Surface Soil[a] (0-1 ft bgs)	Deep Surface Soil[b] (1-4 ft bgs)	Subsurface Soil[b] (4-7 ft bgs)	Subsurface Soil[b] (1-13 ft bgs)
Arsenic	X	--	--	--
Chromium	X	--	--	--
Cobalt	X	--	--	--
Manganese	X	--	--	--

[a]Surface soil characterized using ISM sampling
[b]Deep surface and subsurface soil characterized using discrete sampling
X = Chemical is an COPC in this medium
-- = Chemical not identified as a COPC in this medium
bgs = below ground surface
COPC = Chemical of Potential Concern
ISM = Incremental Sampling Method
SRC = Site-related Contaminant

7.2.3 Determine AOC Land Use and Appropriate Receptors

Anchor Test Area is located in the south central portion of RVAAP west of Wilcox-Wayland Road, south of Newton Falls Road, and north of South Service Road. Although operational information about Anchor Test Area is relatively limited, the AOC was used for research, development, and the

testing of explosively-driven soil anchoring devices. The dates of use for Anchor Test Area are unknown, although it is believed testing activities did not occur until after 1961.

Anchor Test Area encompasses approximately 0.5 acres and includes several dirt mounds with a nearby sand pit (approximately 12 ft by 36 ft). There is metal debris in the area. The non-operational areas of Anchor Test Area are heavily forested, and the former operational areas of the AOC are covered with trees, rough grasses, and scrub vegetation. The area immediately surrounding Anchor Test Area is forested except for a clearing approximately 500 ft south of the AOC that is occupied by a large wetland area. The land within and immediately surrounding the AOC has little topographic relief. Thus, much of the precipitation landing on this area is expected to infiltrate the soil rather than run off. The high percentage of vegetative ground cover at the AOC will further help increase infiltration and decrease erosion.

RVAAP is a controlled access facility that is fenced and patrolled by security personnel. Anchor Test Area, located in the south-central portion of RVAAP, is currently inactive. Full-time OHARNG, BRAC, and contractor staff work at the facility. Military training and operations are conducted at the facility. The OHARNG projected future land-use for the AOC is Military Use and Training. The representative receptor is the National Guard Trainee and per the FWHHRAM this constitutes the Risk Assessment Land Use of Dismounted Training-Digging. National Guard Training, in conjunction with the evaluation of agricultural-residential land uses and associated receptors, form the basis for identifying COCs. Residential Land Use, specifically the Resident Farmer scenario, is included to evaluate COCs for unrestricted land use at the AOC as required by the CERCLA process and as outlined in the FWHHRAM (USACE 2005a).

7.2.4 Compare to Appropriate FWCUGs

Previous sections have outlined the process for identifying SRCs (Section 7.1.2) and COPCs (Section 7.2.2). The comparison to FWCUGs and determination of COCs follows guidance presented in Appendix B of the FWCUG Report. The screening process is as follows:

- Select the FWCUGs corresponding to a TR of 1E-05 and target HQ of 1.0 for: (1) the planned National Guard end-use (i.e., National Guard Trainee); and (2) the Resident Farmer Adult and Child receptors to evaluate an unrestricted land use scenario.

- Report all carcinogenic and non-carcinogenic based FWCUGs for each COPC for all appropriate receptors (i.e., National Guard Trainee and Resident Farmer Adult and Child).

- Report critical effect and target organ for each of the non-carcinogenic based FWCUGs.

- Complete a comparison of the selected FWCUG to the EPC, including a sum-of-ratios (SOR). The SOR is used to account for the potential additive effects from exposure to multiple chemicals that can cause the same effect (e.g., cancer) or affect the same target organ. Cancer risk is assumed to be additive for all carcinogens. Non-cancer risk is assumed to be additive for chemicals with similar sites of toxicological action (i.e., target organ such as liver or critical

effect such as adversely effecting the ability to reproduce). This approach compares the EPC of each COPC to the FWCUG to determine a ratio. The sum of these individual ratios is then compared to 1. The SOR method is based on the principle that a ratio greater than 1 represents unacceptable cumulative exposure (i.e., above FWCUGs if adjusted for exposure to multiple COPCs), and a ratio less than or equal to 1 represents acceptable cumulative exposure (i.e., below FWCUGs if adjusted for exposure to multiple COPCs).

  - For non-carcinogens, compare the EPC to the target HQ FWCUG. Sum the ratios of EPC/FWCUG for COPCs that affect similar target organs.
  - For carcinogens, compare the EPC to the TR FWCUG. Sum the ratios of EPC/FWCUG for all carcinogens.

- The COPC is identified as a COC for a given receptor:
  - If the EPC exceeds the more protective FWCUG for either the 1E-05 target cancer risk or the 1.0 target HQ; or
  - If the SOR for all carcinogens or all non-carcinogens that may affect the same organ is greater than 1, chemicals contributing at least 10% to the SOR are also considered COCs.

The process for calculating FWCUGs is a rearrangement of the cancer risk or non-cancer hazard equations, with the goal of obtaining the concentration that will produce a specific risk or hazard level. For example, the FWCUG for arsenic at the cancer risk level of 1E-05 for the National Guard Trainee is the concentration of arsenic that produces a risk of 1E-05 when using the exposure parameters specific to the National Guard Trainee receptor. Exposure parameters used to calculate FWCUGs for the receptors evaluated for Anchor Test Area are presented in Appendix G, Table G-5.

For carcinogens, risk is expressed as the probability that an individual will develop cancer over a lifetime as a result of exposure to the carcinogen. Cancer risk from exposure to contamination is expressed as the increased chance of cancer above the normal background rate of cancer. In the United States, the background chance of contracting cancer is a little more than 3 in 10, or 3E-01 (American Cancer Society 2003). The calculated incremental lifetime cancer risks (ILCRs) are compared to the range specified in the NCP of 10-6 to 10-4, or 1 in one million to 1 in 10,000 exposed persons developing cancer (USEPA 1990). Cancer risks below 10-6 are considered acceptable; cancer risks above 10-4 are considered unacceptable. The range between 10-6 and 10-4 is of concern, and any decisions to address risks further in this range, either through additional study or engineered control measures, should account for the uncertainty in the risk estimates. The Ohio EPA Division of Environmental Response and Revitalization (DERR) Remedial Response program has adopted a human health cumulative ILCR goal within this range of 1E-5 to be used as the level of acceptable excess cancer risk and for the development of remediation goals for a site. The DERR notes the defined risk goal should be applied as a goal, recognizing the need to retain flexibility during the evaluation and selection of remedial alternatives.

In addition to developing cancer from exposure to chemicals, an individual may experience other toxic effects. The term “toxic effects” is used here to describe a wide variety of systemic effects ranging from minor irritations, such as eye irritation and headaches, to more substantial effects, such

as kidney or liver disease and neurological damage. The risks associated with toxic (i.e., non-carcinogenic) chemicals are evaluated by comparing an estimated exposure (i.e., intake or dose) from AOC media to an acceptable exposure expressed as a reference dose (RfD). The RfD is the threshold level below which no toxic effects are expected to occur in a population, including sensitive subpopulations. The ratio of intake over the RfD is the HQ (USEPA 1989).

The SOR is used to account for the potential additive effects from exposure to multiple chemicals that can cause the same effect (e.g., cancer) or affect the same target organ. Cancer risk is assumed to be additive for all carcinogens. Non-cancer risk is assumed to be additive for chemicals with similar sites of toxicological action (i.e., target organ such as the liver or critical effect such as adversely effecting the ability to reproduce). This approach compares the EPC of each COPC to the FWCUG to determine a ratio. The sum of these individual ratios is then compared to 1. The SOR method is based on the principle that a ratio greater than 1 represents unacceptable cumulative exposure (i.e., above FWCUGs if adjusted for exposure to multiple COPCs), and a ratio less than or equal to 1 represents acceptable cumulative exposure (i.e., below FWCUGs if adjusted for exposure to multiple COPCs). The FWCUGs for some chemical/receptor combinations are less than the background concentration. In these instances the chemical concentrations are compared to background concentrations for identification of COCs. Since the background concentration is not risk-based, these chemicals are not included in the SOR calculations.

The COCs identified by the comparison of EPCs to FWCUGs are further evaluated in an uncertainty analysis to identify COCs requiring evaluation in the FS.

The selection of FWCUGs, calculation of EPCs for comparison to the FWCUGs, and the resulting risk-based COCs are detailed in the following sections for Anchor Test Area.

7.2.4.1 Selection of Appropriate FWCUGs

The RAFLU for Anchor Test Area is National Guard Training with Digging. The representative receptor for selecting FWCUGs for the Anchor Test Area evaluation is the National Guard Trainee. In addition to this planned OHARNG land use, the Resident Farmer Adult and Child FWCUGs are used to evaluate an unrestricted land use scenario.

FWCUGs for these receptors from the FWCUG Report (USACE 2010a) are provided in Table 7-6 for all COPCs. The critical effect or target organ associated with the toxicity values used to calculate the FWCUGs are also provided in this table.

Table 7-6. FWCUGs Corresponding to an HQ of 1.0 and Target Risk of 1E-05 in Soil

COPC	Critical Effect or Target Organ	FWCUG (mg/kg)			
		National Guard Trainee		Resident Farmer[a]	
		HQ = 1.0	TR = 1E-05	HQ = 1.0	TR = 1E-05
Arsenic	Skin	1140	27.8[c]	20.2	4.25[d]
Chromium, hexavalent[b]	Stomach, liver/kidney	56.1	16.4	199	1874
Chromium, trivalent	NOAEL	1,000,000	--	81,473	--
Cobalt	NS	140	70.3	1313	8030
Manganese	CNS	351[cd]	--	2927	--

[a]Resident Farmer FWCUGs are the smaller of the Adult or Child values for each COPC and endpoint (non-cancer and cancer)
[b]FWCUG for hexavalent chromium was calculated using a cancer URF developed for a chromate mixture consisting of 1/7 hexavalent chromium and 6/7 trivalent chromium
[c]FWCUGs are less than precedent CUG values for the National Guard Trainee for arsenic (31 mg/kg) and manganese (1800 mg/kg) published in the *Interim Record of Decision for the Remediation of Soils at Load Lines 1 through 4* (USACE 2007a), the *Record of Decision for Soil and Dry Sediment for RVAAP-12 Load Line 12* (USACE 2009b), and/or the *Final Record of Decision for Soil and Dry Sediment at the Fuze and Booster Quarry Landfill/Ponds (RVAAP-16)* (USACE 2007b) as documented in Table 5-12 of the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a).
[d]FWCUGs are less than the background screening values for arsenic in surface soil (15.4 mg/kg) and subsurface soil (19.8 mg/kg) and for manganese in surface soil (1450 mg/kg) and subsurface soil (3030 mg/kg).
CNS = Central Nervous System
COPC = Chemical of Potential Concern
CUG = Cleanup Goal
FWCUG = Facility-Wide Cleanup Goal
HQ = Hazard Quotient
NOAEL = No Observable Adverse Effect Level
NS = Not specified
TR = Target Risk
-- = No value available

FWCUGs are available for both hexavalent chromium and trivalent chromium. Existing historical data at other AOCs indicates chromium exists predominantly in the trivalent state, rather than the more toxic hexavalent state. To determine whether the FWCUG for trivalent or hexavalent chromium is most applicable to Anchor Test Area and to support risk management decisions, three discrete surface soil samples were collected and analyzed for hexavalent chromium and total chromium per the PBA08 SAP, as described in Sections 4.1.1 and 5.1.2. Two samples were collected from areas previously identified as having elevated total chromium concentrations, and one sample was collected from an area identified as having chromium concentrations near background concentrations. This process has been approved and was documented in the *Remedial Investigation Report Addendum No. 1 for the RVAAP-49 Central Burn Pits* (USACE 2008). Identification of the appropriate FWCUGs for evaluating chromium results is based on evaluation of the following lines of evidence:

- **Calculation of the percent hexavalent chromium in chromium speciation samples.** The FWCUG for hexavalent chromium is based on a cancer unit risk factor (URF) calculated using a chromium mixture assumed to contain 14% hexavalent chromium and 86% trivalent chromium. (USEPA 1998). No hexavalent chromium was detected in two of the three chromium speciation samples collected at Anchor Test Area. Hexavalent chromium was detected in the third speciation sample at 1.1 mg/kg, which is 5.3% of the total chromium measured in this sample.

These results are below the 14% hexavalent chromium used as the basis for the cancer URF, which was used to calculate the hexavalent chromium FWCUGs.

- **Comparison of the concentration of hexavalent chromium detected in the chromium speciation samples to a FWCUG adjusted to represent only hexavalent chromium.** The most protective FWCUG for hexavalent chromium is for the National Guard Trainee (16.4 mg/kg) and is calculated from a cancer URF based on a chromium mixture containing one-seventh (14%) hexavalent chromium (USEPA 2010b). Since the study used as the basis for the cancer URF included workers exposed to both trivalent and hexavalent chromium, the FWCUG must be adjusted to represent only hexavalent chromium for comparison to hexavalent chromium results in the speciation samples. The toxicological review of hexavalent chromium written in support of summary information on the USEPA's Integrated Risk Information System (IRIS) states that the risk of hexavalent chromium is estimated on the basis of the total chromium obtained from all the soluble and insoluble chromium to which workers were exposed. Since there are likely differences between the chromium compounds to which workers were exposed, the potency of hexavalent chromium compounds may be underestimated. However, since the maximum ratio of trivalent chromium to hexavalent chromium reported in the worker studies is 6, the underestimation of the risk for hexavalent chromium is unlikely to be greater than sevenfold (USEPA 1998). Therefore, one-seventh of the National Guard Trainee FWCUG (16.4/7=2.3mg/kg) is appropriate for evaluation of hexavalent chromium alone. The single detected concentration of hexavalent chromium in the chromium speciation samples (1.1 mg/kg) is less than 2.3 mg/kg, indicating hexavalent chromium is not present above the hexavalent chromium FWCUG.

- **Comparison of the concentration of total chromium to the FWCUG for trivalent chromium.** Hexavalent chromium is present at a very low concentration (i.e., below the FWCUG for hexavalent chromium alone), and the percent hexavalent chromium is less than 14%. Therefore, hexavalent chromium is not of concern at Anchor Test Area, and the reported concentrations of total chromium were compared to the FWCUGs for trivalent chromium for identifying COCs at this AOC.

Hexavalent chromium was not detected in two of the three chromium speciation samples and was detected in the third sample at less than 14% of total chromium. The concentration of hexavalent chromium was also lower than the most conservative FWCUG adjusted to represent only hexavalent chromium. Therefore, hexavalent chromium is not of concern at Anchor Test Area, and the FWCUG for trivalent chromium is appropriate for the identification of COCs.

7.2.4.2 Exposure Point Concentrations for Comparison to FWCUGs

EPCs are intended to provide representative concentrations that a receptor might contact during the period of exposure. For shallow surface soil (0-1 ft bgs), the EPC was the detected concentration in each ISM sample collected at Anchor Test Area. No COPCs were identified in deep surface (1-4 ft bgs) or subsurface soil (4-7 and 1-13 ft bgs); therefore, these depths are not evaluated further.

7.2.4.3 Identification of COCs: National Guard Trainee

COC screening for the shallow surface soil interval (0-1 ft bgs) for the National Guard Trainee receptor is detailed in Appendix G, Tables G-6 (screening against receptor-specific FWCUGs) and G-7 (SOR for carcinogens). No COPCs and, therefore, no COCs were identified for the deep surface (1-4 ft bgs) or subsurface (4-7 ft bgs) soil intervals. Surface soil COCs for the National Guard Trainee are summarized below, and in Table 7-7.

Arsenic was identified as a COC for the National Guard Trainee in shallow surface soil (0-1 ft bgs) at ISM sample location ATAss-005M. The detected EPC in this sample is 54 mg/kg which is greater than the FWCUG of 27.8 mg/kg. The FWCUG Report presents chemicals for which a ROD has been published at the RVAAP, resulting in a precedent CUG that reflects risk management considerations. The precedent CUG for arsenic in surface soil for the National Guard Trainee is 31 mg/kg, as documented in the *Interim Record of Decision for the Remediation of Soils at Load Lines 1 through 4* (USACE 2007a) and the *Record of Decision for Soil and Dry Sediment for RVAAP-12 Load Line 12* (USACE 2009b) and summarized in Table 5-12 of the FWCUG Report. Arsenic was not identified as an SRC in the deeper surface soil interval (1-4 ft bgs) or in the subsurface soil interval (4-7 ft bgs) because all measured concentrations were less than background concentrations.

The reported concentration of manganese (1,500mg/kg) at ISM sample location ATAss-001M exceeds the FWCUG of 351mg/k and the facility-wide surface soil BSV of 1,450mg/kg. The FWCUG Report presents chemicals for which a final ROD has been published at the RVAAP, including manganese, resulting in a precedent CUG that reflects risk management considerations. The precedent CUG for manganese in surface soil is 1,800 mg/kg as documented in the *Interim Record of Decision for the Remediation of Soils at Load Lines 1 through 4* (USACE 2007a) and the *Record of Decision for Soil and Dry Sediment at the Fuze and Booster Quarry Landfill/ Ponds* (USACE 2007b). The detected concentration at sample location ATAss-001M (1,500 mg/kg) is less than the precedent CUG of 1,800 mg/kg; therefore, manganese is not a COC in shallow surface soil.

Chromium was not identified as a COC in surface soil. Using the lines of evidence presented in Section 7.2.4.1, FWCUGs for trivalent chromium were identified as being appropriate for use at Anchor Test Area. The MDC of total chromium in surface soil (42.3 mg/kg) is much less than the National Guard Trainee FWCUG for trivalent chromium (1,000,000 mg/kg). Chromium was not identified as an SRC in the deeper surface soil interval (1-4 ft bgs) because the MDC of total chromium in deep surface soil (22.2 mg/kg) and subsurface soil (16.6 mg/kg) are less than the subsurface background concentration for total chromium of 27.2 mg/kg. Based on these data, chromium is not a COC in Anchor Test Area soil.

No additional COCs were identified based on the SOR analysis as summarized below:

- None of the COPCs have the same non-cancer critical effect or target organs; therefore, an SOR for non-cancer endpoints was not calculated.

- Two COPCs (arsenic and cobalt) identified in shallow surface soil have FWCUGs for the cancer endpoint. An SOR was calculated for each ISM sample (Table G-7). Chromium was not included in the SOR because the measured total chromium concentration is best evaluated as trivalent chromium. All calculated SORs for arsenic and cobalt are $\leq$ 1; therefore, no additional COCs were identified.

The location of surface soil ISM samples having COCs is shown in Table 7-7.

Table 7-7. COC Identified for Evaluation in the FS for Surface Soil (0-1 ft bgs) ISM Samples: National Guard Trainee

Chemical	Result mg/kg	FWCUG mg/kg	Background[a] mg/kg	ISM Sample Location
Arsenic	54	27.8	15.4	ATAss-005M-SO

bgs = below ground surface
COC = Chemical of Concern
FS = Feasibility Study
FWCUG = Risk-based Facility-Wide Cleanup Goal
ISM = Incremental Sampling Method

7.2.4.4 Identification of COCs: Resident Farmer

COC screening for the shallow surface soil interval (0-1 ft bgs) for the Resident Farmer receptor is detailed in Appendix G, Table G-8. No COPCs and no COCs were identified for subsurface soil (1-13 ft bgs). Surface soil COCs for the Resident Farmer are summarized below and in Table 7-8.

Arsenic was the only COC identified for the Resident Farmer in shallow surface soil (0-1 ft bgs) at ISM location ATAss-005M. The detected EPC in this sample (54 mg/kg) was greater than both the Resident Farmer FWCUG (4.25 mg/kg) and the background concentration of 15.4 mg/kg. Arsenic was not identified as an SRC in subsurface soil (1-13 ft bgs). The location of the surface soil ISM sample with arsenic as a COC is shown in Table 7-8.

No additional COCs were identified based on the SOR analysis as summarized below:

- None of the COPCs have the same non-cancer critical effect or target organs; therefore, an SOR for non-cancer endpoints was not calculated.

- The only carcinogenic COPCs are arsenic and cobalt. The FWCUG for arsenic is less than the BSV for this metal; therefore, detected arsenic concentrations are compared to the background concentration for identification of COCs. Since the background concentration is not risk-based arsenic was not included in the SOR analysis.

Table 7-8. COC Identified for Evaluation in the FS for Surface Soil ISM Samples: Resident Farmer

Chemical	Result	FWCUG[a]	Background[b]	ISM Sample Location
Arsenic	54	4.25	15.4	ATAss-005M-SO

FS = Feasibility Study
ISM = Incremental Sampling Method

7.2.5 Uncertainty Assessment

The sources of uncertainty, as well as the potential bias they impart to the risk assessment (i.e., whether conservatism is increased or decreased), are briefly discussed below.

7.2.5.1 Uncertainty in Estimating Potential Exposure

Sources of uncertainty in estimating potential human exposure include limitations of the sampling and analysis, comparison to background concentration to identify SRCs, and estimation of EPCs.

Sampling Limitations. Uncertainties arise from limits on the media sampled, the total number and specific locations that can be sampled, and the parameters chosen for analysis to characterize the AOC. Surface soil has been characterized using ISM sampling biased toward areas anticipated to have the highest level of potential contamination. The results of surface soil sampling were used to efficiently guide selection of locations for discrete subsurface soil sampling locations with a bias toward the areas of highest potential contamination.

Analytical Limitations. Uncertainty is associated with the chemical concentrations detected and reported by the analytical laboratory. The quality of the analytical data used in the risk assessment was maximized, and uncertainty was minimized by implementing QA/QC procedures that specify how samples are selected and handled. However, sampling errors, laboratory analysis errors, and data analysis errors can occur. Beyond the potential for errors, there is normal variability in analytical results. Some current analytical methods are limited in their ability to achieve detection limits at or below risk-based screening levels. Under these circumstances, it is uncertain whether the true concentration is above or below the screening levels which are protective of human health. When analytes have a mixture of detected and non-detected concentrations, EPC calculations may be affected by these detection limits. Risks may be overestimated as a result of some sample concentrations being reported as non-detected at the method detection limit (MDL), when the actual concentration may be much smaller than the MDL. Risks may also be underestimated if some analytes that were not detected in any sample were removed from the COPC list. If the concentrations of these analytes are below the MDL, but are above the screening level, the risk from these analytes would not be included in the risk assessment results.

Identification of SRCs. Uncertainty associated with screening against background concentrations results from statistical limitations and natural variation in background concentrations. Because of this variation, inorganic chemical concentrations below the BSVs are likely representative of background conditions. Inorganic chemical concentrations above the BSV may be above the background concentration, or may reflect natural variation. This is especially true for measured concentrations close to the BSV. At Anchor Test Area, six inorganic chemicals identified as SRCs (barium, beryllium, cobalt, manganese, mercury, and nickel) had MDCs in surface soil that were less than 2 times the BSV (thallium and cadmium had no BSV for comparison). The consequences of carrying most of these inorganic chemicals forward as SRCs, even if they are actually representative of background concentrations, is negligible because they are not toxic at near background concentrations. By contrast, naturally-occurring (background) arsenic and manganese in soil exceeds risk-based CUGs. Therefore, the consequence of identifying arsenic and manganese as an SRCs if they are, in fact, representative of background can have a significant impact on the conclusions of the risk assessment. The MDC of arsenic in surface soil at Anchor Test Area was 54 mg/kg. The BSV for arsenic in surface soil at RVAAP is 15.4 mg/kg. Vosnakis and Perry (2009) recently published the results of arsenic background concentration studies that included 313 samples of Ohio soil. In these samples, naturally-occurring arsenic ranged from 1.6 mg/kg to 71.3 mg/kg with a 95^{th} percentile of 21.7mg/kg and upper tolerance limits of 22.8 mg/kg and 29.6 mg/kg for surface soil. Other studies of native soil in Ohio reported concentrations of arsenic ranging from 0.5 to 56 mg/kg (Ohio EPA 1996), and the United States Geological Survey's Certificate of Analysis of the Devonian Ohio Shale estimates arsenic concentrations of 68.5 mg/kg are naturally present in bedrock shales (USGS 2004). Although arsenic appears to be elevated at ISM location ATAss-005M, the background concentration measured by other studies indicates the arsenic levels measured at Anchor Test Area may reflect the high end of naturally occurring background concentrations, rather than contamination. Thus, retention of arsenic as a COC at the AOC has a high level of uncertainty.

Exposure Point Concentrations. Shallow surface soil was characterized using ISM sampling techniques. ISM samples provide a physical average concentration across an exposure area. Use of ISM sampling reduces the uncertainty associated with estimating a statistical average exposure. There is some evidence the use of stainless steel grinding blades in the processing of ISM samples could contribute chromium and nickel to the ISM soil samples. Representative EPCs for surface soil were measured using ISM data based on the assumption that the samples collected were random samples from an exposure area. This assumption is not true for Anchor Test Area, where sample locations were biased to identify areas of highest chemical concentrations and the FWCUGs assume all exposure occurs within these elevated sampled areas. Therefore, EPCs generated from these data are likely to represent an upper bound of potential exposure concentrations.

7.2.5.2 Uncertainty in Use of FWCUGs

Sources of uncertainty in the FWCUGs used to identify COCs include the selection of appropriate receptor and the exposure parameters, exposure models, and toxicity values used in the calculation of FWCUGs.

Selection of Representative Receptors. While future land uses were developed to steer the cleanup program at the facility (as summarized in the FWHHRAM), and it is known the OHARNG will control and use the property for military training, there is still some uncertainty in the specific details of the future land use. There is little to no uncertainty associated with the assumption that RVAAP will not be released for residential use; however, a Resident Farmer receptor is included to provide an unrestricted evaluation.

Exposure Parameters and Exposure Models. For each primary exposure pathway included in the FWCUGs, assumptions are made concerning the exposure parameters (e.g., amount of contaminated media a receptor can be exposed to and intake rates for different routes of exposure) and the routes of exposure. Most exposure parameters have been selected so that errors occur on the side of human health protection. When several of these upper-bound values are combined in estimating exposure for any one pathway, the resulting risks can be in excess of the 99th percentile and, therefore, outside of the range that may be reasonably expected. Therefore, the consistent selection of upper-bound parameters generally leads to overestimation of the potential risks.

Highly protective exposure parameters used in the FWCUGs for the National Guard Trainee include the assumptions that: (1) a trainee will return to the same AOC for all training over a 25 year enlistment period; (2) the trainee breathing rate is 44 m^3/day (versus a normal breathing rate of 20 m^3/day); and (3) trainees are exposed to airborne chemicals as a result of very high dust loading associated with potential dust generation during use of heavy equipment (e.g., tanks) driven on hard dry ground 24 hours/day for their entire training period. The last two assumptions strongly impact the FWCUGs for chemicals that are primarily toxic via the inhalation pathway. For example, in reality, for a portion of the year, there is no dust loading due to precipitation (i.e., during much of the training time there is mud present). The National Oceanic and Atmospheric Administration lists the mean precipitation days with precipitation >1 mm for the Cleveland area as 115 days/year.

Toxicity Values. The toxicity of chemicals is under constant study and values change from time to time. The toxicity values used in the calculation of the FWCUGs were the most recent values available at the time of those calculations (September 2008). These values are designed to be conservative and provide an upper-bound estimate of risk.

The toxicity and mobility of many inorganic chemicals in the environment is dependent on the chemical species present. Two important examples are arsenic and chromium. Inorganic arsenic, arsenite (As+3) and arsenate (As+5), are the most toxic arsenic species, with As+3 being more toxic than As+5. Methylated arsenic, such as monomethylarsonic acid and dimethylarsinic acid, are less toxic; arsenic compounds, such as arsenocholine and arsenobetaine, are considered to be non-toxic (Pongratz 1998). The toxicity values used in developing the FWCUGs are for inorganic arsenic; however, these values do not distinguish between arsenite and arsenate.

Chromium is generally present in the environment as either the trivalent (Cr+3) or hexavalent (Cr+6) species, with the trivalent form generally being more stable and, therefore, more common. FWCUGs are available for both hexavalent chromium and trivalent chromium. Trivalent chromium has not been shown to be carcinogenic. It is an essential micronutrient but can be toxic at high doses (i.e.,

above the reference dose used to calculate the FWCUG). The FWCUG for trivalent chromium is based on non-cancer effects. Hexavalent chromium is much more toxic than trivalent chromium. It is classified as a "known human carcinogen" and may also cause non-cancer effects. The cancer URF for hexavalent chromium published in IRIS is based on epidemiological data on lung cancer in workers associated with chromate production. Workers in the chromate industry are exposed to both trivalent and hexavalent compounds of chromium. The cancer mortality in the study used to establish the URF was assumed to be due to hexavalent chromium. It was further assumed that hexavalent chromium constituted no less than one-seventh of the total chromium in air that the workers were exposed to. As noted in IRIS, the assumption that the ratio of hexavalent to trivalent chromium was 1:6 in this study may lead to a sevenfold underestimation of risk when using this URF to evaluate exposure to hexavalent chromium alone.

To avoid the underestimation of risk, selection of the FWCUG for chromium includes a step that compares the maximum concentration of hexavalent chromium detected in chromium speciation samples to a FWCUG adjusted to represent only hexavalent chromium. The lowest and most conservative FWCUG for hexavalent chromium is for the National Guard Trainee (16.4 mg/kg), and is based on a cancer URF calculated using a chromate mixture containing 14% hexavalent chromium (USEPA 2010b). Since the study used as the basis for the cancer URF included workers exposed to both trivalent and hexavalent chromium, the FWCUG must be adjusted to represent only hexavalent chromium. One-seventh, or 14%, of the National Guard Trainee FWCUG [(16.4mg/kg)/7 = 2.3 mg/kg] is appropriate for evaluation of hexavalent chromium alone. Concentrations of hexavalent chromium in chromium speciation samples that are less than or equal to 2.3 mg/kg indicate that hexavalent chromium is not present above the hexavalent chromium FWCUGs, and supports use of the trivalent chromium FWCUGs for evaluation of total chromium results.

Hexavalent chromium was not detected in two of the three chromium speciation samples collected at Anchor Test Area. In the third speciation sample, hexavalent chromium was detected at 1.1 mg/kg, which was 5.3% of total chromium measured in this sample. Since hexavalent chromium was detected in one of three speciation samples at less than 14% of total chromium, and did not exceed the most conservative FWCUG adjusted downward to represent only hexavalent chromium, the chromium speciation results show that hexavalent chromium is not of concern at Anchor Test Area; the trivalent chromium FWCUG is appropriate for the identification of COCs. The use of speciation samples to identify the appropriate FWCUG minimizes uncertainty.

7.2.5.3 Uncertainty in the Identification of COCs

The SOR is used to account for the potential additive effects from exposure to multiple chemicals that can cause the same effect or affect the same target organ. Cancer risk is assumed to be additive for all carcinogens. Non-cancer risk is assumed to be additive for chemicals with similar sites of toxicological action. In the event that any combination of COPCs results in synergistic effects, risk might be underestimated. Conversely, the assumption of additivity would overestimate risk if a combination of COPCs acted antagonistically. It is unclear whether the potential for chemical interaction has been inadvertently understated or overstated. It seems unlikely the potential for chemical interaction contributes significant uncertainty to the conclusions of the risk assessment.

Arsenic was identified as the only COC in surface soil at Anchor Test Area because the concentration at ISM sample location ATAss-005M exceeds the FWCUG and the RVAAP background concentration. An evaluation of the natural variability of arsenic in Ohio soil indicates the measured arsenic concentration in this sample may reflect the high end of natural variation. Because arsenic exceeds both the RVAAP background concentration and the FWCUG, and uncertainty associated with detected inorganic chemicals near the high end of the background concentration, arsenic was identified as a COC at this location for evaluation in the FS.

All of the sources of uncertainty described in the previous sections potentially impact the identification of COCs. The exposure and toxicity values used to calculate FWCUGs, as well as the approach for identifying SRCs, COPCs, and ultimately COCs based on the FWCUGs, were designed to ensure the over-estimation rather than under-estimation of potential risks. The uncertainty assessment attempts to put the identified COCs in perspective to facilitate informed risk management decisions for the AOC.

7.2.6 Summary of HHRA

This HHRA documents COCs that may pose potential health risks to human receptors resulting from exposure to contamination at the AOC. This HHRA was conducted as part of the RI/FS and was based on the approach described in the FWCUG Report. The components of the risk assessment (receptors, exposure media, EPCs, and results) are summarized below.

Receptors. RVAAP is a controlled-access facility and is fenced and patrolled by security personnel. Anchor Test Area is located in the south central portion of RVAAP and is currently inactive. The OHARNG projected future land-use for Anchor Test Area is Military Use and Training. The representative receptor is the National Guard Trainee, and per the FWHHRAM, this constitutes the Risk Assessment Land Use of Dismounted Training – Digging. National Guard Training, in conjunction with the evaluation of agricultural-residential land use to evaluate an unrestricted land use option, form the basis for identifying COCs. Residential Land Use, specifically the Resident Farmer, is included to evaluate COCs for unrestricted land use at the AOC as required by the CERCLA process and as outlined in the FWHHRAM.

Exposure Media. Media of concern at Anchor Test Area are surface and subsurface soil. Surface soil is defined as 0-1 ft bgs (i.e., shallow surface soil) for the Resident Farmer receptor and 0-4 ft bgs (i.e., deep surface soil) for the National Guard Trainee receptor. Because the upper (0-1 ft bgs) portion of this interval was characterized using ISM sampling and the deeper (1-4 ft bgs) portion was characterized using discrete samples from soil borings, the two intervals that make up deep surface soil for the National Guard Trainee are evaluated separately. Subsurface soil is defined as 4-7 ft bgs for the National Guard Trainee and 1-13 ft bgs for the Resident Farmer.

Estimation of EPCs. For shallow surface soil (0-1 ft bgs), the EPC is the detected concentration in each ISM sample collected at the AOC. EPCs were not used for deep surface and subsurface soil because no COPCs were identified in these intervals.

Results of Human Health Risk Assessment. Arsenic was the only COC identified in ISM surface soil (0-1 ft bgs) samples for the National Guard Trainee and Resident Farmer receptors at ISM sample location ATAss-005M. No COPCs or COCs were identified in deep surface soil (1-4 ft bgs) or either of the subsurface soil aggregates. COCs identified for each potential exposure medium and receptor are summarized in Table 7-9.

Table 7-9. Summary of COCs Identified for Evaluation in the FS

Media	Chemical of Concern	Cleanup Goal (mg/kg)
National Guard Trainee		
Shallow Surface Soil (0-1 ft bgs)	Arsenic	31[a]
Resident Farmer		
Shallow Surface Soil (0-1 ft bgs)	Arsenic	15.4[b]

[a] Cleanup goal (CUG) for arsenic in surface soil for the National Guard Trainee is the precedent CUG of 31 mg/kg from the *Interim Record of Decision for the Remediation of Soils at Load Lines 1 through 4* (USACE 2007a) and the *Record of Decision for Soil and Dry Sediment for RVAAP-12 Load Line 12* (USACE 2009b) as documented in Table 5-12 of the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a).
[b] CUG for residential land use is the facility-wide background concentration for RVAAP published in the *Phase II Remedial Investigation Report for Winklepeck Burning Grounds* (USACE 2001b) because the Facility-Wide Cleanup Goal (FWCUG) for the Resident Farmer is less than the background concentration.
bgs = below ground surface
COC = Chemical of Concern
mg/kg = milligrams per kilogram

Based on these results, the recommended path forward is to evaluate removal alternatives to address arsenic in surface soil ISM sample area ATAss-005M.

7.3 ECOLOGICAL RISK ASSESSMENT

7.3.1 Introduction

The ERA presented in this RI/FS report follows a unified approach of methods integrating U.S. Army, Ohio EPA, and USEPA guidance. This ERA approach is consistent with the general approach by these agencies and primarily follows the Level I Scoping ERA, Level II Screening ERA, and Level III Baseline ERA outlined in the *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2008), with specific application of components from the FWERWP, *Risk Assessment Handbook Volume II: Environmental Evaluation* (USACE 2010b), and *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments* (USEPA 1997). The process implemented in this RI/FS report combines these guidance documents to meet requirements of the Ohio EPA and U.S. Army, while following previously accepted methods established for RVAAP. This unified approach resulted from coordination between USACE and Ohio EPA during the summer of 2011.

7.3.1.1 Scope and Objective

Anchor Test Area contains habitat (soil) that supports ecological receptors. This terrestrial habitat has known chemical contamination (MKM 2007). Habitat types and an assessment of the ecological resources found at Anchor Test Area are presented in subsequent subsections. Additionally, the results of a historical ERA (an ERS performed as part of the Characterization of 14 AOCs) and the PBA08 RI are provided to determine whether a qualitative ERA (Level I) is sufficient, based on the quality of the habitat and the presence of contamination, or whether a more rigorous ERA (Level II or Level III) should be conducted.

7.3.2 Level I: Scoping Level Ecological Risk Assessment

The ERA method for Level I follows guidance documents listed in Section 7.3.1. Level I is intended to evaluate if the AOC had past releases or the potential for current contamination, and if there are important ecological resources on or near the AOC.

The following two questions should be answered at the completion of the Level I ERA:

1. **Are current or past releases suspected at the AOC?** Current or past releases are determined by evidence that chemical contaminants or COPECs are present.

2. **Are important ecological resources present at or in the locality of the AOC?** Important ecological resources are defined in the *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2008) and *Technical Document for Ecological Risk Assessment: Process for Developing Management Goals* (BTAG 2005). If an AOC has contaminants but lacks important ecological resources, this indicates the ERA process can stop at Level I. Contamination and important ecological resources must both be present to proceed to a Level II Screening Level ERA.

7.3.2.1 AOC Description and Land Use

Anchor Test Area is approximately 0.5 acres in size. The habitat is forest and is not large enough to completely support cover and food for small birds and mammals that typically require approximately 1 acre (USEPA 1993). The habitat area at Anchor Test Area represents approximately 0.002% of the 21,683 acres at RVAAP.

The planned land use at Anchor Test Area is National Guard Training including dismounted training. U.S. Army natural and ecological resource management activities may apply if habitat disturbance occurs.

7.3.2.2 Evidence of Historical Chemical Contamination

The goal of the historical ERA (MKM 2007) was to identify COPECs in soil for Anchor Test Area. The historical ERA followed instructions presented in the *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2003) and consisted of the first two of six steps listed in Figure III of the FWERWP (USACE 2003c). These two steps identify the evaluation procedures, which were used to determine AOC-related COPECs. First, the MDC of each chemical was compared to its respective facility-wide background concentration. Chemicals were not considered COPECs if the MDC was below the background concentration. For all chemicals detected above background concentrations, the MDC was compared to an ESV. The hierarchy of screening values was based on the guidance included in the FWERWP and *Guidance for Conducting Ecological Risk Assessments* (Ohio EPA 2003). In addition to the ESV comparison, it was determined if the chemical was a persistent, bioaccumulative, and toxic (PBT) chemical. Chemicals were retained as COPECs if they exceeded background concentrations and the ESV, if the chemical exceeded background concentrations and had no toxicity information, or if the chemical was considered a PBT chemical.

Groundwater was not included in the historical ERA. As explained in Section 3.2.2 of the FWERWP, groundwater is not considered an exposure medium to ecological receptors because these receptors are unlikely to contact groundwater greater than 5 ft bgs. As discussed in Section 3.4.2, the water table in the unconsolidated zone occurs at approximately 8.7-13.0 ft bgs. In addition, sediment and surface water do not exist at Anchor Test Area.

The historical ERA table for soil is included in Appendix Table H-1 and contains the following:

- Frequency of detection;
- Average concentration;
- MDC;
- Background concentration;
- SRC determination;
- ESVs used for COPEC determinations;
- PBT chemical identification;
- COPEC determination; and
- COPEC rationale.

Historical COPECs for Soil. The historical ERA conducted as part of the Characterization of 14 AOCs reported twenty-three chemicals in surface soil (0-1 ft) at Anchor Test Area (MKM 2007). Of the twenty-three chemicals detected, four chemicals (calcium, magnesium, potassium, and sodium) were essential nutrients and were excluded from the COPEC screen. Twelve detected inorganic chemicals and one organic chemical were determined to be SRCs because they either exceeded background concentrations or did not have an associated background concentration for comparison. Four of the inorganic chemicals (arsenic, chromium, manganese, and mercury) were identified as COPECs because detected concentrations were above ESVs (Table 7-10).

Table 7-10. Summary of Historical COPECs per the Characterization of 14 AOCs

Group	COPEC	Shallow Soil	Sediment	Surface Water
Inorganic chemicals	Arsenic	X	--	--
	Chromium	X	--	--
	Manganese	X	--	--
	Mercury	X	--	--

Adapted from Table LL5-17 from the Characterization of 14 AOCs (MKM 2007)
COPEC = Chemical of Potential Ecological Concern
-- = Chemical not identified as a COPEC in this data set
X = Quantitative COPEC, exceeds ecological screening value (ESV)

Historical COPECs for Sediment. No historical sediment samples were collected at the AOC.

Historical COPECs for Surface Water. No historical surface water samples were collected at the AOC.

Summary of Historical ERA. As explained previously, a historical ERA was performed to determine COPECs at Anchor Test Area in surface soil. HQs were not calculated in this evaluation. The COPECs are summarized in Table 7-10. Based on the identification of COPECs, ecological risk in surface soil was predicted in the historical investigation, and an additional investigation was recommended for Anchor Test Area (MKM 2007).

Additional information about contamination is shown in Section 7.3.2.5 and Appendix Tables H-2 and H-3.

7.3.2.3 Ecological Significance

Sources of data and information about the ecological resources at Anchor Test Area include the *Integrated Natural Resource Management Plan* (INRMP) (OHARNG 2008), *Facility-Wide Biological and Water Quality Study* (USACE 2005b) where applicable, previous characterization work (e.g., Characterization of 14 AOCs), and visits to the AOC conducted for the PBA08 RI.

One of the two key questions to answer in the Level I Scoping ERA is whether there are ecologically important and especially ecologically significant resources at Anchor Test Area. Ecological importance is defined as a place or resource that exhibits unique, special, or other attributes that makes it of great value. Ecological significance is defined as an important resource found at an AOC or in its vicinity that is subject to contaminant exposure. The underlying basis for this distinction can be found in *Ecological Significance and Selection of Candidate Assessment Endpoints* (USEPA 1996a), stated as follows:

> "A critical element in the ERA process requires distinguishing important environmental responses to chemical releases from those that are inconsequential to the ecosystem in which the site resides: in other words, determining the ecological significance of past, current, or projected site-related effects."

Important places and resources identified by the U.S. Army and Ohio EPA (Appendix Table H-4) include wetlands, terrestrial areas used for breeding by large or dense aggregations of animals, habitat known to be used by threatened or endangered species, state land designated for wildlife or game management, locally important ecological places, and state parks. Both the U.S. Army and Ohio EPA recognize 17 important places and resources. The U.S. Army recognizes an additional 16 important places (BTAG 2005), and the Ohio EPA recognizes another 6 important places (Ohio EPA 2008). In total, there are 39 important places. Presence or absence of an ecologically important place can be determined by comparing environmental facts and characteristics of Anchor Test Area with each of the important places and resources listed in Appendix Table H-4.

Ecological significance is defined as an important resource found at an AOC or in its vicinity that is subject to contaminant exposure. Thus, any important places and resources listed in Appendix Table H-4 are elevated to ecologically significant when present on the AOC and there is exposure to contaminants. For all 39 important places and resources, it is relatively clear that the ecological place or resource is either present or absent on the AOC; therefore, the decision process is objective. If no important or significant resource is present at an AOC, the evaluation will not proceed to Level II regardless of the presence of contamination. Instead, the Level I Scoping ERA would acknowledge there are important ecological places but that those resources are not ecologically significant and no further evaluation is required.

Management Goals for the AOC. Regardless of whether the evaluation is concluded at Level I or continues to Level II, there is another level of environmental protection for Anchor Test Area through the natural resource management goals expressed in the INRMP (OHARNG 2008). The U.S. Army is required to monitor ecological conditions to maintain or enhance the current integrity of the natural resources and ecosystem. While the monitoring focuses on the potential adverse effects from training activities, degradation from contamination would be noticed as well.

Some Natural Resources Management Goals of OHARNG (listed in Appendix Table H-5) benefit Anchor Test Area. For example, Goal 1 states the natural resources need to be managed in a compatible way with the military mission, and Goal 5 requires the U.S. Army to sustain usable training lands and natural resources. These management goals help detect degradation (whether from training activities or historical contamination). While the applicability of the remaining 9 management goals to Anchor Test Area varies, all of the management goals are intended to either monitor, maintain, or enhance the facility's natural resources and ecosystem. While these goals are for the management of all types of resources at and near Anchor Test Area, they do not affect the decisions already concluded in Section 7.3.2.3 concerning the presence or absence of important or significant ecological places or resources at Anchor Test Area.

Important Places and Resources. Ecological importance means a place or resource that exhibits a unique, special, or other attribute that makes it of great value. Examples of important places and resources include wetlands, terrestrial areas used for breeding by large or dense aggregations of animals, and habitat of state-listed or federally-listed species. An important resource becomes

significant when found on an AOC and there is contaminant exposure. There is no important/significant ecological resource at Anchor Test Area (Appendix Table H-4).

Terrestrial Resources. Anchor Test Area is dominated by terrestrial resources, as described below.

Habitat Descriptions and Species. The INRMP and AOC visits showed that Anchor Test Area consists of one predominate vegetation type (Photograph 7-1 and Figure 7-1) which is a forest alliance consisting of green ash (*Fraxinus pennsylvanica),* American elm (*Ulmus americana*), and hackberry (*Celtis occidentalis* and *laevigata*) (OHARNG 2008). This characterization was originally established by a vegetation study using aerial photography and field verification (USACE 1999) and was later used in the INRMP (OHARNG 2008). The habitat was assessed to be healthy and functioning based on May 2008 (Photograph 7-1) and November 2008 observations by biologists. Functional habitat was determined by noting the absence of large bare spots and dead vegetation or other obvious visual signs of an unhealthy ecosystem.

Photograph 7-1. May 2008 Habitat Conditions at Anchor Test Area

The forest includes small open areas and understory that result in multi-story vegetation. This, in turn, provides various layers of vegetation for foraging height preferences of birds, mammals, insects, and other organisms. An additional photograph of the habitat is provided in Appendix H.

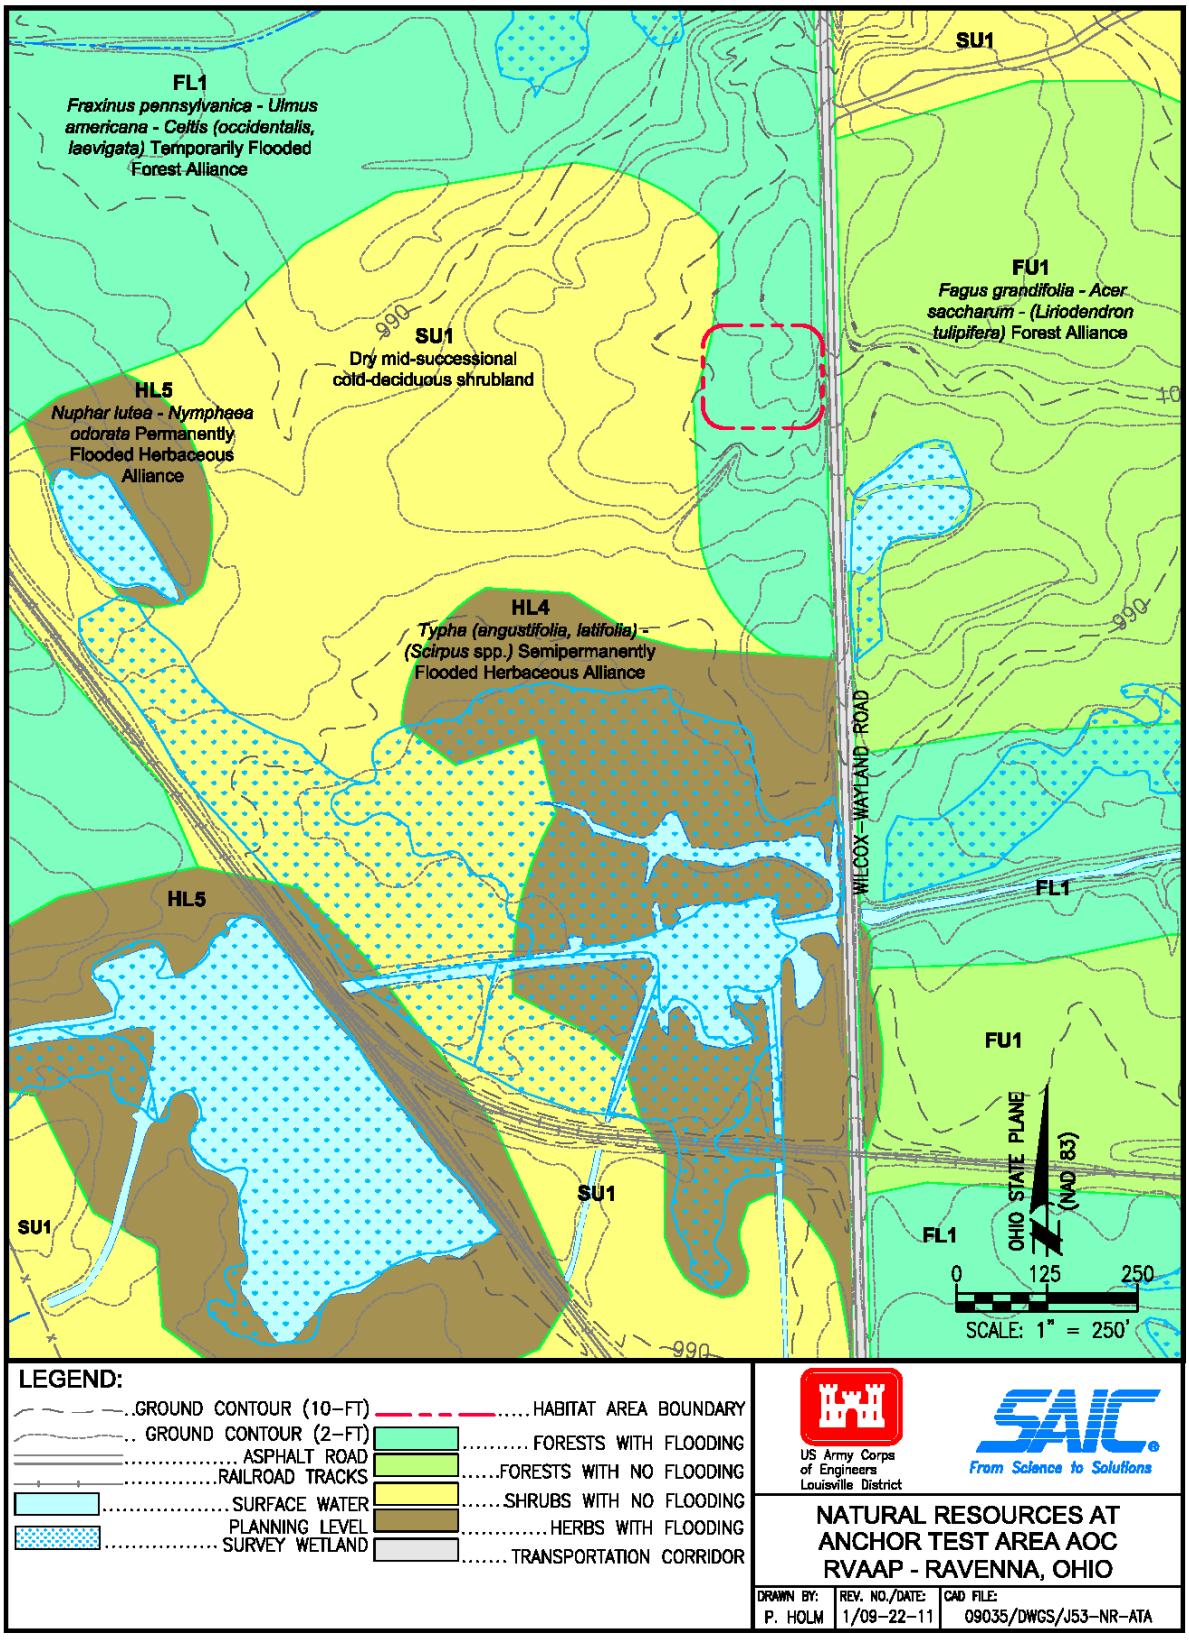

Figure 7-1. Natural Resources (OHARNG 2008) Inside and Near Habitat Area at Anchor Test Area

Threatened and Endangered and Other State-listed or Federally-listed Species. There are currently no federally-listed species or critical habitat on Camp Ravenna. Anchor Test Area has not been previously surveyed for state-listed or federally-listed species; however, there have been no documented sightings of threatened or endangered species at the AOC (OHARNG 2008).

Other Terrestrial Resources. While there are no other known important features, there are other resources at or near Anchor Test Area (e.g., vegetation, animals) that interact in their ecosystems and support nutrient cycling and energy flow. For example, wildlife such as wild turkey (*Meleagris gallopavo*) and white-tailed deer (*Odocoileus virginianus*) could use the area. The INRMP provides information about species and habitat surveys at RVAAP (e.g., timber and ecological succession) (OHARNG 2008). Aside from the natural resource map in the INRMP (OHARNG 2008) as shown in Figure 7-1, there are no other reported surveys of habitats and animals at Anchor Test Area.

Aquatic Resources. Wetlands are important habitats with water-saturated soil or sediment whose plant life can survive saturation. Wetlands are home to many different species and are chemical sinks that can serve as detoxifiers and natural water purifiers. However, there are no wetlands at Anchor Test Area to perform this and related functions. There are no ditches, streams, and ponds at Anchor Test Area.

Ecosystem and Landscape Roles and Relationships. There are four spatial areas evaluated to assess the ecosystem and landscape roles and relationships: the actual AOC, the vicinity of the AOC, the entire RVAAP, and the northeastern or ecoregion of Ohio. Information about the first spatial area (the actual AOC) was provided in the section above on terrestrial and aquatic resources.

Vicinity of the AOC. Three vegetation communities border Anchor Test Area (Figure 7-1) and include a variety of forest and shrubland communities. There are no apparent differences in habitat quality of these plant communities inside or outside of the AOC. For example, the dominant forest alliance [green ash (*Fraxinus pennsylvanica*), American elm (*Ulmus americana*), and hackberry (*Celtis occidentalis* and *laevigata*)] located at Anchor Test Area extends at least 300 ft beyond the northern and southern boundaries of the AOC. Directly west of the AOC lies dry, mid-successional, cold-deciduous shrubland. Across Wilcox-Wayland Road to the east is another forest alliance that consists of American beech (*Fagus grandifolia*), sugar maple (*Acer saccharum*), and American tulip tree (*Liriodendron tulipifera*). The types and qualities of habitat are not unique and can be found at many other areas at RVAAP.

The nearest stream is approximately 700 ft south of Anchor Test Area. Figure 7-1 shows there are no wetlands located at the AOC. The closest recorded wetland is a small area approximately 100 ft to the southeast (Figure 7-1); however, it is located east of Wilcox-Wayland Road and is in a different watershed than Anchor Test Area. The next closest wetland is approximately 400-500 ft south of the AOC. By definition, this wetland is considered an important ecological resource (U.S. Army 2005); however, it is located far enough from the AOC that it is unlikely to be impacted by contamination present at Anchor Test Area.

The closest recorded state-listed or federally-listed species [Woodland jumping mouse (*Napaeozapus insignis*)] is located approximately 2,400 ft northeast of the AOC (Table 7-11). The next closest state-listed or federally-listed species [Golden-winged warbler (*Vermivora chrysoptera*)] is located about 2,900 ft east of the AOC.

Table 7-11 shows no wetlands connected to Anchor Test Area. Additionally, no beaver dams, 100-year floodplains, or biological/water quality sampling stations are in or near the AOC. The nearest resources of these types are more than 2,000 ft away.

Table 7-11. Survey of Proximity to the AOC of Various Ecological Resources

Natural Resource	Inside Habitat Area	Near the AOC	Distances to Nearest Resource[a] and Comments
Wetlands (Planning Level Survey)	None	Yes, 100 ft to the southeast but no connection	Others around 400-500 ft and greater distances, to the south and north
State-listed or Federally-listed species	None	None	2,400 ft northeast 2,900 ft east See text for species names
Beaver dams	None	None	Nearest beaver dams located 2,400 ft northeast and 3,300 ft north
100-year floodplain	None	None	Nearest 3,100 ft north
Stream sampling[b]	None	None	Nearest stream station located about 4,000 ft southeast
Pond sampling[b]	None	None	Nearest pond station located about 3,800 ft southeast

[a] Measurements of distance and direction are taken from the nearest boundary of the AOC to the resource being measured.
[b] Stream and pond sampling refers to *Facility-Wide Biological and Water Quality Study 2003* (USACE 2005b).
AOC = Area of Concern

The Entire RVAAP. Anchor Test Area is considered small (0.5 acres in size). This represents approximately 0.002% of the entire area of RVAAP (approximately 21,683 acres in size). There is approximately 2,280 acres of the green ash, American elm, and hackberry forest at RVAAP (OHARNG 2008), representing about 10.5% of the forest vegetation types at RVAAP. Thus, this type of resource is abundant and is not unique to Anchor Test Area.

Ecoregion. In the area surrounding RVAAP, forests occupy a high percentage of the terrain. For example, Ohio's forests cover approximately 8,000,000 acres or 30% of the state (USDA 2009). The Erie/Ontario Drift and Lake Plain ecoregion (USEPA 2011) is located in the northeastern part of Ohio that contains the forest alliance of green ash (*Fraxinus pennsyvlvanica*), American elm (*Ulmus americana*), and hackberry (*Celtis occidentalis* and *laevigata*). This ecoregion is made up of rolling to level terrain and low lime drift and lacustrine deposits. Lakes, wetlands, and swampy streams occur where stream networks converge or where the land is flat and clayey (USEPA 2011). The same ecoregion and forest alliance is found throughout northeastern Ohio and also in Cuyahoga, Geauga, Mahoning, Portage, Stark, Summit, and Trumbull counties that surround RVAAP. The United States Forest Service (USFS) has a Forest Inventory Data Online tool that was queried for the forest alliance in the surrounding counties in or near RVAAP (USFS 2011). The hackberry (*Celtis occidentalis* and *laevigata)* was not individually found in this query, but other sources (Kloss 2011 and ODNR 2011) verified the presence of the hackberry in these counties. In 2009, a total of 94,000 acres of green ash

and American elm forest type were present in Cuyahoga, Geauga, Mahoning, Portage, Stark, Summit, and Trumbull counties (USFS 2011). Thus, the forest alliance at Anchor Test Area is also found in the surrounding counties in the ecoregion of northeastern Ohio.

In summary, the forest type of green ash, American elm, and hackberry is found at and in the vicinity of Anchor Test Area. This forest type is in abundance at RVAAP and the larger surrounding local ecoregion. Thus, there is no known unique resource at Anchor Test Area that cannot be found in the immediate vicinity of the AOC, RVAAP, or in a large part of the ecoregion of Northeastern Ohio.

7.3.2.4 Evaluation of Historical Chemical Contamination and Ecological Significance

There are four historical COPECs identified in the historical ERA as part of the Characterization of 14 AOCs: arsenic, chromium, manganese, and mercury (Section 7.3.2.2). The number of historical COPECs is low (Appendix Table H-1). Section 7.3.2.3 provides information about the lack of important/significant ecological resources at the AOC. There is no wetland, no state-listed or federally-listed species, and no other important/significant ecological resources, as defined by the U.S. Army and Ohio EPA. Section 7.3.2.6 summarizes the chemicals and resources to demonstrate there is a small amount of contamination at Anchor Test Area, but no important/significant ecological resources are present.

7.3.2.5 Evaluation of Current Chemical Contamination

This section provides information about methods and results of the analysis of current and historical chemical contamination.

The screening level approach to evaluate sample results from the PBA08 RI followed a similar approach as used in the historical ERA. Section 5.1 details chemical concentration data. The PBA08 RI evaluation uses ISM soil data collected during the PBA08 RI and ISM soil data used in the historical ERA. The PBA08 RI included collection of surface soil (0-1 ft bgs) samples at locations different from the historical soil sample locations (see Figures 5-2 and 5-3). This ERA uses ESVs that follow the revised *Ecological Risk Assessment Guidance* (Ohio EPA 2008), as provided in Appendix Table H-2. Ratios of MDC to ESV are used to determine the integrated COPECs that result from the combined current and historical data sets. A ratio greater than 1 suggests a possible environmental consequence. Any chemicals with ratios greater than 1 are identified as integrated COPECs. Also, a PBT compound becomes an integrated COPEC.

Integrated COPECs in Surface Soil (0-1 ft bgs). Five chemicals (calcium, iron, magnesium, potassium, and sodium) were essential nutrients and were excluded as SRCs, as described in Section 5.1. Ten detected inorganic chemicals and four organic chemicals were determined to be SRCs because they either exceeded background concentrations or did not have an associated background concentration for comparison. Of the 14 SRCs, 4 chemicals exceeded the ESVs and are identified as integrated COPECs (Table 7-12). The calculated ratio of MDC to ESV is shown in Table 7-12 for each integrated COPEC. Appendix Table H-3 presents the details of the ESV comparisons.

Table 7-12. Summary of Integrated COPECs

COPEC	Maximum Concentration (mg/kg)	ESV (mg/kg)	Ratio of Maximum to ESV	Comments
Arsenic	54	18	3	None
Chromium	42.3	26	1.6	None
Manganese	1500	220	6.8	Next highest ratio at 6.8x
Mercury	0.062	0.00051	121.6	Highest ratio at 122x

Table excludes nutrients
COPEC = Chemical of Potential Ecological Concern
ESV = Ecological Screening Value
x = Multiplier

For Anchor Test Area, the integrated findings regarding COPECs confirm the historical findings about COPECs presented in Table 7-10. Specifically, there are a few inorganic chemicals exceeding background concentrations and ecological screening levels.

Current Sediment. No sediment was available for collection at Anchor Test Area.

Current Surface Water. No surface water was available at Anchor Test Area.

Summary of ERA Findings. There are four integrated COPECs identified in soil at Anchor Test Area: arsenic, chromium, manganese, and mercury. Mercury has the highest MDC-to-ESV ratio and is of highest concern. Sediment or surface water do not exist at the AOC so no COPECs were identified.

7.3.2.6 Summary and Recommendations of Scoping Level Ecological Risk Assessment

Based on information from the Characterization of 14 AOCs and the PBA08 RI, there are four integrated soil COPECs at Anchor Test Area: arsenic, chromium, manganese, and mercury. The ratios of the maximum concentrations to conservative ESVs range from 122 for mercury to 2 for chromium. Thus, there are a small number of integrated COPECs. There is no sediment or surface water at Anchor Test Area.

The information in Section 7.3.2.3 about ecological resources at Anchor Test Area was compared to the list of important ecological places and resources (Appendix Table H-4). None of the 39 important places were present, and there is nothing ecologically significant at Anchor Test Area. Environmental management goals and objectives of OHARNG are applicable to Anchor Test Area, as presented in Appendix Table H-5. Some of the management goals benefit Anchor Test Area, including Goal 1 that requires management of natural resources to be compatible with military mission, and Goal 5 that requires the U.S. Army to sustain usable training lands and natural resources.

The forest type at Anchor Test Area is green ash, American elm, and hackberry on approximately 0.5 acres. This same type of habitat is found adjacent to the AOC and elsewhere at RVAAP (OHARNG 2008). The habitat is also found in the larger surrounding local ecoregion (USFS 2011 and Kloss 2011). Thus, there is no known unique resource at Anchor Test Area.

Accordingly, although there is contamination at Anchor Test Area, the AOC has no important/significant ecological places or resources. Consequently, the ERA for Anchor Test Area can conclude with a Level I Scoping Level Risk Assessment with the recommendation of NFA from the ecological risk perspective.

7.3.3 Conclusions

There is a small amount of chemical contamination present in the soil at Anchor Test Area. There are four integrated soil COPECs (arsenic, chromium, manganese, and mercury). There is no sediment or surface water at the AOC. There are no important/significant ecological resources at the Anchor Test Area and its 0.5 acres of habitat according to U.S. Army and Ohio EPA lists of important places and resources. Further, the green ash, American elm, and hackberry forest type is found elsewhere near the AOC, at RVAAP, and in the ecoregion. Per guidance from the Ohio EPA, there is sufficient justification to recommend NFA for Anchor Test Area from the ecological perspective.

THIS PAGE INTENTIONALLY LEFT BLANK.

8.0 REMEDIAL INVESTIGATION CONCLUSIONS AND RECOMMENDATIONS

8.1 INTRODUCTION

The PBA08 RI for Anchor Test Area presents a detailed analysis of historical and newly acquired environmental data. The following sections present an overview of the major findings of the nature and extent of contamination, modeling of contaminant fate and transport, HHRA, and ERA. An updated CSM incorporating all available information is presented to integrate results of the RI. The CSM denotes, based on available data, where source areas occur, the mechanisms for contaminant migration from source areas to receptor media (e.g., surface water and groundwater), exit pathways from the AOC, and where COCs occur that may require further evaluation in an FS. This section concludes with recommendations with respect to the need for any further characterization under the RI phase of work and, for each of the media evaluated in the RI, whether to proceed to the FS phase of the RI/FS process.

8.2 SUMMARY OF DATA USED IN THE REMEDIAL INVESTIGATION

Available data collected at Anchor Test Area represent conditions of the AOC over a span of approximately 6 years and were collected using discrete and ISM. Quality assured sample data were collected during investigations completed in 2004 during the Characterization of 14 AOCs and 2010 during the PBA08 RI. There have been no substantial changes in physical conditions at the AOC (e.g., construction, demolition, and grading) during the intervening time between 2004 and 2010. A systematic process was used to evaluate data usability in the RI based on project DQOs, data age and representativeness with respect to current AOC conditions, and sampling methods. All discrete and ISM data collected in 2004 and 2010 were deemed usable for this RI/FS report. Section 5.1.4 summarizes the results of the data usability evaluation for all available Anchor Test Area samples.

ISM surface soil data collected in 2004 and 2010 were used to screen for SRCs and for conducting the risk assessments. All available discrete and ISM data were incorporated into the contaminant nature and extent evaluation to identify potential temporal and longitudinal trends. All available discrete and ISM surface soil data were incorporated into fate and transport modeling. For subsurface soil, only 2010 discrete sample data were available for use in all evaluations performed in this RI. No surface water or sediment data exist due to absence of these media at the AOC.

8.3 SUMMARY OF NATURE AND EXTENT

The highest concentrations of inorganic SRCs were observed in historical ISM sample locations ATAss-005M and ATAss-001M (former sand pit), and at PBA08 RI sample locations ATAss-015M and ATAss-016M. These samples also contained the greatest number of inorganic SRCs per sample above background concentrations; although two of the six total SRCs present in these samples have background concentrations of 0 mg/kg (cadmium and thallium). Four SVOCs [2-methylnaphthalene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate, and naphthalene] were identified as SRCs at the

AOC, with three of these SVOCs [2-methylnaphthalene, bis(2-ethylhexyl)phthalate, and naphthalene] occurring at one sample location (ATAss-015M). No explosives, propellants, VOCs, pesticides, or PCBs were identified as SRCs in surface soil at this AOC.

Soil overburden is greater than 13 ft in thickness across the AOC, with groundwater encountered at approximately 8.7-13 ft bgs. Detectable concentrations of cadmium and silver were ubiquitous in the subsurface soil samples, although no spatial or vertical trends were evident and both metals occurred within a narrow range of concentrations. One SVOC [bis(2-ethylhexy)phthalate] and two VOCs (methylene chloride and toluene) were detected at location ATAsb-008. All three organic chemicals were detected in the 4-7 ft bgs interval, and one VOC (toluene) was detected in the 1.0-4.0 ft bgs interval. Explosives, propellants, and PCBs were not detected in any subsurface soil sample.

8.4 SUMMARY OF CONTAMINANT FATE AND TRANSPORT

Contaminant fate and transport evaluation included a soil screening analysis to determine initial CMCOPCs, an analysis of contaminant leaching and migration from soil to groundwater (vertical transport) to determine final CMCOPCs, and an analysis of contaminant migration from beneath the source area to a downgradient receptor (horizontal transport) to determine CMCOCs.

A soil screening analysis identified initial CMCOPCs having concentrations exceeding initial screening criteria (MCLs/RSLs, facility-wide background concentrations, and SSSLs) and predicted travel times to reach the water table (7 ft bgs for Anchor Test Area initial CMCOPCs) of less than 1,000 years. One inorganic chemical (arsenic) and one organic chemical (naphthalene) had maximum concentrations and travel times that exceeded these screening criteria. The maximum concentrations of these initial CMCOPCs occurred at two separate ISM areas within Anchor Test Area: ATAss-005M contained the maximum concentrations of arsenic, and ATAss-015M contained the maximum concentration of naphthalene. These chemicals were retained as initial CMCOPCs and further evaluated using vertical transport modeling (SESOIL).

SESOIL modeling predicted the maximum concentration of arsenic (0.953 mg/L) in leachate below its source area would exceed the screening criteria (facility-wide background concentration of 0.0117 mg/L) at a future point in time. Therefore, arsenic was designated as a final CMCOPC and evaluated using lateral transport modeling (AT123D). Naphthalene (maximum leachate concentration of 0.00184 mg/L as compared to its MCL/RSL of 0.00620 mg/L) was excluded as a final CMCOPC for further evaluation based on the SESOIL modeling results. AT123D modeling predicted the maximum concentration of arsenic (0.0473 mg/L) to exceed the screening criteria facility-wide background concentration (0.0117 mg/L) beneath the source area and was modeled to its downgradient receptor (wetland area southeast of the AOC). Modeling of lateral migration from beneath the source area approximately 200 ft to the downgradient receptor showed the maximum predicted concentration of arsenic (0.000587 mg/L) will not exceed the MCL/RSL, FWCUG, or facility-wide background concentration. On this basis, arsenic was eliminated from further consideration as a CMCOC.

Based on the soil screening analyses and fate and transport modeling, all SRCs found in the surface and subsurface soil samples and evaluated through the stepwise fate and transport screening evaluation presented here are eliminated as posing future impacts to groundwater.

8.5 SUMMARY AND CONCLUSIONS OF THE HUMAN HEALTH RISK ASSESSMENT

The HHRA identified COCs and conducted risk management analysis to determine those COCs requiring evaluation in an FS based on potential risk to human receptors. The representative human receptor scenario for the HHRA is the National Guard Trainee based on the OHARNG projected future land-use for Anchor Test Area. The risk assessment also included an evaluation of the Resident Farmer receptor scenario to evaluate an unrestricted land use option. Media evaluated in the HHRA are surface soil and subsurface soil. Surface water and sediment are not present at this AOC.

Arsenic was identified as a COC in ISM shallow surface soil (0-1 ft bgs) sample location ATAss-005M for both the National Guard Trainee and the Resident Farmer receptors. No COPCs and no COCs were identified in deep surface soil (1-4 ft bgs) or subsurface soil (4-7 ft bgs) for the National Guard Trainee. No COPCs and no COCs were identified in subsurface soil (1-13 ft) for the Resident Farmer receptor.

8.6 SUMMARY AND CONCLUSIONS OF THE ECOLOGICAL RISK ASSESSMENT

There are four integrated soil COPECs based on the historical and current information at Anchor Test Area: arsenic, chromium, manganese, and mercury. The number of COPECs is low. Ecological resources at Anchor Test Area were compared to the list of important ecological places and resources. None of the 39 important places were present, and there is nothing ecologically significant at Anchor Test Area. The ERA summarizes the chemicals and resources in detail to demonstrate there is a small amount of contamination at the Anchor Test Area, but no important or significant ecological resources are present. Consequently, the ERA for Anchor Test Area concludes with a Level I Scoping Level Risk Assessment, with a recommendation of NFA from the ecological risk perspective.

8.7 UPDATED CONCEPTUAL SITE MODEL

The preliminary CSM for Anchor Test Area is summarized in Section 3.7. The CSM is updated in this section to incorporate results of the PBA08 RI. Elements of the CSM include:

- Primary and secondary contaminant sources and release mechanisms;
- Contaminant migration pathways and discharge or exit points;
- Potential receptors; and
- Data gaps and uncertainties.

Due to simplicity of this AOC, an illustrated summary of the CSM is not included. Reference is made to previous figures to assist in visualizing the key summary points of the revised CSM.

8.7.1 Primary and Secondary Contaminant Sources and Release Mechanisms

No primary contaminant sources (e.g., operational facilities or retention basins) exist at Anchor Test Area. The remnant sandpit, earthen blast barriers, and soil are considered as secondary sources of contamination. No perennial drainage conveyance exists in immediate vicinity of the AOC; therefore, surface water and sediment are not present. Surface soil only within sample area ATAss-005M (Figure 5-2) contained contaminants (arsenic) at sufficient concentration to be considered a human health COC. No other COCs were identified within the AOC. No COCs were identified in subsurface soil below 1 ft bgs for any receptor.

The primary mechanisms for release of contaminants from secondary sources at Anchor Test Area are the following:

- Erosion of soil matrices with sorbed contaminants and mobilization in overland surface water storm runoff during heavy rainfall conditions;
- Dissolution of soluble contaminants and transport in intermittent surface water runoff; and
- Contaminant leaching to groundwater.

8.7.2 Contaminant Migration Pathways and Exit Points

8.7.2.1 Surface Water Pathways

Migration of contaminants from soil sources via surface occurs primarily by: (1) movement of the particle-bound contaminants in surface water runoff; and (2) transport of dissolved chemicals in surface water. Upon reaching portions of surface water conveyances where flow velocities decrease, particle-bound contaminants will settle out as sediment accumulation. Sediment-bound contaminants may become re-suspended and migrate during storm events or may partition to dissolved phase in surface water. As noted in Section 3.0, there are no well-defined natural surface water conveyances or engineered storm water drainage systems exiting the AOC; therefore, the migration pathway is limited to diffuse overland flow through heavily vegetated terrain. Surface soil data indicate minimal dispersal of contaminants from the sample area ATAss-005M to the surrounding vicinity via this pathway given that arsenic concentrations were below background concentrations in the ISM sample delineating this secondary source (ATAss-016M, Figure 5-2).

8.7.2.2 Groundwater Pathways

The estimated direction of groundwater flow at Anchor Test Area is to the east based on RVAAP facility-wide potentiometric data. The groundwater table occurs within unconsolidated glacial overburden at depths of 8.7-13 ft bgs, based on 2010 soil boring data. Contaminant leaching pathways from soil to the water table are through interbedded clayey to sandy glacial till. Fate and

transport modeling results indicate that only arsenic may leach from surface soil in sample area ATAss-005M and migrate to groundwater below the source at concentrations above MCLs/RSLs and FWCUGs. However, the maximum predicted concentration in the groundwater table at the downgradient receptor (wetland area southeast of the AOC) is predicted to be less than the facility-wide background concentration. Additionally, migration of arsenic is likely to be attenuated within the unconsolidated zone because of moderate to high retardation factors within the unconsolidated zone. Based on the modeling results, migration of contaminants via the groundwater pathway is not expected.

8.7.3 Potential Receptors

As identified in the HHRA, the representative receptor under the RAFLU is the National Guard Trainee. An unrestricted land use receptor (i.e., Resident Farmer) was also evaluated in the HHRA for comparative purposes. Arsenic was identified as a COC within surface soil (0-1 ft bgs) for this land use scenario. Figure 5-2 illustrates those portions of the AOC that exceed the National Guard Trainee FWCUG for arsenic in surface soil. No COCs were identified for soil below 1 ft bgs for either the National Guard Trainee or the Resident Farmer. Ecological receptors at the AOC are potentially exposed to contaminants in surface soil (0-1 ft bgs). Aquatic habitat is not present on the AOC, which precludes exposures to aquatic organisms.

8.7.4 Uncertainties

Uncertainties are inherent in the CSM depending on the density and availability of data. The CSM for Anchor Test Area is overall well defined using existing data, and major data gaps do not remain to be resolved. However, some uncertainties with respect to groundwater for the CSM remain for the AOC.

A groundwater monitoring well network does not currently exist at the AOC. Groundwater quality data are not available and uncertainty exists with respect to groundwater flow directions and hydraulic gradient. As summarized above, fate and transport modeling does not indicate that the one identified CMCOPC (arsenic) will leach from soil and impact groundwater quality at the downgradient receptor at concentrations above facility-wide background concentrations. Further evaluation of groundwater at the AOC will be performed in a separate report.

8.8 RECOMMENDATIONS OF THE REMEDIAL INVESTIGATION

Based on the PBA08 RI results, soil, sediment, and surface water at Anchor Test Area has been adequately characterized, and the recommended path forward is to proceed to a FS. The FS will evaluate remedial alternatives to address arsenic contamination in shallow surface soil at ISM sampling areas ATAss-005M. The potential exposure medium and land use receptors associated with arsenic are summarized in Table 8-1, along with recommended CUGs for each of these land uses. Sediment and surface water does not exist at the AOC.

Analyses of remedial alternatives for soil are not warranted to protect ecological receptors based on the ERA. Analyses of remedial alternatives are not warranted for subsurface soil greater than 1 ft depth based on the absence of human health COCs. Soil remediation to protect groundwater resources is also not warranted based on contaminant leaching and fate and transport modeling results.

Table 8-1. Summary of COCs Identified for Evaluation in the FS

Media	Chemical of Concern	Cleanup Goal (mg/kg)
National Guard Trainee		
Shallow Surface Soil (0-1 ft bgs)	Arsenic	31[a]
Resident Farmer		
Shallow Surface Soil (0-1 ft bgs)	Arsenic	15.4[b]

[a] Cleanup goal (CUG) for arsenic in surface soil for the National Guard Trainee is the precedent CUG of 31 mg/kg from the *Interim Record of Decision for the Remediation of Soils at Load Lines 1 through 4* (USACE 2007a) and the *Record of Decision for Soil and Dry Sediment for RVAAP-12 Load Line 12* (USACE 2009b) as documented in Table 5-12 of the *Facility-Wide Human Health Cleanup Goals for the Ravenna Army Ammunition Plant* (USACE 2010a).
[b] CUG for residential land use is the facility-wide background concentration for RVAAP published in the *Phase II Remedial Investigation Report for Winklepeck Burning Grounds* (USACE 2001b) because the Facility-Wide Cleanup Goal (FWCUG) for the Resident Farmer is less than the background concentration.
bgs = below ground surface
COC = Chemical of Concern
FS = Feasibility Study
mg/kg = milligrams per kilogram

9.0 REMEDIAL ACTION OBJECTIVE, CLEANUP GOALS, AND VOLUME CALCULATIONS

This section presents the RAO, appropriate CUGs for remedial actions, and volume estimates of media requiring remediation to attain specific land use scenarios. The RAO is in accordance with the NCP and CERCLA RI/FS guidance, specifying receptors, exposure routes, and desired exposure levels. CUGs establish acceptable exposure levels protective of human health and the environment and consider potential land uses. The CUGs also provide the basis for screening, evaluating, and selecting a remedial alternative.

9.1 REASONABLE AND ANTICIPATED FUTURE LAND USE

The RAFLU for Anchor Test Area is National Guard Training with Digging. Consequently, the representative receptor at this AOC is the National Guard Trainee. The future land use and the selection of the appropriate receptors are discussed in more detail in Section 7.2.3.

Residential Land Use is not anticipated at RVAAP or at this AOC; however, an unrestricted land use scenario is developed and evaluated. Remediation to achieve CUGs protective of the Resident Farmer and the National Guard Trainee is protective of all potential RVAAP receptors, as established in the FWCUG Report. For the purposes of this RI/FS report, a combination of the most restrictive CUGs established for the National Guard Trainee and the Resident Farmer provides the requisite level of protectiveness for unrestricted land use.

9.2 REMEDIAL ACTION OBJECTIVE

The RAO for Anchor Test Area is to prevent: (1) National Guard Trainee exposure to identified COCs in soil above CUGs; (2) adverse ecological effects from previous AOC activities; and (3) negative groundwater impacts from contaminant migration from source media (e.g., soil).

Conclusions of the ERA (Section 7.3) indicate remedial actions are not warranted to specifically protect ecological receptors. Fate and transport modeling (Section 6.0) indicates soil remediation to protect groundwater is not warranted. Remedial actions specific to groundwater media at Anchor Test Area will be evaluated in a separate report. It is noted that anticipated remedial activities to protect the human receptor will benefit ecological resources and reduce the potential for contaminant migration to groundwater. Additionally, sediment and surface water do not exist at this AOC; consequently, there is no remediation required for these media.

9.3 REMEDIAL ACTION CLEANUP GOALS

Based on an evaluation of ISM sample results and EPCs calculated from discrete samples, the HHRA recommends CUGs to support the remedial alternative selection process for remediation. Tables 9-1 and 9-2 list the media, COCs, and CUGs associated with achieving the National Guard Training Land Use and an unrestricted land use (as represented by the National Guard Trainee and Resident Farmer

receptors). Arsenic in shallow surface soil is a COC for both land use scenarios. Remediation of arsenic in shallow surface soil to the CUG of 15.4 mg/kg will attain the RAO for the National Guard Trainee, as well as for unrestricted land use (combined National Guard Trainee and Resident Farmer receptors).

Table 9-1. Cleanup Goals for National Guard Training Land Use

Media	Chemical of Concern	Cleanup Goal (mg/kg)
Shallow Surface Soil (0-1 ft bgs)	Arsenic	31
Deep Surface Soil (1-4 ft bgs)	None	None
Subsurface Soil (4-7 ft bgs)	None	None

bgs = below ground surface
mg/kg = milligram per kilogram

Table 9-2. Cleanup Goals for National Guard Training and Residential Land Uses

Media	Chemical of Concern	Cleanup Goal (mg/kg)
Shallow Surface Soil (0-1 ft bgs)	Arsenic	15.4
Deep Surface Soil (1-4 ft bgs)	None	None
Subsurface Soil (1-13 ft bgs)	None	None

bgs = below ground surface
mg/kg = milligram per kilogram

9.4 VOLUME CALCULATIONS OF MEDIA REQUIRING REMEDIATION

Tables 9-3 and 9-4 provide the basis for volume estimations for areas requiring remediation. The contamination within shallow surface soil is assumed to be no more than 1 ft bgs. Figure 9-1 shows areas requiring remediation for the National Guard Training and Residential Land Use scenario.

Table 9-3. Estimated In Situ Soil Volume Requiring Remediation

ISM Sample Location	Media	Arsenic Concentration (mg/kg)	Surface Area (ft^2)	Treatment Interval (ft bgs)	In Situ Volume (ft^3)
National Guard Training and Residential Land Use					
ATAss-005M	Shallow Surface Soil	54	225	0-1	225

ISM = incremental sample methodology

Table 9-4. Estimated Volumes of Soil Requiring Remediation

Land Use Scenario and Media	In situ		In situ with Constructability[1]		Ex situ[1,2]	
	Volume (ft^3)	Volume (yd^3)	Volume (ft^3)	Volume (yd^3)	Volume (ft^3)	Volume (yd^3)
National Guard Training and Residential Land Uses ~ Surface Soil	225	9	281	11	338	14

Constructability accounts for over excavation, sloping of sidewalls, and addresses limitations of removal equipment. The in situ volume is increased by 25% for a constructability factor.
[1]Includes 25% constructability factor
[2]Includes 20% swell factor

THIS PAGE INTENTIONALLY LEFT BLANK.

10.0 APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

10.1 INTRODUCTION

CERCLA Section 121 specifies remedial actions must comply with requirements or standards under federal or more stringent state environmental laws that are "applicable or relevant and appropriate to the hazardous substances or particular circumstances at the AOC." Inherent in the interpretation of ARARs is the assumption that protection of human health and the environment is ensured. This section summarizes potential federal and state chemical-, location-, and action-specific ARARs for the potential remedial actions at the AOC.

ARARs include those federal and state regulations that are designed to protect the environment. Applicable requirements are "those cleanup standards, standards of control, and other substantive environmental protection requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting law that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance at a CERCLA site" [40 Code of Federal Regulations (CFR) 300.5]. USEPA has stated in the NCP that applicable requirements are those requirements that would apply if the response action were not taken under CERCLA.

Relevant and appropriate requirements are "those cleanup standards, standards of control, and other substantive environmental protection requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting law that, while not applicable to a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance at a CERCLA site, address problems or situations sufficiently similar to those encountered at the CERCLA site such that their use is well suited to the particular site" (40 CFR 300.5).

In the absence of federal or state-promulgated regulations, there are many criteria, advisories, guidance values, and proposed standards that are not legally binding but may serve as useful guidance for setting protective cleanup levels. These are not potential ARARs but are to-be-considered guidance [40 CFR 300.400(g)(13)].

CERCLA remedial response actions at an AOC must comply only with the substantive requirements of a regulation [CERCLA Section 121(e)]. Substantive requirements are those that pertain directly to the actions or conditions at an AOC, while administrative requirements facilitate their implementation. USEPA recognizes that certain administrative requirements (e.g., consultation with state agencies, reporting) are accomplished through state involvement and public participation. These administrative requirements should also be observed if they are useful in determining cleanup standards at the AOC (55 CFR 8757).

Although remedial actions for AOCs at National Priorities List (NPL) sites must comply only with the substantive requirements of federal or state environmental regulations, the Ohio Revised Code does not provide a similar permit waiver for actions conducted under the Ohio EPA Remedial Response Program Policy. The Ohio EPA's DERR Policy DERR-00-RR-034 states, "it has been DERR's policy to require responsible parties to acquire and comply with all necessary permits, including the substantive and administrative requirements." However, a DFFO was entered into on June 10, 2004, that provided certain exemptions from the Ohio Administrative Code (OAC) administrative requirements and required groundwater monitoring and remediation at RVAAP to be performed under the CERCLA process. The DFFO includes provisions for compliance resulting in the potential negation of all provided exemptions within the DFFO in the event non-compliant activities are identified.

10.2 POTENTIAL ARARS

USEPA classifies ARARs as chemical-specific, action-specific, and location-specific to provide guidance for identifying and complying with ARARs (USEPA 1988):

- Chemical-specific ARARs are health- or risk-based numerical values or methodologies which, when applied to site-specific conditions, allow numerical values to be established. These values establish the acceptable amount or concentration of a chemical that may be found in, or discharged to, the ambient environment (USEPA 1988).

- Action-specific ARARs are rules, such as performance or design or other activity-based rules, which place requirements or limitations on actions.

- Location-specific ARARs are rules that place restrictions on the concentration of hazardous substances or the conduct of activities solely because they occur in special locations (USEPA 1988).

As explained in the following paragraph, rules from each of these categories are ARARs only to the extent that they relate to the degree of cleanup.

CERCLA Section 121 governs cleanup standards at CERCLA sites. ARARs originate in the subsection of CERCLA that specifies the degree of cleanup at each AOC, CERCLA Section 121(d). In Section 121(d)(2), CERCLA expressly directs that ARARs are to address specific contaminants of concern at each AOC, specifying the level of protection to be attained by any chemicals remaining at the AOC. CERCLA Section 121(d)(2) provides that with respect to hazardous substances, pollutants, or contaminants remaining on-site at the completion of a remedial action, an ARAR is:

> "any standard, requirement, criteria, or limitation under any Federal environmental law … or any promulgated standard, requirement, criteria, or limitation under a State environmental or facility siting law that is more stringent than any Federal standard, requirement, criteria, or limitation."

CERCLA Section 121(d)(2) further provides that the remedial action attains a level of control established in rules determined to be ARARs.

In some cases, most ARARs will be chemical-specific. Action- or location-specific requirements will be ARARs to the extent that they establish standards addressing COCs that will remain at the AOC. In addition, CERCLA Section 121(d)(1) directs that remedial actions taken to achieve a degree of cleanup that is protective of human health and the environment are to be relevant and appropriate under the circumstances presented by the release. Accordingly, any chemical-, action-, or location-specific requirements will be ARARs to the extent that they ensure the degree of cleanup will be protective of human health and the environment under the circumstances presented by the release.

In summary, chemical-, action-, or location-specific requirements will be ARARs to the extent that they establish standards protective of human health and the environment for chemicals that will remain on-site after the remedial action, and to the extent that they ensure a degree of cleanup that is protective of human health and the environment under the circumstances presented by the release.

10.2.1 Potential Chemical-Specific ARARs

The environmental medium evaluated in this FS is soil. COCs were identified in soil for receptors representing an unrestricted land use scenario. A review of the regulations indicates there are no potential chemical-specific ARARs for any of the contemplated alternatives due to the media and COCs. Potential chemical-specific ARARs are listed in Table 10-1.

10.2.2 Potential Action-Specific ARARs

Under the No-Action Alternative, no activities would be conducted at the AOC; therefore, no Action-Specific ARARs are identified for this alternative.

As discussed in Section 11.0, a portion of the alternatives evaluated include potential excavation and disposal of contaminated environmental media at the AOC. Implementation of this alternative triggers potential ARARs associated with land disturbance and emission controls. The OAC 3745-15-07 requires that nuisance air pollution emissions be controlled. This includes the control of potential fugitive dust from soil handling excavation activities. In addition, any construction (e.g., soil disturbance activities that would encompass over 1 acre in size) would trigger the storm water requirements found at 40 CFR Part 450. These requirements mandate that erosion and sedimentation control measures be designed and implemented to control erosion and sediment run-off.

Because excavation would include the generation and management of contaminated media, the requirements of the Resource Conservation and Recovery Act (RCRA) would be considered potential ARARs for this activity. The RCRA requirements mandate that a generator must determine whether a material is (or contains in the case of environmental media) a hazardous waste under OAC 3745-52-11. If a material is determined to be or contain a listed hazardous waste, or exhibits a hazardous

waste characteristic, additional management requirements under RCRA must be followed by an ARAR under CERCLA.

These requirements include the manner in which hazardous waste is stored, treated, transported, and disposed. These RCRA requirements are generally not considered to be chemical-specific ARARs because they do not relate directly to the degree of cleanup, or to specific chemicals. In addition to the substantive requirements associated with the management and storage of material that is also RCRA hazardous waste (or found to contain such waste), some RCRA requirements prescribe standards for disposal of hazardous material. These include: (1) land disposal restrictions (LDRs) prohibiting disposal of specific chemicals until they are treated to a specified level, or by a specific treatment technology; and (2) minimum technical requirements (MTRs) for land disposal units.

USEPA cautions that LDRs should not be used to determine site-specific cleanup levels for soil (USEPA 2002). The purpose of LDRs is to require appropriate treatment of RCRA hazardous waste that is to be land disposed of to minimize short and long-term threats to human health or the environment based upon available technology. Performing treatment to meet LDR standards is different from the CERCLA approach to remediation, which is analyzing risk and then developing soil cleanup standards based on the risk present, and may result in soil cleanup levels that are different from those of a risk-based approach. Nevertheless, if RCRA hazardous waste is generated from the CERCLA action and are land disposed of on-site, the material must meet the standards established in the LDRs.

In order for LDRs to be triggered as potential ARARs, RCRA hazardous waste must be present. This requires: (1) that soil contains contaminants that either derive from RCRA-listed waste, or that exhibits a characteristic of RCRA hazardous waste; and (2) that soil is managed in a way that "generates" hazardous waste. Several methods of soil management that do not "generate" hazardous waste and so do not trigger LDRs are available for use. These methods include the AOC approach, use of a staging pile, use of a storage or treatment corrective action management unit (CAMU), or use of a temporary unit (TU).

If soil is managed in a manner that generates hazardous waste, such as removing it to an above-ground container, and then redepositing the soil within the land unit for disposal, LDRs become potential ARARs. LDRs attach to the waste at the time it is removed from the unit under an AOC approach, or at the time the soil is excavated and lifted out of the unit. Potential LDR ARARs in Ohio are variances from treatment standards in OAC Section 3745-700-44, LDR standards for contaminated debris in OAC Section 3745-47, Universal Treatment Standards (UTS) in OAC Section 3745-270-48, and Alternative Standards for Contaminated Soil in OAC Section 3745-270-49.

Ohio has adopted the alternative soil treatment standards as promulgated by USEPA in its Phase IV LDR rule, effective August 1998. The rules provide that if RCRA hazardous waste is present, the material must meet one of two sets of LDRs before being disposed of in a land unit: (1) the UTS; or (2) the contaminated soil (technology-based treatment) standards promulgated in Phase IV of the LDRs, whichever is greater. Or, if a generator so chooses, he may use the generic treatment standards

in OAC Section 3745-270-40 which apply to all hazardous waste. Only the alternative soil treatment standards are explained in this document. Under the alternative soil treatment standards, all soil subject to treatment must be treated as follows:

1. For non-metals, treatment must achieve 90% reduction in total chemical concentration [primary chemical for which the waste is characteristically hazardous as well as for any organic or inorganic underlying hazardous constituent (UHC)], subject to item three below.

2. For inorganic chemicals, carbon disulfide, cyclohexanone, and methanol, treatment must achieve 90% reduction in chemical concentrations as measured in leachate from the treated media [tested according to the Toxicity Characteristic Leaching Procedure (TCLP)] or 90% reduction in total chemical concentrations (when a inorganic chemical removal treatment technology is used), subject to item 3 below.

3. When treatment of any chemical subject to treatment to a 90% reduction standard would result in a concentration less than 10 times the UTS for that chemical, treatment to achieve chemical concentrations less than 10 times the UTS is not required. This is commonly referred to as "90% capped by 10xUTS."

4. USEPA and Ohio EPA have established a site-specific variance from the soil treatment standards, which can be used when treatment to concentrations of hazardous chemicals greater (i.e., higher) than those specified in the soil treatment standards minimizes short- and long-term threats to human health and the environment. In this way, on a case-by-case basis, risk-based LDR treatment standards approved through a variance process could supersede the soil treatment standards. Any variance granted cannot rely on capping, containment, or other physical or institutional controls.

If CAMUs are used as disposal units at the AOC, the design and treatment standards established at OAC Section 3745-57-72 will be potentially relevant and appropriate to the response action. Only CAMU-eligible waste can be disposed of in a CAMU. CAMU-eligible waste includes hazardous and non-hazardous waste that are managed for implementing cleanup, depending on the Director's approval or prohibition of specific waste or waste streams. Use of a CAMU for disposal does not trigger LDRs or MTRs as long as the standards specified in the rule are observed. The Director will incorporate design and treatment standards into a permit or order. Design standards include a composite liner and a leachate collection system designed and constructed to maintain less than a 30 cm depth of leachate over the liner. A composite liner entails a system consisting of two components; each component has detailed specifications and installation requirements. The Director may approve alternate requirements if he can make the findings specified in the rule. Treatment standards are similar to LDR standards for contaminated soil, although alternative and adjusted standards may be approved or required by the Director, as long as the adjusted standard is protective of human health and the environment.

Table 10-1. Potential Action-Specific ARARs

Media and Citation	Description of Requirement	Potential ARAR Status	Standard
Prohibition of air pollution nuisances (e.g., fugitive dust) OAC Section 3745-15-07	These rules prohibit a release of nuisance air pollution that endangers health, safety, or welfare of the public or causes personal injury or property damage.	Applies to any activity that could result in the release of a nuisance air pollutant. This would include dust from excavation or soil management processes.	Any person undertaking an activity is prohibited from emitting nuisance air pollution.
Storm water requirements at construction sites 40 CFR Part 450	These rules require that storm water controls be employed at construction sites that exceed 1 acre in size.	Applies to any construction activity that exceeds 1 acre in total size.	Persons undertaking construction activities (including grubbing and land clearing) at an AOC where the construction footprint is over 1 acre in size must design and implement erosion and run-off controls.
Generation of contaminated soil or debris OAC Section 3745-52-11	These rules require that a generator determine whether a material generated is a hazardous waste.	Applies to any material that is or contains a solid waste. Must be characterized to determine whether the material is or contains a hazardous waste.	Generators of waste as defined must use prescribed methods to determine if waste is considered characteristically hazardous.
Management of contaminated soil or debris that is or contains a hazardous waste OAC Sections 3745-52-30 through -34	These rules require that hazardous waste be properly packaged, labeled, marked, and accumulated on-site pending on-site or off-site disposal.	Applies to any hazardous waste or media containing a hazardous waste that is generated from on-site activities.	All hazardous waste must be accumulated in a compliant manner that includes proper marking, labeling, and packaging of such waste in accordance with the specified regulations. This includes inspection of containers or container areas where hazardous waste is accumulated on-site.

Table 10-1. Potential Action-Specific ARARs (continued)

Media and Citation	Description of Requirement	Potential ARAR Status	Standard
Acquisition and use of manifests for hazardous waste shipments to off-site treatment, storage, or disposal facilities OAC Sections 3745-52-20 through -23	These rules require that a Uniform Hazardous Waste Manifest be used for any off-site shipment of hazardous waste.	Applies to any shipment of hazardous waste to an off-site facility for treatment, storage, or disposal.	Requires a generator who transports or offers for transportation hazardous waste for off-site treatment, storage, or disposal to prepare a uniform hazardous waste manifest.
Soil contaminated with RCRA hazardous waste OAC Section 3745-400-49 OAC Section 3745-400-48 UTS	These rules prohibit land disposal of RCRA hazardous waste subject to them, unless the waste is treated to meet certain standards that are protective of human health and the environment. Standards for treatment of hazardous waste-contaminated soil prior to disposal are set forth in the two cited rules. Use of the greater of either technology-based standards or UTS is prescribed.	LDRs apply only to RCRA hazardous waste. This rule is considered for ARAR status only upon generation of a RCRA hazardous waste. If any soil is determined to be RCRA hazardous, and if it will be disposed of on-site, this rule is potentially applicable to disposal of the soil.	All soil subject to treatment must be treated as follows: 1) For non-metals, treatment must achieve 90% reduction in total chemical concentration (primary chemical for which the waste is characteristically hazardous as well as for any organic or inorganic UHC), subject to 3 below. 2) For inorganic chemicals, carbon disulfide, cyclohexanone, and methanol, treatment must achieve 90% reduction in chemical concentrations as measured in leachate from the treated media (tested according to the TCLP) or 90% reduction in total chemical concentrations (when a inorganic chemical removal treatment technology is used), subject to 3 below.

Table 10-1. Potential Action-Specific ARARs (continued)

Media and Citation	Description of Requirement	Potential ARAR Status	Standard
			3) When treatment of any chemical subject to treatment to a 90% reduction standard would result in a concentration less than 10 times the UTS for that chemical, treatment to achieve chemical concentrations less than 10 times the UTS is not required. This is commonly referred to as "90% capped by 10xUTS."
Debris Contaminated with RCRA Hazardous Waste OAC Section 3745-400-49 OAC Section 3745-400-47	These rules prescribe conditions and standards for land disposal of debris contaminated with RCRA hazardous waste. Debris subject to this requirement for characteristic RCRA contamination that no longer exhibits the hazardous characteristic after treatment does not need to be disposed of as a hazardous waste. Debris contaminated with listed RCRA contamination remains subject to hazardous waste disposal requirements.	If RCRA hazardous debris is disposed of on-site, these rules are potentially applicable to disposal of the debris.	Standards are extraction or destruction methods prescribed in OAC Section 3745-400-47. Treatment residues continue to be subject to RCRA hazardous waste requirements.

Table 10-1. Potential Action-Specific ARARs (continued)

Media and Citation	Description of Requirement	Potential ARAR Status	Standard
Soil/Debris Contaminated with RCRA Hazardous Waste – Variance OAC Section 3745-400-44	The Director will recognize a variance approved by the USEPA from the alternative treatment standards for hazardous contaminated soil, or for hazardous debris.	Potentially applicable to RCRA hazardous soil, or debris that is generated and placed back into a unit and that will be land disposed of on-site.	A site-specific variance from the soil treatment standards can be used when treatment to concentrations of hazardous chemicals greater (i.e., higher) than those specified in the soil treatment standards minimizes short- and long-term threats to human health and the environment. In this way, on a case-by-case basis, risk-based LDR treatment standards approved through a variance process could supersede the soil treatment standards.

AOC = Area of Concern
ARAR = Applicable and Relevant or Appropriate Requirement
CAMU = Corrective Action Management Unit
CFR = Code of Federal Regulations
LDR = Land Disposal Restriction
MTR = Minimum Technical Requirement
OAC = Ohio Administrative Code
RCRA = Resource Conservation and Recovery Act
TCLP = Toxicity Characteristic Leaching Procedure
UHC = Underlying Hazardous Constituent
USEPA = U.S. Environmental Protection Agency
UTS = Universal Treatment Standard

.

10.2.3 Potential Location-Specific ARARs

Location requirements included those established for potential remedial activities conducted within wetlands or within a floodplain area or with respect to sensitive species and habitat. Generally, for wetlands and floodplains, rules require alternatives to remedial activity within the sensitive area be pursued; if that is not feasible, adverse effects from any actions taken within the sensitive area must be mitigated to the extent possible. These requirements do not relate to specific chemicals, nor do they further change the degree of cleanup in the sense of protecting human health or the environment from the effects of harmful substances. Rather, their purpose is to protect the sensitive areas to the extent possible. Under CERCLA Section 121(d), relevance and appropriateness are related to the circumstances presented by the release of hazardous substances, with the goal of attaining a degree of cleanup and control of further releases that ensures protection of human health and the environment. Within the area to be remediated, no sensitive resources (e.g., wetlands) or endangered species (including habitat) have been identified. As such, the requirements associated with such areas or species have not been identified as potential ARARs for the AOC. Due to the physical location of the AOC and identified site conditions, no location-specific ARARs have been identified for this action.

Any action taken by the Federal Government must be conducted in accordance with requirements established under the National Environmental Policy Act (NEPA), Endangered Species Act (ESA), National Historic Preservation Act, and federal and state wetlands and floodplains construction and placement of material considerations, even though these laws and rules do not establish standards, requirements, limitations, or criteria relating to the degree of cleanup for chemicals remaining on-site at the close of the response actions.

11.0 TECHNOLOGY TYPES AND PROCESS OPTIONS

This section identifies and describes the GRAs which may be implemented to achieve the remedial goals. In addition, this section summarizes the remedial technologies and process options available to remediate COCs in media identified in Section 9.0 of this report.

The procedure for identifying and screening potential remedial technologies followed the method established in the USEPA guidance document, *Guidance for Conducting Remedial Investigation/Feasibility Studies under CERCLA* (USEPA 1988). This guidance document provides the framework for identifying and screening all available remedial technologies to the most appropriate technologies available based on the COCs and AOC characteristics (e.g., soil type).

11.1 GENERAL RESPONSE ACTION

GRAs are actions which may be implemented to satisfy the RAO. The actions may be individual or a combination of responses. As shallow surface soil is the only media requiring remediation at this AOC, the following GRAs are applicable and are defined in greater detail in subsequent sections:

- No Action;
- Land use controls (LUCs)/five-year reviews;
- Removal;
- Treatment; and
- Disposal/handling.

11.1.1 No Action

No Action is required for evaluation under the NCP and is the baseline to which other remedial alternatives are compared. No Action may provide an appropriate alternative if no unacceptable risks are present at the AOC. This GRA provides a baseline against which to compare other, more proactive alternatives. No action is taken at the AOC to reduce any hazard to human health or the environment. Any existing actions, such as restrictions or monitoring, are discontinued.

11.1.2 Land Use Controls and Five-Year Reviews

LUCs are non-engineering measures, such as administrative or legal controls, used to prevent or limit exposure to hazardous substances. LUCs do not reduce contaminant volume or toxicity. LUCs are used to supplement engineering controls and are a necessary component of the final remedy.

If LUCs are selected as a component of a remedial alternative achieving National Guard Training Land Use, the effectiveness of the remedy must undergo five-year reviews. The primary goal of the five-year reviews is to evaluate the implementation and performance of the remedy to determine if the remedy is or will be protective of human health and the environment. The five-year reviews are discontinued when the remedy achieves CUGs for unrestricted release.

11.1.3 Removal

Removal of contaminated media from the AOC reduces or eliminates the potential for long-term human and environmental exposure to chemicals exceeding concentrations determined to be protective for a given land use. Removal of soil may be combined with a form of treatment prior to disposal off-site. Removed soil may also be shipped directly without treatment.

11.1.4 Treatment

Treatment is conducted either in-situ or ex-situ to reduce contaminant concentrations to acceptable levels. Common types of treatment include biological, chemical, physical, and thermal. Biological treatment involves using microbes to degrade contaminants. Chemical treatment processes add chemicals to react with contaminants to reduce their toxicity or mobility. Physical processes involve either physically binding the contaminants to reduce mobility or the potential for exposure (e.g., encapsulation), or extracting the contaminant(s) from a medium to reduce volumes. Thermal treatment such as incineration uses high temperatures to volatilize, decompose, or melt contaminants. For soil treated by ex-situ methods, the treatment may allow soil to be placed back into the excavation, or may be treated to reduce the chemical concentration or stabilize the soil prior to off-site disposal.

11.1.5 Disposal and Handling

Disposal and handling involve the final and permanent placement of waste material in a manner protective of human health and the environment. The impacted media is disposed on-site in an engineered facility, or off-site in a permitted or licensed facility, such as a regulated landfill. Similarly, concentrated waste resulting from treatment processes is disposed on-site in a permanent disposal cell or off-site in an approved disposal facility. Aqueous media is treated on-site and disposed off-site at a regulated facility.

Transportation is accomplished utilizing various methods, including truck, railcar, and/or barge.

11.2 INITIAL SCREENING OF TREATMENT TECHNOLOGIES

Table 11-1 summarizes the remedial technologies and process options available for the treatment of COCs in soil. The screening focuses on technology types capable of remediating the COCs present at the AOC and evaluates the implementability of the technology. If treatment technologies are evaluated and retained as potentially viable treatment options for the AOC, the technology will undergo a more detailed evaluation in the following section.

Table 11-1. Initial Screening of Technologies

General Response Actions	Technology Type	Process Options	Description	Screening Results
No Action	None	None	No action is taken at AOC. Current LUCs, access restrictions, and monitoring programs will be discontinued. No remedial technologies implemented to reduce hazards to potential human or ecological receptors.	Retained. Required to be carried through CERCLA analysis.
Institutional Controls	Access Restrictions	LUCs with CERCLA Five-Year Reviews	Implement LUCs at the AOC to restrict access and land use. LUCs will be administered and enforced as part of the Property Management Plan and reviewed in CERCLA Five-Year Reviews. Five-Year Reviews include review of sampling and monitoring plans, results of monitoring activities, interviews, inspections, and reviews of AOC status.	Not retained. A remedial alternative selected for arsenic within ATAss-005M will achieve an unrestricted scenario. Consequently, LUCs and Five-Year Reviews will not be a technology associated with any remedy.
		Fencing	Place fencing around areas of contamination (at a minimum) to restrict access and exposure to contamination left in place.	Not retained. Using a fence at this AOC will inhibit planned future military training activities.
Containment	Capping	Native Soil/Sediment	Uses native soil or sediment to cover contamination and reduce migration by wind and water erosion.	Not retained. Using a native soil/sediment cap in areas with contamination will inhibit planned future military training activities.
		Clay	Clay layers are used to cover contamination and eliminate exposure. Installation of clay cap to limit water infiltration. Susceptible to weathering effects (e.g., cracking)	Not retained. Using clay in areas with contamination will inhibit planned future military training activities.
		Synthetic Liner	A synthetic liner is used to cover contamination and limit exposure. Synthetic material used to limit water infiltration, not as susceptible to cracking as clay.	Not retained. Using a synthetic liner cap in areas with contamination will inhibit planned future military training activities.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Containment	Capping	Multi-Layered	Multiple layers of different soil types used to limit water infiltration, not as susceptible to cracking as clay.	Not retained. Using a multi-layered cap in areas with contamination will inhibit planned future military training activities.
		Asphalt/Concrete	Asphalt or concrete layers are used to cover contamination and limit exposure. Additionally, this technology limits water infiltration, susceptible to cracking if not properly maintained.	Not retained. Using an asphalt or concrete cap in areas with contamination will inhibit planned future military training activities.
Removal	Bulk Removal	Excavation and Off-Site Disposal	Contaminated material is removed and transported to permitted off-site treatment and disposal facilities.	Retained.
Treatment	In Situ Biological Treatment	Bioventing	Oxygen is delivered to contaminated unsaturated soil by forced air movement (either extraction or injection of air) to increase oxygen concentrations and stimulate biodegradation.	Not retained. Technology focuses on remediation of media contaminated with petroleum hydrocarbons, solvents, pesticides, and other organic chemicals. Not applicable for inorganic chemicals.
		Enhanced Bioremediation	Indigenous or inoculated micro-organisms (e.g., fungi, bacteria, and other microbes) degrade (metabolize) organic contaminants found in soil and/or groundwater, converting them to innocuous end products.	Not retained. Technology focuses on remediation of media contaminated with petroleum hydrocarbons, solvents, pesticides, and other organic chemicals. Not applicable for inorganic chemicals.
		Phytoremediation	The use of plants to remove, transfer, stabilize, and destroy contaminants in soil and sediment.	Retained.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	In Situ Physical/Chemical Treatment	Chemical Oxidation	Oxidation chemically converts hazardous contaminants to non-hazardous or less toxic compounds that are more stable, less mobile, and/or inert. The oxidizing agents most commonly used are ozone, hydrogen peroxide, hypochlorites, chlorine, and chlorine dioxide.	Not retained. At this time, it is assumed that the areas requiring remediation are not considered hazardous and, therefore, do not need reduction to less toxic compounds for cheaper disposal options.
		Electrokinetic Separation	Removal of inorganics and organic contaminants from low permeability soil, mud, sludge, and marine dredging. Electrokinetic remediation uses electrochemical and electrokinetic processes to desorb, and then remove, inorganic chemicals and polar organic chemicals.	Retained.
		Fracturing	Cracks are developed by fracturing beneath the surface in low permeability and over-consolidated sediment to open new passageways that increase the effectiveness of many in situ processes and enhance extraction efficiencies.	Retained.
		Soil Flushing	Water, or water containing an additive to enhance contaminant solubility, is applied to the soil or injected into the groundwater to raise the water table into the contaminated soil zone. Contaminants are leached into the groundwater, which is then extracted and treated.	Not retained. Although inorganic chemicals can be remediated by this technology, implementation of this technology will not be used since impacting groundwater at this AOC will not be acceptable. Groundwater is still undergoing investigation and determinations if groundwater contaminants exist have yet to be made. Impacting groundwater to treat soil or sediment will not be practical at this point in time.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	In Situ Physical/Chemical Treatment	Soil Vapor Extraction	Vacuum is applied through extraction wells to create a pressure/concentration gradient that induces gas-phase volatiles to be removed from soil through extraction wells. This technology is also known as in situ soil venting, in situ volatilization, enhanced volatilization, or soil vacuum extraction.	Not retained. Technology focuses on remediation of media contaminated with SVOCs, VOCs, and some fuels. Not applicable for inorganic chemicals.
		Solidification/Stabilization	Contaminants are physically bound or enclosed within a stabilized mass (solidification), or chemical reactions are induced between the stabilizing agent and contaminants to reduce their mobility (stabilization).	Retained.
	In Situ Thermal Treatment	Thermal Treatment	Steam/hot air injection or electrical resistance/electromagnetic/fiber optic/radio frequency heating is used to increase the volatilization rate of semi-volatiles and facilitate extraction.	Not retained. Technology focuses on remediation of media contaminated with SVOCs and VOCs. Not applicable for inorganic chemicals.
	Ex Situ Biological Treatment (assuming excavation)	Biopiles	Excavated soil is mixed with soil amendments and placed in aboveground enclosures. It is an aerated static pile composting process in which compost is formed into piles and aerated with blowers or vacuum pumps.	Not retained. Technology focuses on remediation of media contaminated with VOCs and fuel hydrocarbons. Not applicable for inorganic chemicals.
		Composting	Contaminated soil is excavated and mixed with bulking agents and organic amendments such as wood chips and animal and vegetative waste, which are added to enhance the porosity and organic content of the mixture to be decomposed.	Not retained. Technology focuses on remediation of media contaminated with SVOCs. Not applicable for inorganic chemicals.
		Landfarming	Contaminated soil, sediment, or sludge is excavated, applied into lined beds, and periodically turned over or tilled to aerate the waste.	Not retained. Technology focuses on remediation of media contaminated with petroleum hydrocarbons. Not applicable for inorganic chemicals.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	Ex Situ Biological Treatment (assuming excavation)	Slurry Phase Biological Treatment	Aqueous slurry is created by combining soil, sediment, or sludge with water and other additives. The slurry is mixed to keep solids suspended and microorganisms in contact with the soil contaminants. Upon completion of the process, the slurry is dewatered and the treated soil is disposed of.	Not retained. Technology has been successfully used to remediate soil, sludges, and sediment contaminated by explosives, petroleum hydrocarbons, petrochemicals, solvents, pesticides, wood preservatives, and other organic chemicals. Not applicable for inorganic chemicals.
	Ex Situ Physical/Chemical Treatment (assuming excavation)	Chemical Extraction	Waste-contaminated soil and extractant are mixed in an extractor, thereby dissolving the contaminants. The extracted solution is then placed in a separator, where the contaminants and extractant are separated for treatment and further use.	Not retained. Technology focuses remediation of media contaminated with PCBs, VOCs, halogenated solvents, and petroleum waste. Although the technology is considered suitable for inorganic chemicals, clay content (similar to RVAAP soil) reduces efficiency and traces of solvent may remain in treated media.
		Chemical Reduction/Oxidation	Reduction/oxidation chemically converts hazardous contaminants to non-hazardous or less toxic compounds that are more stable, less mobile, and/or inert. The oxidizing agents most commonly used are ozone, hydrogen peroxide, hypochlorites, chlorine, and chlorine dioxide.	Not retained. At this time, it is assumed that the areas requiring remediation are not considered hazardous and, therefore, do not need reduction to less toxic compounds for cheaper disposal options.
		Dehalogenation	Reagents are added to soil contaminated with halogenated organic chemicals. The dehalogenation process is achieved by either the replacement of the halogen molecules or the decomposition and partial volatilization of the contaminants.	Not retained. Technology focuses remediation of media contaminated with halogenated SVOCs and pesticides. Not applicable for inorganic chemicals.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment		Soil Washing	Contaminants sorbed onto fine soil particles are separated from bulk soil in an aqueous-based system on the basis of particle size. The wash water may be augmented with a basic leaching agent, surfactant, pH adjustment, or chelating agent to help remove organic chemicals and heavy metals.	Retained.
		Solidification/Stabilization	Contaminants are physically bound or enclosed within a stabilized mass (solidification), or chemical reactions are induced between the stabilizing agent and contaminants to reduce their mobility (stabilization).	Retained.
	Ex Situ Thermal Treatment (assuming excavation)	Hot Gas Decontamination	The process involves raising the temperature of the contaminated equipment or material for a specified period of time. The gas effluent from the material is treated in an afterburner system to destroy all volatilized contaminants.	Not retained. This technology is applicable for process equipment requiring decontamination for reuse. It is also applicable for explosive items, such as mines and shells, being demilitarized (after removal of explosives), or scrap material contaminated with explosives. Not applicable for inorganic chemicals.
		Incineration	High temperatures, 870-1,200 °C (1,600- 2,200 °F), are used to combust (in the presence of oxygen) organic chemicals in hazardous waste.	Not retained. Technology focuses remediation of media contaminated with explosives and hazardous waste, particularly chlorinated hydrocarbons, PCBs, and dioxins. Not applicable for inorganic chemicals.

Table 11-1. Initial Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Description	Screening Results
Treatment	Ex Situ Thermal Treatment (assuming excavation)	Pyrolysis	Chemical decomposition is induced in organic material by heat in the absence of oxygen. Organic material is transformed into gaseous components and a solid residue (coke) containing fixed carbon and ash.	Not retained. Technology focuses on remediation of media contaminated with SVOCs and pesticides. Not applicable for inorganic chemicals.
		Thermal Desorption	Waste is heated to volatilize water and organic contaminants. A carrier gas or vacuum system transports volatilized water and organic chemicals to the gas treatment system.	Not retained. Technology focuses on remediation of media contaminated with organic chemicals. Not applicable for inorganic chemicals.

AOC = Area of Concern
CERCLA = Comprehensive Environmental Response, Compensation, and Liability Act
LUC = Land Use Control
OB = Open Burn
OD = Open Detonation
PCB = Polychlorinated Biphenyl
RVAAP = Ravenna Army Ammunition Plant
SVOC = Semi-volatile Organic Compound
VOC = Volatile Organic Compound

11.3 DETAILED SCREENING OF TECHNOLOGIES

The remedial action technologies retained from the initial screening process are evaluated against criteria of effectiveness, implementability, and cost (three of the NCP balancing criteria). The rationale for either retaining or eliminating treatment options for the AOC is presented and summarized in Table 11-2. The remedial options retained from the detailed screening process develop the remedial alternatives presented in Section 12.0.

11.3.1 Effectiveness

The effectiveness criterion assesses the ability of a remedial technology to protect human health and the environment by reducing the toxicity, mobility, or volume of contaminants. Each technology is evaluated for the ability to achieve the RAO, potential impacts to human health and the environment during construction and implementation, and overall reliability of the technology.

11.3.2 Implementability

Each process option technology is evaluated for implementability in terms of technical feasibility, administrative feasibility, and availability of the necessary material, equipment, and work force. The assessment considers each technology's short- and long-term implementability. Short-term implementability considerations include constructability of the remedial technology, near-term reliability, the ability to obtain necessary approvals with other agencies, and the likelihood of obtaining a favorable community response. Long-term implementability evaluates the ease of undertaking additional remedial actions if necessary, monitoring the effectiveness of the remedy, and operation and maintenance (O&M).

11.3.3 Cost

The cost criterion evaluates each remedial process in terms of relative capital and O&M costs. Costs for each technology are rated qualitatively on the basis of engineering judgment, in terms of cost effectiveness. Therefore, a low cost remedial technology is rated as highly cost effective, while a costly technology is evaluated as being of low cost effectiveness.

Table 11-2. Detailed Screening of Technologies

General Response Actions	Technology Type	Process Options	Effectiveness	Implementability	Cost	Screening Comments
No Action	None	None	Not effective. Exposure to contaminants left in place goes unsupervised and uncontrolled.	Easy to implement. No activities are implemented.	Low cost. No activities driving cost.	Retained. Required by CERCLA
Removal	Bulk Removal	Excavation and Off-Site Disposal	Effective. Once the contaminated soil is removed, contaminant exposure to human health and the environment are eliminated.	Moderately easy to implement. Technology has been implemented at RVAAP in the past.	Moderate cost.	Retained.
Treatment	In Situ Biological Treatment	Phytoremediation	Moderate to low effectiveness. Phytoremediation is designed to address inorganic chemicals; however, the time required to remediate these chemicals is not practical given time constraints to transfer AOC to NGB.	Not easy to implement. The time required for phytoremediation to reduce inorganic chemicals in the soil is not practical given time constraints to transfer AOC to NGB. This technology is currently at the demonstration stage and not widely recognized by regulators. Additionally, concentrations can be hazardous to plants and may be mobilized into groundwater or bioaccumulated in animals.	Moderate cost. The cost effectiveness increases as the remedial footprint increases. The area requiring remediation is small; therefore, there is not optimal cost effectiveness.	Not Retained. The time required for phytoremediation to reduce inorganic chemicals in the soil is not practical given time constraints to transfer AOC to NGB.
	In Situ Physical/Chemical Treatment	Electrokinetic Separation	Moderate to low effectiveness. Maximum effectiveness occurs if the moisture content is 14-18%. Moisture content of soil is 22.5%.	Not easy to implement. Implementability challenges include additions of acids to soil being remediated. Use of this technology coupled with the risk of adding an additional concern to the environment make this technology not feasible.	High cost. Pilot study is required as few previous studies have been implemented. Pilot study and implementation costs are high relative to quantity of soil requiring remediation.	Not Retained. Although potentially effective, a pilot study is required to gauge effectiveness. The time required for electrokinetic separation to reduce inorganic chemicals in the soil is not practical given time constraints to transfer AOC to NGB.
		Fracturing	Moderate effectiveness. Effectiveness driven by effectiveness of other in situ treatment.	Moderate to implement. Fracturing of surface soil is easily achievable. However, fractures may close in non-clayey soil.	Moderate cost to high cost. Cost includes cost of other in situ technologies as this technology enhances other in situ technologies.	Not Retained. This technology is used in unison with other in situ technologies. Since no other in situ technologies are retained, this technology is also not retained.
		Solidification/Stabilization	Moderate effectiveness. Effectiveness is gauged by treatability study. Current concentration indicates soil is not hazardous, and a small reduction of contaminant concentrations from existing level to CUG is required.	Not easy to implement. Treatability studies are usually required to demonstrate effectiveness. Implementing a treatability study is not practical given time constraints to transfer AOC to NGB.	High cost. Pilot study is required as few previous studies have been implemented. Pilot study and implementation costs are high relative to quantity of soil requiring remediation.	Not Retained. Although potentially effective, a pilot study is required to gauge effectiveness. The time required for Solidification/ Stabilization to reduce inorganic chemicals in the soil is not practical given time constraints to transfer AOC to NGB.

Table 11-2. Detailed Screening of Technologies (continued)

General Response Actions	Technology Type	Process Options	Effectiveness	Implementability	Cost	Screening Comments
Treatment	Ex Situ Physical/Chemical Treatment (assuming excavation)	Soil Washing	Moderate effectiveness. Soil washing is more effective reducing soil with high concentrations of contaminants (e.g., hazardous waste levels). It is assumed that the soil is not hazardous waste and only a small reduction is required to achieve CUGs.	Not easy to implement. Treatability study may be required to demonstrate effectiveness. Implementing a treatability study is not practical given time constraints to transfer the AOC to NGB. Additionally, an additional treatment step of the washing solvent (potentially a hazardous waste) will be required.	High cost. Soil washing is cost effective with high quantities. However, a relatively low quantity of soil requires remediation.	Not Retained. A treatability study hinders schedule to achieve the U.S. Army's goal for completion. Additionally, the quantity of soil requiring remediation does not result in cost efficiency for this technology.
		Solidification/Stabilization	Moderate effectiveness. The material is not considered hazardous, and there is only a small reduction in chemical concentration to achieve CUGs.	Not easy to implement. Treatability studies are usually required to demonstrate effectiveness. Implementing a treatability study is not practical given time constraints to transfer the AOC to NGB.	High cost. Increase in disposal volume as a result of adding solidifying or stabilizing agent.	Not Retained. The material is assumed not to be hazardous and will require small reduction in chemical concentrations to CUGs. It is impractical to solidify or stabilize to make a small change in concentration.

AOC = Area of Concern
CERCLA = Comprehensive Environmental Response, Compensation, and Liability Act
CUG = Cleanup Goal
NGB = National Guard Bureau
RVAAP = Ravenna Army Ammunition Plant

12.0 DEVELOPMENT OF REMEDIAL ALTERNATIVES

This section describes the remedial alternatives developed using the GRAs, technology types, and process options presented in Section 11.0. The retained remedial alternatives meet GRAs and are composed of implementable technology types and process options that address COCs in soil at Anchor Test Area.

The retained remedial alternatives are:

- Alternative 1: No Action; and
- Alternative 2: Attain National Guard Training and Residential Land Uses.

A detailed description of each remedial alternative is provided in the following sections.

12.1 ALTERNATIVE 1: NO ACTION

The No Action alternative is required for evaluation under the NCP. This alternative is the baseline to which other remedial alternatives are compared. This alternative assumes all current actions (e.g., access restrictions and environmental monitoring) are discontinued and assumes no future actions take place to protect human receptors or the environment. Removal or treatment of COCs at the AOC is not implemented.

12.2 ALTERNATIVE 2: ATTAIN NATIONAL GUARD TRAINING AND RESIDENTIAL LAND USES

Actions for each media within this AOC for this alternative are as follows:

- Shallow Surface Soil (0-1 ft bgs) – Excavation with Off-site Disposal
- Deep Surface Soil (1-4 ft bgs) – NFA
- Subsurface Soil (1-13 ft bgs) – NFA

Implementing shallow surface soil removal in contaminated areas at this AOC is necessary to attain National Guard Trainee and Resident Farmer CUGs, which is the objective of Alternative 2. As stated in previous sections, there are no COCs in deep surface soil or subsurface soil for National Guard Trainee and Resident Farmer receptors; therefore, NFA is required for these media. Surface water and sediment does not exist at the AOC. Alternative 2 consists of excavating shallow surface soil, with transportation by truck to an off-site licensed disposal facility to achieve CUGs for both the Resident Farmer and the National Guard Trainee receptors.

This alternative requires soil removal at sampling location ATAss-005M. The extent of the excavation is depicted on Figure 9-1. The estimated total disposal volume (i.e., ex situ) is approximately 14 yd^3. This extent and total disposal volume assumes ISM confirmatory sampling does not result in further soil removal after the initial excavation to 1 ft bgs in sample location ATAss-005M.

This remedial alternative requires coordination of remediation activities with the Ohio EPA, OHARNG, and U.S. Army. Coordinating with stakeholders during implementation of the excavation minimizes health and safety risks to on-site personnel and potential disruptions of RVAAP activities. The time period to complete this remedial action is relatively short and does not include an O&M period to assess impacts from soil. Components of this remedial alternative include:

- Notifications and approvals;
- Remedial Design (RD);
- Waste characterization sampling;
- Site setup, soil excavation, and waste disposal;
- Confirmatory sampling; and
- Restoration.

12.2.1 Notifications and Approvals

Prior to the implementation of this remedial alternative, a review will be conducted to identify any required notifications and approvals. This includes (but is not limited to) obtaining concurrence from the U.S. Fish and Wildlife Service and Ohio Historic Preservation Office.

12.2.2 Remedial Design

An RD plan will be developed prior to the initiation of remedial actions. This plan will outline construction notification requirements; site preparation activities (e.g., staging and equipment storage areas, truck routes, storm water controls); the extent of the excavation; sequence of construction activities; decontamination; and segregation, transportation, and disposal of various waste streams. Engineering and administrative controls (e.g., erosion controls, health and safety controls) will be developed during the active construction period to ensure remediation workers and the environment are protected.

12.2.3 Waste Characterization Sampling

Waste characterization samples will be collected from the area requiring removal. The waste characterization samples will be collected as ISM samples from the area(s) undergoing this remedy to provide the waste disposal facility data to properly profile the waste and determine if it is characteristically nonhazardous or hazardous. Each ISM sample analysis may include (but is not limited to) TCLP metals, TCLP SVOCs, TCLP Pesticides, TCLP Herbicides, Reactive Cyanide, Reactive Sulfide, and PCBs.

12.2.4 Site Setup, Soil Excavation, and Waste Disposal

Prior to any ground disturbance, erosion control material such as silt fences and straw bales will be installed to minimize sediment runoff. Dust generation will be minimized during excavation activities by keeping equipment movement areas and excavation areas misted with water. The health and safety of remediation workers, on-site RVAAP employees, and the general public will be covered in a site-specific health and safety plan.

To achieve a scenario in which the AOC is protective for use by the National Guard Trainee and the Resident Farmer, soil will be removed from location ATAss-005M. Field reconnaissance and surveying will be performed to locate the extents of location ATAss-005M. The extent of this location will be staked to provide guidance to workers executing soil removal. Soil removal will be accomplished using conventional construction equipment such as backhoes, bulldozers, front-end loaders, and scrapers. Oversize debris will be crushed or otherwise processed to meet disposal facility requirements.

Excavated soil will be hauled by truck to a licensed and permitted disposal facility. All trucks will be inspected prior to exiting the AOC. Appropriate waste manifests will accompany each waste shipment. Only regulated and licensed transporters and vehicles will be used. All trucks will travel pre-designated routes within RVAAP.

Excavated soil will be disposed at an existing off-site facility licensed and permitted to accept the characterized waste stream. The selection of an appropriate facility will consider the types of waste, location, transportation options, and cost. Waste streams with different chemicals and/or characteristics may be generated. Disposal cost savings will be possible by utilizing specific disposal facilities for different waste streams.

At the end of the soil excavation, confirmatory samples will be collected from excavation sidewalls unless the excavation sidewalls coincide with previously sampled locations deemed not to require remedy.

12.2.5 Confirmatory Sampling

If necessary, field staff will collect confirmatory ISM samples from excavation sidewalls. Excavation will be to at least 1 ft bgs; therefore, samples of the excavation floor are not required. The confirmation samples will be sent to an off-site laboratory to be analyzed for the COC concentration. If the analyses indicate the COC concentration in soil exceeds the CUGs, further excavation will be conducted. If confirmation sample results are less than CUGs, further soil removal will not be required, and the area can be restored.

12.2.6 Restoration

Once it is determined additional excavation is not required, all disturbed and excavated areas will be backfilled with clean soil and graded to meet neighboring contours. The backfill will come from a source that was previously sampled and approved for use by Ohio EPA. After the area is backfilled and graded, workers will apply a seed mixture (as approved by OHARNG) and mulch. Restored areas will be inspected and monitored as required in the Storm Water Pollution Prevention Plan (SWPPP).

13.0 ANALYSIS OF REMEDIAL ALTERNATIVES

13.1 INTRODUCTION

This section presents a detailed analysis of the viable remedial alternatives retained and developed through the technology screening process. The purpose of this detailed analysis is to provide stakeholders ample information to identify and select an appropriate remedy and prepare the PP. Based on this detailed analysis of the retained alternatives, one or more is recommended for media requiring remediation at Anchor Test Area.

The remedy must meet the following four statutory requirements:

- Be protective of human health and the environment;
- Comply with ARARs (or justification for a waiver);
- Be cost effective; and
- Use permanent solutions and treatment or recovery technologies to the maximum extent practicable.

There are nine established NCP evaluation criteria used to perform a detailed analysis of remedial alternatives to ensure the selected alternative meets the above CECRLA statutory requirements. The nine criteria are grouped into three categories: threshold criteria, balancing criteria, and modifying criteria.

13.1.1 Threshold Criteria

There are two evaluation criteria classified as threshold criteria. This criteria group relates directly to statutory findings. Threshold criteria must be met by the selected remedy. The evaluation criteria in this group are:

1. Overall protection of human health and the environment; and
2. Compliance with ARARs.

Each alternative must be evaluated to determine how it achieves and maintains protection of human health and the environment. An alternative is considered to be protective of human health and the environment if it achieves CUGs. Similarly, the evaluation determines if each remedial alternative complies with ARARs, or if a waiver is required. If a waiver is appropriate, the evaluation must include a justification.

13.1.2 Balancing Criteria

There are five evaluation criteria classified as balancing criteria. This group represents the primary criteria upon which the detailed and comparative analysis of each remedial alternative are based. The evaluation criteria in this group are:

1. Long-term effectiveness and permanence;
2. Reduction of toxicity, mobility, or volume through treatment;
3. Short-term effectiveness;
4. Implementability; and
5. Cost.

Long-term effectiveness and permanence is an evaluation of the magnitude of residual risk (risk remaining after implementation of the alternative) and the adequacy and reliability of controls used to manage the remaining waste (untreated waste and treatment residuals) over the long term. Alternatives that provide the highest degree of long-term effectiveness and permanence leave little or no untreated waste at the AOC, make long-term maintenance and monitoring unnecessary, and minimize the need for LUCs.

Reduction of toxicity, mobility, or volume through treatment is an evaluation of the ability of the alternative to reduce the toxicity, mobility, or volume of the waste. The irreversibility of the treatment process and the type and quantity of residuals remaining after treatment are also assessed.

Short-term effectiveness addresses the protection of workers and the community during the remedial action, the environmental effects of implementing the action, and the time required to achieve media-specific preliminary CUGs.

Implementability addresses the technical and administrative feasibility of implementing an alternative and the availability of various services and material required during implementation. Technical feasibility assesses the ability to construct and operate a technology, the reliability of the technology, the ease in undertaking additional remedial actions, and the ability to monitor the effectiveness of the alternative. Administrative feasibility is addressed in terms of the ability to obtain approval from federal, state, and local agencies.

Cost analyses provide an estimate of the dollar cost of each alternative. The cost estimates in this report are based on estimating reference manuals, historical costs, vendor quotes, and engineering estimates. Costs are reported in base year 2010 dollars, or present value (future costs are converted to base year 2010 dollars using a 4.125% discount factor). The present value analysis is a method to evaluate expenditures, either capital or O&M, which occur over different time periods. Present value calculations allow for cost comparisons of different remedial alternatives on the basis of a single cost figure. The capital costs have not been discounted due to their relatively short implementation duration. The cost estimates are for guidance in project evaluation and implementation and are believed to be accurate within a range of -30% to +50% in accordance with USEPA guidance

(USEPA 1988). Actual costs could be higher than estimated due to unexpected conditions or potential delays. Details and assumptions used in developing cost estimates for each of the alternatives are provided in Appendix I.

13.1.3 Modifying Criteria

There are two evaluation criteria categorized as modifying criteria. Modifying criteria are formally evaluated as part of the ROD and after the public has had an opportunity to comment on the PP. This criteria group consists of:

1. State acceptance; and
2. Community acceptance.

State Acceptance considers comments received from agencies of the State of Ohio. Ohio EPA is the primary state agency supporting this investigation. Ohio EPA, as well as other state agencies, will provide comments on the FS and the preferred remedy presented in the PP. This criterion is addressed in the responsiveness summary of the ROD.

Community Acceptance considers comments made by the community, including stakeholders, on the alternatives being considered. Comments will be solicited and accepted from the community on the FS and the preferred remedy presented in the PP. This criterion is addressed in the responsiveness summary of the ROD.

Modifying criteria are future activities. These actions are the same for the retained alternatives. Therefore, the detailed analysis of the remedial alternatives is not included in an evaluation of modifying criteria. The detailed analysis of the retained remedial alternatives for Anchor Test Area is presented in the following sections. This analysis is based on seven evaluation criteria (two threshold and five balancing criteria).

13.2 DETAILED ANALYSIS OF REMEDIAL ALTERNATIVES

A detailed analysis of each alternative against the seven NCP evaluation criteria is contained in the following sections and is summarized in Table 13-1. The detailed analysis includes further definition of each alternative (if necessary), compares the alternatives against one another, and presents considerations common to the alternatives.

As presented in Section 12.0, the following remedial alternatives were retained for Anchor Test Area:

- Alternative 1: No Action; and
- Alternative 2: Attain National Guard Training and Residential Land Uses.

13.2.1 Alternative 1: No Action

Under this alternative, no remedial actions take place for any media to meet the RAO. Media with concentrations greater than CUGs are left in place. Existing access restrictions (e.g., RVAAP perimeter fence) are not continued. Environmental monitoring is not performed and no restrictions on land use are implemented.

13.2.1.1 Overall Protection of Human Health and the Environment

Alternative 1 is not protective of human health for the RAFLU (National Guard Training) and Residential Land Use. Arsenic is identified as a COC in ISM shallow surface soil (0-1 ft bgs) samples for both the National Guard Trainee and Resident Farmer scenarios. Alternative 1 is not considered protective of human health for the representative receptor (National Guard Trainee).

The ERA concluded there is chemical contamination and possible risk but no important or significant ecological resources at the 0.5 acres of Anchor Test Area, and the recommendation is NFA for protection of ecological resources (Section 7.3). Under Alternative 1, current risk is not reduced and the ecological resources at the AOC remains unchanged. Current land use and RAFLU allows for sustainability of terrestrial habitat for ecological receptors.

13.2.1.2 Compliance with ARARs

Potential ARARs for remediation of soil at Anchor Test Area are presented in Section 10.0. These enforceable standards are protective of representative receptors under both the National Guard Trainee and Resident Farmer Land Uses that are exposed to COCs at Anchor Test Area. There are no chemical-specific, location-specific, and action-specific ARARs identified for Alternative 1.

13.2.1.3 Long-Term Effectiveness and Permanence

Alternative 1 has no long-term management measures to prevent exposures to, or the migration of, COCs. Existing security is discontinued, and there is no access control to Anchor Test Area.

13.2.1.4 Reduction of Toxicity, Mobility, or Volume through Treatment

Alternative 1 does not reduce the toxicity, mobility, or volume of COCs. The alternative does not remove or treat soil with concentrations of COCs above CUGs.

13.2.1.5 Short-Term Effectiveness

Alternative 1 has no additional short-term health risks to the community, remediation workers, or the environment. This remedial alternative offers no short-term benefits or progress to achieve the RAO.

13.2.1.6 Implementability

This alternative does not require any additional effort to implement since it does not change the existing condition at Anchor Test Area.

13.2.1.7 Cost

The present value cost to complete Alternative 1 is $0. No capital costs are associated with this alternative.

13.2.2 Alternative 2: Attain National Guard Training and Residential Land Uses

The implementation of Alternative 2 results in Anchor Test Area achieving CUGs for the National Guard Trainee and Resident Farmer. To achieve these CUGs, Alternative 2 implements excavation and off-site disposal of shallow surface soil with concentrations greater than National Guard Trainee and Residential Farmer CUGs. An estimated 14 yd^3 (ex situ) of soil is excavated and transported (via truck) to an off-site permitted disposal facility. Other technologies required include monitoring, short-term containment, and waste handling via trucks.

13.2.2.1 Overall Protection of Human Health and the Environment

The long-term protectiveness of Alternative 2 is high. Surface soil with concentrations greater than the National Guard Trainee and Resident Farmer CUGs is excavated and removed from the AOC. The remedial action is protective of human health.

The ERA concluded there is contamination and risk but no important or significant ecological resources at Anchor Test Area, and the recommendation is NFA for protection of ecological resources (Section 7.3). However, this alternative beneficially reduces existing chemical risks to ecological receptors through removal of soil to attain human health CUGs. Implementation of Alternative 2 results in temporary vegetation loss and disruption of soil adjacent to excavation areas. Excavation of soil in the vicinity of Anchor Test Area disrupts approximately 5,184 ft^2 (0.12 acres) of the clearing area. The clearing area should recover from excavation activities in a few years.

13.2.2.2 Compliance with ARARs

These enforceable standards would be incorporated into planning and design documents and are protective of representative receptors National Guard Training and Residential Land Uses. Through incorporation into the planning and design documents and implementation during field activities, this action will comply with the identified ARARs.

13.2.2.3 Long-Term Effectiveness and Permanence

Alternative 2 effectively reduces and controls COCs in the soil over the long-term. Shallow surface soil above the National Guard Trainee and Resident Farmer CUGs is excavated and transported to an off-site disposal facility, thereby mitigating risks to human health and the environment. Accordingly, LUCs are not required at the completion of the removal activities. No CERCLA five-year reviews or O&M sampling are required.

13.2.2.4 Reduction of Toxicity, Mobility, or Volume through Treatment

Alternative 2 does not achieve a reduction in the toxicity or volume of contaminated media. The mobility of COCs in the excavated soil is reduced at the off-site disposal facility through engineering controls (e.g., clay liners, geomembranes).

13.2.2.5 Short-Term Effectiveness

There are potential short-term worker and community exposures associated with Alternative 2. Workers are exposed during the excavation activities. A health and safety plan that identifies appropriate personal protective equipment (PPE) for workers minimizes and/or eliminates exposures.

The community near the excavation area and along the route to the disposal facility can be exposed during removal and transportation activities. Mitigation measures during excavation, such as erosion and dust control, minimize/eliminate potential short-term impacts. The community will be protected during soil transport by inspecting vehicles before and after use, decontaminating as needed, covering the transported waste, observing safety protocols, following pre-designated routes, and limiting the distance to the disposal facility. Transportation risks associated with material leaks increase with distance and volume of material. Transportation of soil to an off-site disposal facility complies with all applicable state and federal regulations. Pre-designated travel routes are established and an emergency response program is developed to facilitate any potential accident response.

The excavation of the soil and restoration of the AOC is estimated to be completed in approximately one month. Storm water controls are monitored weekly for six months or until the vegetation is 70% established. Upon the completion of the excavation activities, Anchor Test Area is released for National Guard Training and Residential Land Uses.

13.2.2.6 Implementability

Alternative 2 is easily implemented after the development of a RD and all appropriate coordination with local, state, and federal agencies is completed. Excavation of soil, construction of temporary roads, and waste handling are conventional, straightforward construction techniques and methods. Multiple off-site disposal facilities are available to accept generated waste. Resources (e.g., equipment, material, trained personnel) to implement this alternative are readily available.

Excavation activities are coordinated with RVAAP and OHARNG to minimize disruptions and/or impacts to OHARNG. The RD identifies access routes to the AOC for heavy equipment and steps to minimize potential hazards to on-site personnel. The development of the RD and coordination with local, state, and federal permitting organizations increases the implementation difficulty of Alternative 2 as compared to Alternative 1.

13.2.2.7 Cost

The present value cost to complete Alternative 2 is approximately $93,967 (in base year 2010 dollars with a 4.125% discount factor). This alternative does not include an O&M period subsequent to the soil removal. See Appendix I for a detailed description of Alternative 2 costs.

13.3 COMPARATIVE ANALYSIS OF REMEDIAL ALTERNATIVES USING NCP CRITERIA

In this section, a comparative analysis of the alternatives is conducted to identify relative advantages and disadvantages of each based on the detailed analysis above. The comparative analysis provides a means by which remedial alternatives can be directly compared to one another with respect to common criteria. Overall protection and compliance with ARARs are threshold criteria that must be met by any alternative to be eligible for selection. The other criteria, consisting of short- and long-term effectiveness; reduction of contaminant toxicity, mobility, or volume through treatment; ease of implementation; and cost are the primary balancing criteria used to select a preferred remedy among alternatives that satisfies the threshold criteria. A summary table illustrating the comparative analysis is provided in Table 13-1.

The following remedial alternatives were retained and analyzed in detail:

Alternative 1: No Action;
Alternative 2: Attain National Guard Training and Residential Land Uses.

The relative advantage and disadvantages of these alternatives are described below. For these evaluations, the term “high” indicates a highly favorable situation, “medium” indicates a moderately favorable situation, and “low” indicates a situation that is not favorable.

13.3.1 Overall Protection of Human Health and the Environment

Alternative 1 does not provide overall protection of human health, as COCs for the National Guard Trainee and Resident Farmer remain on-site. Human health COCs remain in soil, and the current risk to ecological receptors and ecological significance of the AOC remains unchanged.

Alternative 2 provides protection of human health through removal of contamination and does not require additional protectiveness after contaminant removal, as the alternative achieves cleanup standards for the National Guard Trainee and Resident Farmer. Alternative 2 beneficially reduces

exposure and risk to ecological receptors to COCs but increases physical risk and will temporarily change the vegetation type of some terrestrial habitat.

13.3.2 Compliance with ARARs

All alternatives are considered to be in compliance with ARARs. There are no chemical-specific or location-specific ARARs for any of the alternatives. Action-specific alternatives are applicable to Alternative 2.

13.3.3 Long-Term Effectiveness and Permanence

Alternative 1 is rated low in terms of long-term effectiveness in preventing exposures or the spread of contamination. Alternative 1 does not involve any remedial action or LUCs for potential future exposure.

The long-term effectiveness and permanence of Alternative 2 is considered high. This alternative is highly permanent and effective since this alternative involves the removal of soil containing COCs and achievement of the National Guard Trainee and Resident Farmer CUGs. No LUCs are required after implementation of Alternative 2.

13.3.4 Reduction in Contaminant Volume, Toxicity, and Mobility through Treatment

The ability of Alternatives 1 and 2 to reduce COC volume and toxicity is low since these alternatives do not involve treatment. The mobility of COCs is reduced for Alternative 2, given the excavated soil is disposed of at an off-site facility equipped with engineering controls. Because Alternative 1 does not reduce mobility it is rated low. Alternative 2 is rated medium.

13.3.5 Short-Term Effectiveness

There are no additional short-term risks posed to the community, remedial workers, or the environment with Alternative 1. Therefore the short-term effectiveness of this remedial alternative is rated high.

Alternative 2 presents short-term risk to workers, the community, and the environment during excavation and transportation of soil. Mitigation measures (e.g., dust control, storm water controls, housekeeping activities, covering and cleaning haul trucks) during excavation activities minimize and/or eliminate all potential risks. The RAO is achieved within 30 days of implementation. Excavation results in a temporary loss of vegetated habitat. Short-term environmental impacts are minimized through construction mitigation techniques. Alternative 2 is rated medium for short-term effectiveness.

13.3.6 Implementability

All alternatives are considered implementable on a technical and availability-of-services basis. Alternative 1 as a "No Action" alternative is rated high. Soil removal and disposal should be readily implementable, but not as easily as Alternative 1. Therefore, Alternative 2 is assigned a medium rating.

13.3.7 Cost

Costs were estimated for comparison purposes only and are believed accurate within a range of -30% to +50%. The estimated present value cost (in base year 2010 dollars with a 4.125% discount factor) to complete each of the alternatives is as follows:

Alternative 1:	$	0
Alternative 2:	$	93,967

Table 13-1. Summary of Comparative Analysis of Remedial Alternatives

NCP Evaluation Criteria	**Alternative 1: No Action**		**Alternative 2: Attain National Guard Training and Residential Land Uses**	
Threshold Criteria	***Result***		***Result***	
1. Overall Protectiveness of Human Health and the Environment	Not protective		Protective	
2. Compliance with ARARs	Compliant		Compliant	
Balancing Criteria	***Ranking***	***Score***	***Ranking***	***Score***
3. Long-Term Effectiveness and Permanence	Low	1	High	3
4. Reduction of Toxicity, Mobility, or Volume through Treatment	Low	1	Medium	2
5. Short-Term Effectiveness	High	3	Medium	2
6. Implementability	High	3	Medium	2
7. Cost	High	3	Medium	2
Balancing Criteria Score		*11*		*11*

"High" = highly favorable situation
"Medium" = moderately favorable situation
"Low" = situation that is not favorable
Scoring for the Balancing Criteria is as follows: High = 3, Medium = 2, Low = 1
ARAR = Applicable or Relevant and Appropriate Requirements
NCP = National Contingency Plan

THIS PAGE INTENTIONALLY LEFT BLANK.

14.0 AGENCY COORDINATION AND PUBLIC INVOLVEMENT

The U.S. Army is the lead agency responsible for executing the CERCLA process and ultimately completing an approved ROD for soil, sediment, and surface water at Anchor Test Area. This section reviews actions that have been conducted and presents activities that are planned to ensure the regulatory agencies and members of the public have been provided with appropriate opportunities to stay informed of the progress of the Anchor Test Area environmental investigation, restoration efforts, and final selection of a remedy.

As described in Section 13.0, two of the nine NCP evaluation criteria are known as "modifying criteria" – state acceptance and community acceptance. These criteria provide a framework for obtaining the necessary agency coordination and public involvement in the remedy selection process.

14.1 STATE ACCEPTANCE

State acceptance considers comments received from agencies of the State of Ohio on the proposed remedial alternatives. Ohio EPA is the lead regulatory agency for supporting remedy of soil, sediment, and surface water at Anchor Test Area. This RI/FS report has been prepared in consultation with the Ohio EPA.

Ohio EPA has provided input during the ongoing investigation and report development to ensure the remedy ultimately selected for Anchor Test Area is protective of human health and the environment and fulfills the requirements of the DFFO (Ohio EPA 2004). Ohio EPA provided comments on this RI/FS report and will provide comments on the subsequent PP and ROD. The U.S. Army will obtain Ohio EPA concurrence prior to the final selection of the remedy for soil, sediment, and surface water at the AOC.

14.2 COMMUNITY ACCEPTANCE

Community acceptance considers comments provided by community members for each proposed remedial alternative. CERCLA 42 U.S.C. 9617(a) emphasizes early, constant, and responsive community relations. The U.S. Army has prepared a *Community Relations Plan* (USACE 2003b) to facilitate communication between RVAAP and the community surrounding Ravenna, Ohio during environmental investigations and potential remedial action. The plan was developed to ensure the public has convenient access to information regarding project progress. The community relations program interacts with the public through news releases, public meetings, public workshops, and Restoration Advisory Board (RAB) meetings with local officials, interest groups, and the general public.

CERCLA 42 U.S.C. 9617(a) requires an Administrative Record to be established "at or near the facility at issue." Relevant documents regarding RVAAP have been made available to the public for review and comment. The Administrative Record for this project is available at the following location:

Ravenna Army Ammunition Plant
Building 1037
8451 State Route 5
Ravenna, Ohio 44266-9297

Access to RVAAP is restricted but can be obtained by contacting facility management at (330) 358-7311. In addition, an Information Repository of current information and final documents is available to any interested reader at the following libraries:

Reed Memorial Library
167 East Main Street
Ravenna, Ohio 44266

Newton Falls Public Library
204 South Canal Street
Newton Falls, Ohio 44444-1694

Additionally, RVAAP has an online resource for restoration news and information. This website is available at: www.rvaap.org.

Comments will be received from the community upon issuance of the FS and the PP. As required by the CERCLA regulatory process and the RVAAP *Community Relations Plan*, the U.S. Army will hold a public meeting and request public comments on the PP for Anchor Test Area. These comments will be considered prior to the final selection of a remedy. Responses to these comments will be addressed in the responsiveness summary of the ROD.

15.0 CONCLUSIONS AND RECOMMENDED ALTERNATIVE

15.1 CONCLUSIONS

The primary purposes of this RI/FS report are to review of the history of Anchor Test Area, summarize RI activities, evaluate results of the RI, develop the RAO and remedial alternatives, and present a recommended alternative to address soil at the AOC.

The RAO for this AOC is to prevent: (1) National Guard Trainee exposure to identified COCs in soil above CUGs; (2) adverse ecological effects from previous AOC activities; and (3) negative groundwater impacts from contaminant migration.

Sediment and surface water do not exist at this AOC. Analyses of remedial alternatives are not warranted for subsurface soil greater than 1 ft depth based on the absence of human health COCs; NFA is recommended for this media. Soil remediation to protect groundwater is not warranted because: (1) contaminant leaching and fate and transport modeling results did not identify CMCOCs; and (2) groundwater has a depth greater than 5 ft bgs and is not considered an exposure medium to ecological receptors. Additionally, the ERA concluded there may be potential ecological risk but did not identify affected ecological resources associated with Anchor Test Area. As a result, the ERA recommended NFA for ecological resources.

To achieve National Guard Training and Residential Land Uses, remediation of COCs in shallow surface soil (0-1 ft bgs) is required. Chemical-specific CUGs are established. A combination of the National Guard Trainee and Resident Farmer CUGs provide a baseline for evaluating whether this AOC may be eligible for unrestricted release.

After the identification of COCs and the establishment of CUGs, remedial technologies are screened and the following viable remedial alternatives developed:

Alternative 1: No Action; and
Alternative 2: Attain National Guard Training and Residential Land Uses.

These alternatives are applicable and are compared against one another to provide information of sufficient quality and quantity to justify the selection of a remedy. The following section provides the recommended alternative for Anchor Test Area soil.

15.2 RECOMMENDED ALTERNATIVE

The recommended alternative for Anchor Test Area is Alternative 2: Attain National Guard Training and Residential Land Uses. This alternative attains CUGs for the National Guard Trainee and Resident Farmer, which provides the requisite level of protectiveness for unrestricted land use. A No Action alternative was also evaluated. However, since the threshold criteria Overall Protectiveness of

Human Health and the Environment is not protective, the No Action alternative is eliminated from consideration.

Alternative 2 involves the removal of shallow surface soil (0-1 ft bgs) at Anchor Test Area that exceeds the arsenic CUG (15.4 mg/kg) for the Resident Farmer at location ATAss-005M. Confirmation samples will be collected along excavation sidewalls using ISM to verify the extent of excavation is below the CUG or if further lateral removal of soil is required. If the excavation extends to a previously sampled ISM sampling area that had a concentration less than the CUG (e.g., ATAss-016M), excavation will stop and confirmation sampling on the corresponding sidewall will not be required.

Assuming removal beyond the extent of the ATAss-005M is not needed, the cost for the alternative is estimated to be $93,967. Successful implementation of the alternative at the AOC will attain a requisite level of protectiveness for soil for unrestricted land use. Therefore, LUCs and five-year reviews will not be required following the remedy.

The next step in the CERCLA process is to prepare a PP to solicit public input on the remedial alternatives. The PP will present these alternatives with the preferred remedial alternative for Anchor Test Area. Comments on the PP provided by state and federal agencies and the public will be presented in the Responsive Summary Section of the Anchor Test Area ROD. The ROD will provide a brief summary of the history, characteristics, and risks of the AOC, and will document its selected remedy.

ASBESTOS VISUAL INSPECTION REPORT

THIS PAGE INTENTIONALLY LEFT BLANK.

ASBESTOS VISUAL INSPECTION REPORT

AREA OF CONCERN: ANCHOR TEST AREA

DATE INSPECTED (MM/DD/YY): 09-26-11 TIME: 1131 - 1200

FIELD OBSERVATIONS ~ description of ACM identified found (if any), initial determination if ACM is friable, approximate location of ACM. If no ACM is identified at the AOC, please note in this section:

Large mound on map. Unknown content
Needs further characterization
No visably discernable asbestos material noted.

Heavy shrubs, grass, and vegetation throughout area, obsuring visible inspection of the ground. Former roads, buildings, and walk-ways partially to completely overgrown

INITIAL CORRECT LINE(S)

KRB I HAVE PERFORMED A VISUAL INSPECTION OF LOCATIONS BELIEVED TO POTENTIALLY HAVE ASBESTOS CONTAINING MATERIAL WITHIN THE AREA OF CONCERN. IN THOSE LOCATIONS, THERE WAS NO VISABLY DISCERNABLE ASBESTOS CONTAINING MATERIAL.

_____ I HAVE VISUALY INSPECTED THE RVAAP AOC AND DID NOT IDENTIFY ANY INDICATIONS THAT ASBESTOS CONTAINING MATERIAL WAS PREVIOUSLY DISPOSED AT THE AOC.

_____ I HAVE VISUALY INSPECTED THE RVAAP AOC STATED ABOVE AND IDENTIFIED THE ASBESTOS CONTAINING MATERIAL DESCRIBED IN THE FIELD OBSERVATIONS SECTION.

B.0 PROJECT QUALITY ASSURANCE SUMMARY

This summary presents the actions and methodologies undertaken to meet the quality assurance/quality control (QA/QC) goals and objectives during the remedial investigation (RI) at the Anchor Test Area (RVAAP-48) area of concern (AOC) within the Ravenna Army Ammunition Plant (RVAAP). These goals and objectives were established in the following:

- *Facility-Wide Sampling and Analysis Plan for Environmental Investigations at the Ravenna Army Ammunition Plant* (USACE 2001), herein referred to as the FWSAP;
- *Performance-Based Acquisition 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1* (USACE 2009), herein referred to as the PBA08 SAP;
- Science Applications International Corporation (SAIC) QA Program; and
- United States Army Corps of Engineers (USACE), Louisville District QA requirements.

The RI was conducted under one mobilization. The QA/QC objectives were implemented through project-specific procedures and requirements, focusing on field and analytical laboratory activities and project administration.

B.1 FIELD QUALITY ASSURANCE

B.1.1 Readiness Review

SAIC conducted an internal readiness review on January 28, 2010. The purpose of the readiness review was to ensure the following:

1. Project documents [e.g., sampling and analysis plans (SAPs), field change requests (FCRs)] and procedures were approved, controlled, and properly distributed;
2. Assigned personnel were trained prior to field activities;
3. Mobilization and site logistics were established;
4. Laboratories were ready to accept samples;
5. Subcontractors were ready to begin work; and
6. QA systems were implemented.

All elements of the readiness review were completed prior to initiating field activities. The readiness review was approved by the SAIC QA/QC Officer and Project Manager.

B.1.2 Procedures

Standard operating methods for field activities are incorporated into the governing documents for the project. The FWSAP describes the overall approach and methodologies to be used for projects at RVAAP, and the PBA08 SAP details project-specific requirements for field implementation. USACE and the Ohio Environmental Protection Agency (Ohio EPA) reviewed and approved these documents prior to implementation of field activities.

Clarifications and/or planned deviations from either plan were documented as FCRs. Prior to execution of a field change, each FCR was reviewed and approved by USACE and Ohio EPA. A description of each FCR is presented in Section B.3.1. Copies of FCRs issued during the RI are included in Attachment 1 to this appendix.

Any variances from the approved plans or FCRs were documented as Nonconformance Reports (NCRs). There were no variances identified during the implementation of the RI at Anchor Test Area.

B.1.3 Training

Field team personnel were trained in all procedures applicable to assigned tasks. Training was accomplished through a combination of project kickoff meetings, reading assignments, and on-the-job (OJT) training. Training was documented by the completion of Training Assignment Records (TARs) and verified by the SAIC Field Operations Manager. Copies of TARs and training certificates are in the project file. Copies of training records required for Occupational Safety and Health Administration (OSHA) and United States Department of Transportation (USDOT) compliance were on-site during field activities.

B.1.4 Equipment Calibration

Various types of measuring and testing equipment (M&TE) were used during the field investigation. All M&TE was categorized and assigned unique identifiers. An inventory was maintained in an M&TE logbook.

Only equipment with verifiable traceability to nationally recognized standards was used in the field. Instruments were calibrated in accordance with manufacturer's instructions and frequency. Calibration activities and results were documented in the M&TE logbook, as well as source information for all calibration standards and reagents.

Equipment that did not calibrate within manufacturer’s specifications or operate properly in the field was taken out of service and replaced promptly. Replacement equipment was placed into service upon calibration. The M&TE logbook maintains documentation of all replaced equipment.

B.1.5 Quality Control Samples

Field QC samples collected for this project included trip blanks, equipment rinsate blanks, source water, and field duplicates, as specified in the PBA08 SAP. Field QA split samples were also collected and sent to a USACE contracted QA laboratory, RTI Laboratories, Inc., of Livonia, Michigan. The USACE QA laboratory performed an independent analysis and evaluation of analytical results by the contracted laboratory. Appendix C of the RI/feasibility study (FS) report presents an evaluation of data quality and analytical performance with respect to field QC results. Appendix D presents field QC data and analyses of QC samples.

B.1.6 Field Records

Field data, observations, activities, and information were recorded on daily activity logs and sampling forms. These logs and forms were bound in 3-ring binders. Each field team possessed a binder with applicable sampling forms and activity logs. This ensured all necessary data were entered consistently. Logbook entries were checked for accuracy and completeness by independent reviewers. Field records were collected upon completion of the project and maintained by the SAIC Field Operations Manager.

B.2 ANALYTICAL LABORATORY QUALITY ASSURANCE

SAIC subcontracted White Water Associates, Inc., of Amasa, Michigan, who subcontracted TestAmerica Laboratories, Inc. (herein referred to as TestAmerica) of North Canton, Ohio and West Sacramento, California, to perform chemical analysis of samples collected. The laboratories performing the analysis were certified by the National Environmental Laboratory Accreditation Conference (NELAC) and have submitted the Self Declaration Statement for compliance of the United States Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories Version 3.0 requirements. QA split samples were collected and submitted to an independent USACE, Louisville District QA laboratory (RTI Laboratories, Inc., located in Livonia, Michigan).

B.2.1 Readiness Review

Laboratory QA/QC activities were initiated during the readiness review. The readiness review verified the following:

1. Governing documents and approved analytical methods were controlled and properly distributed;
2. The laboratory was scheduled and ready to conduct the analysis;
3. Logistical coordination was established between the laboratory and the field team; and
4. Laboratory QA programs were consistent and compatible with the project requirements.

B.2.2 Procedures

Prior to initiation of analytical support, SAIC outlined project-specific requirements for White Water Associates, Inc. and TestAmerica that included the following:

- Parameters to be measured;
- Analytical methods;
  - Adherence to United States Environmental Protection Agency (USEPA) SW-846 protocols
  - USACE Shell for Analytical Chemistry Requirements, Appendix I EM200-1-3, 1 February 2001
  - DoD QSM for Environmental Laboratories Version 3.0 requirements
  - Louisville QSM Supplement requirements
- Project quantitation goals (sensitivity); and
- Data deliverables requirements.

B.2.3 Laboratory Quality Control

To document laboratory data quality and measure the quality of the analytical process, laboratory QC samples (e.g., method blanks, laboratory control samples, laboratory duplicates, and matrix spike/matrix spike duplicates) and data verification/validation were employed. The results of laboratory QC are discussed in the Data QC Summary Report (Appendix C). Analytical results of laboratory QC samples are included in Appendix D and form the basis of the data verification and validation process (Section B.2.5).

B.2.4 Laboratory Documentation

White Water Associates, Inc. and TestAmerica maintain comprehensive information regarding the entire analytical process. The laboratory delivered summary data packages and electronic deliverables to SAIC consistent with those identified in the USEPA SW-846 protocol for validation and verification. Laboratory QC sample analyses were cross-referenced to the appropriate environmental field sample analyses in the laboratory deliverables.

B.2.5 Data Verification/Validation

Analytical data generated were subjected to data verification by SAIC, as specified in the Facility-Wide Quality Assurance Project Plan (herein referred to as the FWQAPP) (USACE 2001) and the PBA08 SAP. To verify data, analytical results were compared to established criteria to which judgment was rendered regarding the acceptability and qualification of the data (Appendix C). Upon receipt of data packages from the laboratory, the information was subjected to a systematic examination following standardized checklists and procedures to ensure content, presentation, administrative validity, and technical validity. Routine data changes were documented through data change forms. Data deficiencies or formal laboratory-related nonconformances were documented through an NCR process, as required.

In addition to the SAIC data review, a 10% validation of all data will be performed by USACE to prove data usability. This review constitutes comprehensive validation of 10% of the primary dataset, comprehensive validation of the QA split sample dataset, and a comparison of primary sample, field duplicate sample, and field QA split sample information.

B.3 QUALITY ASSURANCE DOCUMENTATION

Primary methods for documenting QA were: (1) completing FCRs requiring and obtaining USACE and Ohio EPA concurrence; and (2) generating NCRs in accordance with SAIC QA procedures. Copies of FCRs completed during the investigation are included in Attachment 1. There were no NCRs generated for Anchor Test Area during the implementation of this RI.

B.3.1 Field Change Control

FCRs were submitted to present the rationale and document approval for any anticipated variances from protocols specified in the FWSAP and/or the PBA08 SAP. The FCRs provided clarification to the scope or refinement in the procedural approach to a specific field activity. All FCRs were reviewed and approved by designated technical representatives of USACE and Ohio EPA prior to implementation. None of the FCRs resulted in an adverse impact to project quality, schedule, or scope. Copies of the approved FCRs are included in Attachment 1. The following four FCRs were executed during RI activities at Anchor Test Area:

- FCR-RVAAP PBA08RI-002 documented the changes in sampling procedures and analytical methods presented in the approved PBA08 SAP;

- FCR-RVAAP PBA08RI-003 documented the use of sodium bentonite chips for backfilling surface and subsurface boreholes;

- FCR-RVAAP PBA08RI-006 revised the investigation-derived waste (IDW) management procedure for this project; and

- FCR-RVAAP PBA08RI-007 increased the survey accuracy for sampling locations from 0.2 ft to 3.0 ft.

B.3.2 Nonconformance Reports

NCRs and/or corrective action reports are generated to identify and correct conditions adverse to quality, as described in the field and laboratory QA plans. No NCRs were generated during the Anchor Test Area RI.

FIELD CHANGE REQUEST (FCR)

FCR NO. FCR-RVAAP PBA08RI-002 DATE INITIATED 02/17/10
PROJECT PBA 2008 Remedial Investigation
CONTRACT NO. GSA Contract No. W912QR-04-D-0028 Delivery Order No. 0001

REQUESTOR IDENTIFICATION
NAME Heather Miller ORGANIZATION SAIC PHONE 330-573-8571

TITLE SAIC Field Operations Manager SIGNATURE

BASELINE IDENTIFICATION
BASELINE(S) AFFECTED ☐ Cost ☐ Scope ☐ Milestone ☒ Method of Accomplishment

AFFECTED DOCUMENT (TITLE, NUMBER AND SECTION)
PBA 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1.

DESCRIPTION OF CHANGE:
SAIC would like to request the approval of a field change to the following sample procedures and analytical methods presented in the approved RI SAP. This request includes all changes discussed on the 2/8/2010 call with USACE, SAIC and RTI. Table 1 presents the requested changes, the justification and concurrence with RTI (USACE split lab) and the impact of not implementing request.

JUSTIFICATION:

These items are being requested to clarify, adjust, and revise the implementation of the PBA08 RI given new information since its "final" submittal and approval. The attached Table 1 presents the additional information on the justification of each requested change.

IMPACT OF NOT IMPLEMENTING REQUEST:

Please see Table 1 for the impact of each requested change.

PARTICIPANTS AFFECTED BY IMPLEMENTING REQUEST:
SAIC Field Manager, SAIC Field Teams, Laboratory and USACE Split Laboratory

FIELD CHANGE REQUEST (FCR-RVAAP PBA08 RI-002)

Table 1

Item Number	Description of Requested Change	Justification of Change	Impact of Not Implementing	Cost of Not Implementing
1	Nitrate Sampling at Load Line 12 SAIC would like to have surface water and wet sediment samples at Load Line 12 analyzed for nitrates to support assessments presented in the Load Line 12 Groundwater Feasibility Study. Wet sediment and Surface Water samples for nitrate will be analyzed by SW-846, 9056A.	Although nitrates were not identified above screening criteria CUGs in surface water and wet sediments samples, SAIC would like to add nitrates to the list of analytes to support the groundwater FS and verify there are no groundwater impacts to surface waters. These methods will also be consistent with methods used by the USACE split laboratory	At this point, it is assumed there is no groundwater and surface water interface of potential nitrate contamination. The additional samples will confirm or deny this assumption.	No cost impact to USACE.
2	Part II QAPP Table 2-1. Sampling and Analytical Requirements SAIC would like to remove cyanide from the list of parameters for all media.	Cyanide was inadvertently not removed from Table 2-1 after USACE and Ohio EPA provided guidance (in September 2009) that cyanide was not part of the RVAAP full suite of parameters. These methods will also be consistent with methods used by the USACE split laboratory	No documentation that cyanide was not included during the implementation of the RI SAP.	No cost impact to USACE.
3	Part II QAPP Table 2-1. Sampling and Analytical Requirements SAIC would like clarify that 43 of the soil samples and one wet sediment sample presented on Table 2-1 as Metals TAL should have been included as a separate analysis for only total chromium (only). Analysis for total chromium by SW-846, 6020 will be added.	Table 2-1 in the QAAP presented total chromium samples within the Metal TAL samples for wet sediment and soil. Only total chromium and hexavalent chromium are required for chromium speciation samples. As in Section 4.1.3 on page 4-4 of the PBA08 RI Work Plan, field duplicates (and associated splits) samples will not be collected for chromium speciation samples.	Total chromium and all other metals in the TAL metals suite would be reported.	No cost impact to USACE.
4	Part II QAPP Table 2-1. Sampling and Analytical Requirements SAIC would like to: - Add method 3541 to pesticides and PCBs to soil and wet sediment. - Replace method 8310 to 8270C for PAHs	Analytical methods were revised to achieve low detection limits for comparisons to CUGs and/or to meet the requirements of the DOD QSM 3.0.. These methods will also be consistent with methods	Actual analytical methods used not documented during implementation of RI SAP	No cost impact to USACE.

FIELD CHANGE REQUEST (FCR-RVAAP PBA08 RI-002)

Item Number	Description of Requested Change	Justification of Change	Impact of Not Implementing	Cost of Not Implementing
	for soil and wet sediment. - Add the following analytical methods to liquid and solid IDW samples: TCLP VOC: 8260B and 5030B TCLP SVOC: 8270C/3620C/3510C TCLP Pesticides: 8081A/3520C/3510C TCLP Herbicides:8151A/3520C/3510C TCLP Metals: 6010B/7470A Total Cyanide: 9010B	used by the USACE split laboratory.		
5	Part II QAPP Table 2-1, Sampling and Analytical Requirements SAIC would like to clarify that our VOC method of analysis is 8260B/5021.	Analytical method 8260B/5035 requires the use of EnCore or TerraCore samplers which is not consistent with the sampling procedures or containers presented in the PBA08 SAP and QAPP (Table 5-1). These methods will also be consistent with methods used by the USACE split laboratory.	Actual analytical methods used not documented during implementation of RI SAP	No cost impact to USACE.

BASELINE IDENTIFICATION
BASELINE(S) AFFECTED ☐ Cost ☐ Scope ☐ Milestone ☒ Method of Accomplishment

AFFECTED DOCUMENT (TITLE, NUMBER AND SECTION)
PBA 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1.

DESCRIPTION OF CHANGE:
SAIC requests approval of the following borehole backfilling procedure to supplement guidance presented in the approved PBA 2008 RI SAP.

All discrete surface locations collected with a bucket hand auger, all subsurface boreholes completed using direct push technology, and all geotechnical samples drilled using 4 ¼" hollow stem augers will be backfilled with USACE approved sodium bentonite chips at the completion of sampling activities. Sodium bentonite chips will be added through the augers as they are removed to prevent bridging within the borehole. Care will be taken to ensure that bridging does not occur in any soil boreholes by tamping and thoroughly hydrating the chips with an USACE approved water source every 5 feet until the boring is filled. Each location will be covered lightly with surrounding soil.

JUSTIFICATION:
The PBA 2008 RI SAP and FW SAP do not provide guidance on the abandonment process with respect to surface soil and subsurface direct push boreholes. SAIC requests using abandonment guidance presented in the current Ohio EPA Technical Guidance Manual for Ground Water Investigations, Chapter 9 (February 2009). This document provides guidance that sodium bentonite chips or pellets should be utilized for boreholes completed above the water table, as the use of a cement or cement-bentonite mixture may shrink when installed above the water table.

All geotechnical borings will be completed above the water table. In addition, all surface soil and subsurface direct push borings are anticipated to be completed above the water table. However, if the water table is encountered in surface soil and subsurface direct push borings, sodium-bentonite chips are still the preferred abandonment method, as they will sink through water. This text clarifies SAICs abandonment approach.

IMPACT OF NOT IMPLEMENTING REQUEST:
Surface and subsurface soil borehole (direct push) backfilling activities will not be formally documented/approved.

PARTICIPANTS AFFECTED BY IMPLEMENTING REQUEST:
SAIC Field Manager, SAIC Field Teams and Drilling Subcontractor.

FIELD CHANGE REQUEST (FCR-RVAAP PBA08RI-006)

Table 1

Item Number	Description of Requested Change	Justification of Change	Impact of Not Implementing	Cost of Not Implementing
1	IDW- PPE and Expendable Sampling Equipment SAIC would like to request that only potentially contaminated PPE and expendable sampling equipment be drummed and disposed as non-hazardous waste. These items would be field screened and segregated as specified in Section 7.1 of the FWSAP. Non-contaminated PPE and expendable sampling equipment will be disposed of in sanitary trash.	The PBA 08 RI SAP does not distinguish between potentially contaminated and non-contaminated expendables/solid waste.	Non-contaminated wastes would have to tracked, labeled, sampled, and disposed of as potentially contaminated material.	No cost impact to USACE.
2	IDW - Soil Cuttings SAIC would like to request combining soil cutting from the various AOCs as a best management practice to reduce the number of partially filled soil IDW drums. One composite IDW sample from all drums containing soil cuttings will be collected in accordance with Section 7.4.1 of the FWSAP and characterized for waste disposal at the end of the field cycle.	SAIC does not anticipate large quantities of soil IDW being generated during the investigation given soil borings will be accomplished using direct push technology. Combining the soil cuttings will maximize the use of each drum and minimize the potential for partially filled drums. Based on the sampling results of the previous investigations at the 17 AOCs, the concentrations of potential COCs in soil would not be classified as hazardous waste.	Many of the drums of IDW soil would contain as little as five gallons of soil.	No cost impact to USACE.

AFFECTED DOCUMENT (TITLE, NUMBER AND SECTION)
PBA 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No. 1.

DESCRIPTION OF CHANGE:

Survey Precision
The horizontal coordinates of all sampling locations and the corners of MI sample areas presented in the site specific appendices will be marked in the field utilizing a GPS unit within 1 m (3 ft). Elevations of these locations will not be recorded.

For the installation of any future monitoring wells, the location and elevation will be surveyed to an accuracy of 0.06 m (0.2 ft).

JUSTIFICATION:

This change would be to clarify the intention of using a GPS unit to stake locations for the identified MI sampling areas.
A higher resolution survey of monitoring wells (if installed) would be used as presented in the approved PBA 08 RI SAP.

IMPACT OF NOT IMPLEMENTING REQUEST:

As presented, the level of accuracy for obtaining MI sample area corners could only be met utilizing a licensed surveyor. This change clarifies that a GPS unit would be acceptable to mark sample locations. Well installations would be surveyed by a licensed surveyor.

PARTICIPANTS AFFECTED BY IMPLEMENTING REQUEST:

SAIC Field Manager and SAIC Field Teams.

C.0 PROJECT QUALITY ASSURANCE SUMMARY

C.1 PURPOSE OF THIS REPORT

Environmental data must always be interpreted relative to its known limitations and its intended use. As can be expected in environmental media, there are areas and data points where the user needs to be cautioned relative to the quality of the project information presented. The data verification process and this data quality assessment (DQA) are performed to provide current and future data users assistance in the interpretation of these data.

The purpose of this DQA report is to describe

1. The quality control (QC) procedures followed to ensure data generated by Science Applications International Corporation (SAIC) during the remedial investigations (RIs) at the Ravenna Army Ammunition Plant (RVAAP) meet project requirements;

2. The quality of the data collected; and

3. The problems encountered during the course of the study and their solutions.

A separate Chemical Quality Assessment Report may be completed by the United States Army Corps of Engineers (USACE) quality assurance (QA) representative and would cover data generated from QA split samples remanded to their custody.

This report provides an assessment of the analytical information gathered during the implementation of the RI at Anchor Test Area at RVAAP. It documents the quality of the data utilized for the RI report and assesses if QA/QC objectives were met. Evaluation of field and laboratory QC measures will constitute the majority of this assessment; however, references also will be directed toward those QA procedures that establish data credibility. The primary intent of this assessment is to illustrate that, except as noted, data generated for this investigation can withstand scientific scrutiny; are appropriate for their intended purpose; are technically defensible; and are of known and acceptable sensitivity, precision, and accuracy.

Multiple activities were performed to achieve the desired data quality for this project. As discussed in the RI report, decisions were made during the initial scoping of the RI to define the quality and quantity of data required. Data quality objectives (DQOs) were established to guide the implementation of the field sampling and laboratory analysis [refer to the *Performance Based Acquisition 2008 Supplemental Investigation Sampling and Analysis Plan Addendum No.1* (USACE 2009), herein referred to as the PBA08 SAP]. A QA program was established to standardize procedures and to document activities [refer to the *Facility-wide Quality Assurance Project Plan for Environmental Investigations* (USACE 2001), herein referred to as the FWQAPP, and Part II of the PBA08 SAP]. This program provided a means to detect and correct any deficiencies in the process.

Upon receipt by the project team, data were subjected to verification and validation review by an automated data review (ADR) process to identify and qualify problems related to the analysis. These review steps contributed to this final DQA where data used in the investigation are identified as having met the criteria and are being utilized appropriately.

C.2 QUALITY ASSURANCE PROGRAM

The FWQAPP and Part II of the PBA08 SAP were developed to guide the RI for Anchor Test Area. The purposes of these documents were to enumerate the quantity and type of samples to be taken to inspect the area of concern (AOC) and to define the quantity and type of QA/QC samples to be used to evaluate the quality of the data obtained. The FWQAPP established requirements for both field and laboratory QC procedures. In general, field QC duplicates and QA split samples were required for each environmental sample matrix collected in the area being investigated; volatile organic compound (VOC) trip blanks were to accompany each cooler containing water samples for VOC determinations; and analytical laboratory QC duplicates, matrix spikes (MSs), laboratory control samples (LCSs), and method blanks were required for each preparation batch of 20 samples or less for each matrix and analyte.

A primary goal of the RVAAP QA program was to ensure that the quality of results for all environmental measurements was appropriate for their intended use. To this end, the FWQAPP and standardized field procedures were compiled to guide the investigation. Through the process of readiness review, training, equipment calibration, QC implementation, and detailed documentation, the project has successfully accomplished the goals set for the QA program.

C.2.1 Monthly Progress Reports

Monthly Progress Reports (MPRs) were completed by the SAIC Project Manager for the duration of the project. The MPRs contained the following information: work completed, problems encountered, corrective actions/solutions, summary of findings, and upcoming work. These reports were issued to the USACE, Louisville District Project Manager by e-mail with copies forwarded to the Ohio Environmental Protection Agency (Ohio EPA). Access to these reports can be obtained through the USACE, Louisville District Project Manager.

C.2.2 Daily Activity Logs

The Field Team Leader completed Daily Activity Logs. These include information such as, but not limited to, on-site sub-tier contractors, equipment on-site, work performed summaries, QC activities, health and safety activities, problems encountered, and corrective actions.

C.2.3 Laboratory "Definitive" Level Data Reporting

The Quality Assurance Project Plan (QAPP) for this project identified requirements for laboratory data reporting and identified TestAmerica Laboratories, Inc. (TestAmerica) of North Canton, Ohio (a

subcontractor to White Water Associates Inc., Amasa, Michigan), as the laboratory for the project. During project execution, the TestAmerica facility in North Canton, Ohio, performed all of the analyses, except explosives and propellants, which were performed at the TestAmerica facility in West Sacramento, California. Collected QA split samples were analyzed by USACE's contracted QA Laboratory, RTI Laboratories, Inc., of Livonia, Michigan. TestAmerica and RTI Laboratories, Inc. are accredited by the United States Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP). All analytical procedures were completed in accordance with applicable professional standards; United States Environmental Protection Agency (USEPA) requirements; government regulations and guidelines; the DoD Quality Systems Manual (QSM), Version 3; USACE, Louisville District analytical QA guidelines; and specific project goals and requirements. USEPA "definitive" data have been reported, including the following basic information:

- Laboratory case narratives;
- Sample results (soil/sediment reported per dry weight);
- Laboratory method blank results;
- LCS results;
- Laboratory sample MS recoveries;
- Laboratory duplicate results;
- Surrogate recoveries [VOCs, semi-volatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), and explosives];
- Initial and continuing calibrations;
- Sample preparation dates; and
- Sample analysis dates.

This information from the laboratory, along with field information, provides the basis for subsequent data evaluation relative to sensitivity, precision, accuracy, representativeness, and completeness. These are presented in Section C.4.

C.3 DATA VERIFICATION

The objective when evaluating the project data quality is to determine its usability. The evaluation is based on the interpretation of laboratory QC measures, field QC measures, and the project DQOs.

This project implemented ADR software to facilitate laboratory data review. The ADR output was reviewed by the project-designated verification staff.

C.3.1 Field Data Verification

Field-generated documents such as sampling logs, boring logs, daily health and safety summaries, daily safety inspections, equipment calibration and maintenance logs, and sample management logs were peer-reviewed on-site.

C.3.2 Laboratory Data Verification

Analytical data generated for this project have been subjected to a process of automated data verification and review. The following describes this systematic process and the evaluation activities performed. Several criteria have been established against which the data were compared and from which a judgment was rendered regarding the acceptance and qualification of the data. Because it is beyond the scope of this report to cite those criteria, the reader is directed to the following documents for specific detail:

- PBA08 SAP.
- DoD – *Quality Systems Manual for Environmental Laboratories*, Version 3, January, 2006.
- USACE, Louisville District, *Louisville DoD Quality Systems Manual Supplement*, Version 1, March, 2007.
- USEPA – *Contract Laboratory Program National Functional Guidelines for Organic Data Review*, EPA-540/R-99/008, October, 1999.
- USEPA – *Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, EPA-540/R-94/013, February, 1994.
- SAIC Technical Support Contractor QA Technical Procedure (TP-DM-300-7), *Data Verification and Validation*.

Upon receipt of field and analytical data, verification staff performed a systematic examination of the reports, including ADR software, to ensure the content, presentation, and administrative validity of 100% of the data. Discrepancies identified during this process were recorded and documented utilizing the ADR. Any discrepancies were resolved prior to database flag entry. As part of data verification, standardized laboratory electronic data deliverables were subjected to review. This technical evaluation ensured that all contract-specified requirements had been met, and that electronic information conformed to reported hardcopy data. Outlier reports from the ADR software review are included as Attachment 1 to this appendix. QA Program Nonconformance Report and Corrective Action systems were implemented as required.

During the verification phase of the review and evaluation process, data were subjected to a systematic technical review by examining all field and analytical QC results and laboratory documentation following USEPA functional guidelines, DoD QSM criteria, and SAIC internal procedures for laboratory data review. These data review guidelines define the technical review criteria, methods for evaluating the criteria, and actions to be taken resulting from the review of these criteria. The primary objectives of this phase were to assess and summarize the quality and reliability of the data for the intended use and to document factors that may affect the usability of the data. This process did not include in-depth review of raw data instrument out-put or re-calculation of results from the primary instrument out-put. This data verification and analytical review process included, but was not necessarily limited to, the following parameters:

- Data completeness;
- Analytical holding times and sample preservation;
- Calibration (initial and continuing);
- Method blanks;
- Sample results verification;
- Surrogate recovery;
- LCS analysis;
- Internal standard performance;
- MS recovery;
- Duplicate analysis comparison;
- Reported detection limits;
- Compound, element, and isotope quantification;
- Reported detection levels;
- Method reporting levels; and
- Secondary dilutions.

As an end result of this phase of the review, the data were qualified based on the technical assessment of the verification criteria. Qualifiers were applied by the ADR to each field and analytical result to indicate the usability of the data for its intended purpose.

C.3.3 Definitions of Data Qualifiers (Flags)

During the data verification process, all laboratory data were assigned appropriate data qualification flags and reason codes. Qualification flags are defined as follows:

"U" Indicates the analyte was analyzed for, but not detected above, the level of the associated value.

"J" Indicates the analyte was positively identified; however, the associated numerical value is an approximate concentration of the analyte in the sample.

"UJ" Indicates the analyte was analyzed for, but not detected above, the associated value; however, the reported value is an estimate and demonstrates a decreased knowledge of its accuracy or precision.

"R" Indicates the analyte value reported is unusable. The integrity of the analyte's identification, accuracy, precision, or sensitivity has raised significant questions as to the reality of the information presented.

C.3.4 Data Acceptability

A total of 21 environmental soil and 3 field duplicate QC samples were collected with approximately 1,350 discrete analyses (i.e., analytes) being obtained, reviewed, and integrated into the assessment (these totals do not include field measurements and field descriptions). Under the direction of the PBA08 SAP and the USACE, Louisville District, the project successfully collected RI samples and produced acceptable results for 100% of the sample analyses performed.

Table C-1 presents a summary of all targeted field QC and QA split samples collected during the investigation. Cross references for duplicate and QA split sample pair numbers are presented on Table C-2 along with the requested parameters for each sample. Table C-3 provides a summary of qualified analyses grouped by media and analyte category, and Table C-4 shows the individual results qualified during review. The majority of estimated values were based on values observed between the laboratory method detection limits (MDLs) and the project reporting levels (values determined in this region have an inherently higher variability and need to be considered estimated at best), MS recoveries, surrogate recoveries, and continuing calibrations.

Two equipment rinsates and one deionized source water blank were collected for the entire field cycle. The potable water source was previously tested for use by Ohio EPA and USACE. Approval documentation is referenced under the Performance-Based Acquisition 2008 (PBA08) Sharon Conglomerate Well Installation task. The project goal for blanks is to achieve concentrations less than the reporting levels. Table C-5 summarizes analytes that were detected in these blanks. The potable water blank (SCFqc-001-0001) showed detected concentrations for 12 metals and 8 miscellaneous general chemistry analytes. Of these, barium, calcium, iron, magnesium, manganese, nickel, potassium, sodium, and the general chemistry analytes exceeded their reporting limits. As noted, the results have been previously reviewed and accepted by Ohio EPA and USACE.

Toluene was the only analyte detected in the PBA08 field blank (PBA08-QC-6000-FB) and it was well below the laboratory reporting limit. The PBA08 RI equipment rinsate blanks (PBA08-QC-6001-ER and PBA08-QC-6002-ER) showed detections for a total of eight metals, five SVOCs, and three VOCs. Of the metals, only manganese and nickel in one rinsate and zinc in both rinsates exceeded the reporting limit, but all except nickel were below 2 x the reporting limit. Only one VOC and one SVOC were detected slightly above the reporting limit. These analytes (acetone and bis[2-ethylhexyl]phthalate) are common laboratory contaminants. In general, the field blank and rinsate blank results indicate that the equipment decontamination procedure was effective and the potential for sample contamination due to ambient field conditions is very low.

Table C-1. Number of Samples Taken at Anchor Test Area

Media	Environmental Samples	Field Duplicates	USACE Split Samples	Trip Blanks	Equipment Rinse Blanks[a]	Source Water Blanks[b]
Soil	21	3	3	0	2	2

[a]Equipment rinse blanks were collected at a frequency of two per field cycle for the entire Performance Based Acquisition 2008 (PBA08) Remedial Investigation (RI) for the 17 areas of concern (AOCs) as presented in Section 4.6 of the PBA08 Sampling and Analysis Plan (PBA08 SAP).
[b]Source water blanks for deionized and potable water used during equipment decontamination were evaluated for the entire PBA08 RI for the 17 AOCs as presented in Section 4.6 of the PBA08 SAP.
USACE = United States Army Corps of Engineers

Data Qualifiers: J = estimated, U = not detected, and UJ = not detected and reporting limit estimated
CAS = Chemical Abstracts Service
NA = Not Applicable
SVOC = Semi-volatile Organic Compound
VOC = Volatile Organic Compound

C.4 DATA QUALITY EVALUATION

C.4.1 Metals Analysis in Soil

Analytical holding times were met for all samples. Initial calibrations were achieved for all elements analyzed. Continuing calibrations were acceptable for most elements analyzed, except for slightly high recovery for aluminum at 110.6%, which caused three results (0.62% of metals data) for this analyte to be qualified as estimated "J." One selenium result (0.21% of metals data) was qualified as estimated "J" due to an LCS recovery outside of control limits. All other LCS recoveries were acceptable. Method blank levels did not result in any data to be qualified. However, continuing calibration blank levels did result in qualification of silver in five samples as non-detectable concentration "U" or estimated non-detectable concentration "UJ." Antimony in 13 samples, barium in 1 sample, and zinc in 1 sample (3.1% of metals data) were qualified as estimated "J" due to low MS results. Other metals exhibited acceptable recoveries and were not qualified. Reporting levels are considered to be acceptable relative to the QAPP goals. Dilutions of 1:10 were required to bring concentrations of aluminum in 12 samples and manganese in two samples to within the instrument calibration range. Serial dilution results were acceptable for most elements except for slightly high percent difference (%D) for aluminum at 10.6%, which caused positive results for aluminum to be qualified as estimated "J" in 11 associated samples (2.42% of metals data). Although some analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in the RVAAP Environmental Information Management System (REIMS).

C.4.2 Volatile Organic Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries, internal standard areas/retention times, initial calibrations, and LCS recoveries were acceptable for all analytes analyzed. Continuing calibrations were acceptable for most analytes with the exception of less than negative 20% difference (%D) values for carbon tetrachloride, which caused non-detectable concentration results in four samples (2.9% of VOC data) to be qualified as estimated non-detectable concentration "UJ." Method blanks were free of contamination with the exception of low levels of acetone, 2-butanone, 2-hexanone, and toluene. One associated sample result (0.71% of VOC data) was qualified as non-detectable concentration "U" for acetone. MS/matrix spike duplicate (MSD) did not apply to this sample set. No samples required dilutions or re-analyses. Although some analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.3 Semi-volatile Organic Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries were acceptable for these analyses. Internal standard area counts and compound retention times were acceptable throughout the data analyses. Initial and continuing calibration criteria were met for all compounds. Method blanks were free of contamination for most analytes with the exception of low level bis(2-ethylhexyl)phthalate in one blank, which caused this analyte in two associated samples (0.76% of SVOC data) to be qualified as not detected "U." All LCS recoveries were within criteria. MS/MSD did not apply to any samples in this sample set. No samples required dilutions or re-analyses. Although a few positive results were qualified as estimated because associated values were less than the reporting levels, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.4 Pesticide Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries were acceptable for all pesticide analyses. Initial calibration criteria were met for all compounds. Two 4,4'-DDD results (2.4% of pesticides data) were qualified as estimated due to continuing calibration %D greater than 20%. All other pesticide continuing calibration criteria were acceptable. Method blanks were free of contamination and had no impact on the sample data. All LCS recoveries were within criteria. All pesticide MS/MSD recoveries and relative percent difference (RPD) results were within control limits. Two pesticide samples required 1:2 dilutions; however, all MDLs and reporting limits were reported below the facility-wide cleanup goals (FWCUGs). Although some analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.5 Polychlorinated Biphenyl Analysis in Soil

Analytical holding times were met for all samples. Surrogate recoveries were acceptable for all PCB analyses. Initial calibration criteria were met for all compounds. All PCB continuing calibration criteria were acceptable. Method blanks were free of contamination and had no impact on the sample data. All LCS recoveries were within criteria. All PCB MS/MSD recoveries and RPD results were within control limits. No PCB samples required dilutions. Although some analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.6 Explosives and Nitroglycerin Analyses in Soil

Analytical holding times were met for all samples. Surrogate recoveries were acceptable for these analyses. Initial and continuing calibration criteria were met for all compounds. Method blanks were free of contamination and had no impact on the sample data. All LCS recoveries were within criteria. MS/MSD recoveries and RPD values were acceptable for most analytes with the exception of slightly low recoveries for 4-amino-2,6-dinitrotoluene, which caused this result in parent sample ATASB-010-5141-SO to be qualified as estimated non-detectable concentration "UJ." No explosives samples required dilutions. Although a few results were qualified as estimated because they were between the detection limit and the reporting limit, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.7 Nitroguanidine, Nitrocellulose, and Hexavalent Chromium Analyses in Soil

Analytical holding times were met for all samples. Initial and continuing calibration criteria were met for all compounds. Method blanks for nitroguanidine and hexavalent chromium were free of contamination and had no impact on the sample data. However, one method blank contained nitrocellulose at 0.80 mg/kg, which caused this analyte in associated sample ATASS-015M-5036-SO to be qualified as estimated non-detectable concentration "UJ." All LCS recoveries were within criteria. MS/MSD recoveries and RPD values were acceptable for this data set. No dilutions or re-analyses were required. Although some analyses were qualified as estimated, the deviations observed should not have a primary influence on the results, and the values are considered technically sound and defensible. No data were rejected. Complete data summary tables, with associated qualifiers, are provided in Appendix D of the RI report and can be found in REIMS.

C.4.8 Precision

Field duplicate samples were collected to ascertain the contribution to variability (i.e., precision) due to the combination of environmental media, sampling consistency, and analytical precision. Field duplicate samples were collected from the same spatial and temporal conditions as the primary environmental sample. Soil samples were collected from the same sampling device after homogenization for all analytes except VOCs.

Field duplicate comparison information is presented in Table C-6. If a given analyte was not detected in both the regular and field duplicate sample, precision was considered acceptable and the results were not included in the table. The RPD was calculated only when both samples were >5 x the reporting level. When one or both sample values were between the reporting level and 5 x the reporting level, the absolute difference (D) was evaluated. Tables 3-1 and 3-2 of the FWQAPP set the RPD criteria at 50% for soil and sediment and at 30% for water, while the absolute difference is set at 1 x the reporting limit for all matrices. Field duplicate comparisons for Anchor Test Area are considered good, with all results below an absolute difference of 1 or an RPD of 50%, with the

exception of magnesium at 55% RPD in soil in field duplicate pair ATASB-006-5127-SO/ATASB-006-6080-FD.

ATASS-016M-5037-SO/ ATASS-016M-6047-FD	PETN	0.5 U	0.11 J	(0.78)	D

[a]RPD is calculated as 100 x |R-D|/(R-D)/2, where R is the concentration of the regular sample and D is the concentration of the duplicate. The absolute difference is calculated as |R-D|/L, where L is the average reporting limit of the two samples. Values followed by a "%" are RPD values. Values in parentheses are absolute difference values.

[b]The test used to evaluate the duplicate comparison is the RPD if both sample results were more than 5 x the reporting limit or the absolute difference (D) if any result was less than 5 x the reporting limit

*RPD or D outside criteria

Data Qualifiers: J = Estimated, U = Not detected, and UJ = Not detected and reporting limit estimated

RPD = Relative Percent Difference

C.4.9 Sensitivity

Determination of minimum detectable values allows the investigation to assess the relative confidence that can be placed in a value relative to the magnitude or level of analyte concentration observed. The closer a measured value comes to the minimum detectable concentration, the less confidence and more variation the measurement will have. Project sensitivity goals were expressed as quantitation level goals in the QAPP. Individual analyte reporting levels can vary due to inherent moisture content variability, matrix differences, and contaminant analyte concentrations. Two manganese and 14 aluminum results were reported from 1:10 dilutions because of elevated concentrations present in the samples. All pesticide results for samples ATASS-015M-5036-SO and ATASB-008-5133-SO were reported from 1:2 dilutions. These dilutions did not cause any reporting levels for undetected concentrations to be elevated above FWCUGs. Reporting levels were elevated in soil due to dilution factors, inherent moisture content variability, and results being reported in the standard dry weight format. Reporting level variations have been considered during data interpretation and statistical applications.

Method blank determinations were performed with each analytical sample batch for each analyte under investigation. These blanks were evaluated during data review to determine their potential impact on individual data points, if any. Review action levels are set at 5 x the reporting level for all analytes, except those designated as common laboratory contaminants (methylene chloride, acetone, toluene, 2-butanone, and phthalate compounds) with action levels set at 10 x reporting levels. During data review, reported sample concentrations are assessed against method blank action levels, and the following qualifications are made when reportable quantities of analytes were observed in the associated method blank:

- When the analyte sample concentration is above 5 or 10 x the action level, the data are not qualified and it is considered a positive value.

- When inorganic analyte sample concentrations are determined to be below 5 or 10 x the action level, the data are considered impacted by the method blank and the value reported is qualified as a non-detectable concentration at the analyte value reported. These data are then qualified as "U."

- When organic analyte sample concentrations are determined to be below 5 or 10 x the action level, the data are considered impacted by the method blank and the value reported is qualified as a non-detectable concentration. If the reported value is below the reporting level, the result is qualified as a non-detectable concentration at the reporting level. If the result is above the reporting limit, it is qualified as a non-detectable concentration at the analyte value reported. These data are then qualified as "U."

No data were rejected as a result of method blank contamination; however, various analytes were qualified as non-detectable concentration "U" according to the validation in Table C-3.

C.4.10 Representativeness and Comparability

Representativeness expresses the degree to which data accurately reflect the analyte or parameter of interest for the environmental site and is the qualitative term most concerned with the proper design of the sampling program. Factors that affect the representativeness of analytical data include proper preservation, holding times, use of standard sampling and analytical methods, and determination of matrix or analyte interferences. Samples were hand-delivered to the laboratory by the TestAmerica courier and were received within temperature specifications and in good condition. A few samples were received at a temperature of 0.8°C; this did not impact the quality of the data. No holding time deviations were observed.

Comparability, like representativeness, is a qualitative term relative to an individual project data set. The RI employed appropriate sampling methodologies, site surveillance, use of standard sampling devices, uniform training, documentation of sampling, standard analytical protocols/procedures, QC checks with standard control limits, and universally accepted data reporting units to ensure comparability to other data sets. Through the proper implementation and documentation of these standard practices, the project has established the confidence that the data will be comparable to other project and programmatic information. Table C-7 presents the standardized parameter groups, sample containers, preservation techniques, and associated holding times for environmental media.

C.4.11 Completeness

Usable data are defined as those data that pass individual scrutiny during the verification and validation process and are accepted for unrestricted application to the human health risk assessment evaluation or equivalent-type applications. Estimated data have been determined to be acceptable for RVAAP project objectives.

The completeness goal for analytical data is 90%, as defined in Tables 3-1 and 3-2 of the FWQAPP. The project achieved this goal by collecting all samples presented in the PBA08 SAP and producing usable results for 100% of all samples performed.

C.5 DATA QUALITY ASSESSMENT SUMMARY

The overall quality of the Anchor Test Area RI information meets or exceeds the established project objectives. Through proper implementation of the project data verification and assessment process, project information has been determined to be acceptable for use.

Data, as presented, have been qualified as usable and estimated "J" or "UJ." Data that have been estimated provide indications of either accuracy, precision, or sensitivity being less than desired but adequate for interpretation. No data were rejected for this sample set. Qualifiers have been applied to data when necessary.

Data produced for this project demonstrate they can withstand scientific scrutiny; are appropriate for its intended purpose; are technically defensible; and are of known and acceptable sensitivity, precision, and accuracy. Data integrity has been documented through proper implementation of QA and QC measures. The environmental information presented has an established confidence that allows utilization for the project objectives and provides data for future needs.

Table C-7. Container Requirements for Soil Samples at RVAAP

Analyte Group	Container	Minimum Sample Size	Preservative	Holding Time
Volatile Organic Compounds	One 2-oz glass jar with septum cap (no headspace)	20 g	Cool, 4°C	14 days
Semi-volatile Organic Compounds	4-oz glass	30 g	Cool, 4°C	14 days (extraction) 40 days (analysis)
Pesticide Compounds	4-oz glass	30 g	Cool, 4°C	14 days (extraction) 40 days (analysis)
Polychlorinated Biphenyls	4-oz glass	30 g	Cool, 4°C	14 days (extraction) 40 days (analysis)
Polycyclic Aromatic Hydrocarbon Compounds	4-oz glass	30 g	Cool, 4°C	14 days (extraction) 40 days (analysis)
Explosive Compounds	4-oz glass	10 g	Cool, 4°C	14 days (extraction) 40 days (analysis)
Nitroguanidine	4-oz glass	10 g	Cool, 4°C	14 days (extraction) 40 days (analysis)
Nitrocellulose	4-oz glass	10 g	Cool, 4°C	14 days (extraction) 40 days (analysis)
Metals (TAL)	4-oz glass or plastic	20 g	Cool, 4°C	180 days; Hg at 28 days
Hexavalent Chromium	4-oz glass	20 g	Cool, 4°C	24 hr (extraction) 24 hr (analysis)
Geotechnical Parameters	Moisture/Density/Porosity/K – Shelby tube TOC – no special container Grain Size Fraction – no special container	Various 100 g 5,000 g	Air tight, cool Cool NA	NA

Hg = Mercury
K= Permeability
NA = Not Applicable
RVAAP = Ravenna Army Ammunition Plant
TAL = Target Analyte List
TOC= Total Organic Carbon

CASE NARRATIVE

CASE NARRATIVE

A0B250453

The following report contains the analytical results for five solid samples submitted to TestAmerica North Canton by SAIC from the RVAAP PBA2008 17 AOCS RI Site, project number 172819.00.09456.00.9200.02.200. The samples were received February 25, 2010, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. Preliminary results were provided to Jenny Vance, Heather Miller, Marie Simpson, and Richard Sprinzl on March 04, 2010. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Mark J. Loeb, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were 0.8 and 1.2°C.

GC/MS VOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The samples affected are ATASB-008-5135-SO. The QCMRL opener had three compounds above 130 percent. The compounds are Bromomethane at 133.06 percent, Carbon Tetrachloride at 135.24 percent and Toluene at 134.03 percent. All three compounds had no reportable results in any of the samples. The QCMRL closer had 1 out of the 3 compounds above 130 percent, which is Carbon Tetrachloide at 134.43 percent. The QCMDL detected Carbon Tetrachloride and,all the other compounds as well.

GC/MS SEMIVOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 0057039 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

PESTICIDES-8081

The analytical results met the requirements of the laboratory's QA/QC program.

POLYCHLORINATED BIPHENYLS-8082

The analytical results met the requirements of the laboratory's QA/QC program.

CASE NARRATIVE (continued)

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

Matrix spike recovery and relative percent difference (RPD) data were not calculated for some analytes for batch(es) 0057017 due to the sample concentration reading greater than four times the spike amount. See the Matrix Spike Report for the affected analytes which will be flagged with "NC, MSB".

The matrix spike/matrix spike duplicate(s) for batch(es) 0057017 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

Some reporting limits are lower than our standard reporting limit (SRL) but are supported by the laboratory's MDL and/or IDLs; however, there are no standards in the calibration curve low enough to support these values(s). The continuing calibration blanks and method blanks may not support the lower RL.

No Mercury or ICP MS Form IX provided for batch(es) 0057017. The serial dilution were performed on a different sample from the same QC batch(es).

Per client approval, it is acceptable to use the criteria for method banks (<1/2 the RL or <1/10 the lowest concentration in the associated samples) for CCB’s for the metals analysis.

GENERAL CHEMISTRY

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Data review checklist: 8260 A/8260B/624 Initial Calibration

Method (check the applicable box): ☐ 8260A ☒ 8260B ☐ 624

Analysis Date: _____ **Run batch ID:** R001144-IC

Curve ID: R001144/R001144-BB **(curve ID must include instrument designation and date reference)**

Acceptance criteria is found in the applicable laboratory SOP. If item is N/A, mark as such in Notes column

Item for review	Level I Yes	Level I No	Level II Yes	Level II No
Tune:				
BFB passes, all points within 12 hr clock (24 hr for 624)	Yes		Yes	
All calibration points ID'd on Calibration Summary Form	Yes		Yes	
Documentation: Raw data and run logs present for all points	Yes		Yes	
Run log and Raw data clearly indicate method by version	Yes		Yes	
RLs: Minimum of 5 points, lowest standards at or below RL	Yes		Yes	
Linearity: 8260 CCCs ≤ 30% RSD	Yes		Yes	
Linear Regression curve fit for all >15% RSD (35% 624) r2>0.980 (r>0.990)	Yes		Yes	
Plots for all Linear Regressions printed	Yes		Yes	
Response: SPCCs all pass minimum response factors	Yes		Yes	
ICV- Second source standard Analytes 60-140% recovery, problem compounds may be allowed outside these limits, but must be evaluated (acrolein, acrylonitrile, 2-ceve, propionitrile, trans 1,4-dichloro-2-butene) Internal Standards 50-200% of recent curve	Yes		Yes	
Manual integrations: necessary, correct & documented	NA		NA	
Other: Verify Avg RF on Cal Summary matches Avg RF on Con Cal form	NA		NA	

Reviewed by Analyst/ Level I: _____ Date: 1-19-10

Reviewed by Peer/Sup/ Level II: _____ Date: 1-18-10

By signing in "Reviewed by" above I agree that I have reviewed the data as indicated on this checklist.

*Peer/Sup only: In addition to the items above, all manual integrations in this package have been reviewed and found acceptable.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
R - Spike/Surrogate failed recovery limits.

QC Flag Legend

A - Target compound detected but, quantitated amount
    exceeded maximum amount.
R - Spike/Surrogate failed recovery limits.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.

AREA AND RT SUMMARY

Instrument ID: a4ag2.i
Lab File ID: LV3JM1AD.D
Lab Smp Id: LV3JM1AD
Analysis Type: SV
Quant Type: ISTD
Operator: 046900
Method File: \\cansvr11\dd\chem\MSS\a4ag2.i\00301A.b\8270C-625.m
Misc Info:

Calibration Date: 01-MAR-2010
Calibration Time: 07:38
Client Smp ID: ATASB-008-5135-SO
Level: LOW
Sample Type: SOIL

		AREA LIMIT			
COMPOUND	STANDARD	LOWER	UPPER	SAMPLE	%DIFF
1 1,4-Dichlorobenze	274415	137208	548830	150927	-45.00
2 Naphthalene-d8	1113812	556906	2227624	649650	-41.67
3 Acenaphthene-d10	617736	308868	1235472	428805	-30.58
4 Phenanthrene-d10	1034596	517298	2069192	778168	-24.79
5 Chrysene-d12	1265955	632978	2531910	852857	-32.63
6 Perylene-d12	1179942	589971	2359884	863519	-26.82

		RT LIMIT			
COMPOUND	STANDARD	LOWER	UPPER	SAMPLE	%DIFF
1 1,4-Dichlorobenze	3.50	3.00	4.00	3.50	-0.16
2 Naphthalene-d8	4.41	3.91	4.91	4.40	-0.13
3 Acenaphthene-d10	5.69	5.19	6.19	5.68	-0.10
4 Phenanthrene-d10	6.79	6.29	7.29	6.78	-0.08
5 Chrysene-d12	8.77	8.27	9.27	8.77	-0.06
6 Perylene-d12	10.19	9.69	10.69	10.19	-0.06

AREA UPPER LIMIT = +100% of internal standard area.
AREA LOWER LIMIT = - 50% of internal standard area.
RT UPPER LIMIT = + 0.50 minutes of internal standard RT.
RT LOWER LIMIT = - 0.50 minutes of internal standard RT.

QC Flag Legend

Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

Catalog No. : 558557 Lot No.: A070237
Description : Custom o-Toluidine Standard
Expiration Date[1]: September 2011 Storage: Refrigerate

Elution Order	Compound	CAS #	Percent Purity [2]	Concentration [3] (weight/volume)	% Uncertainty [4] (95% C.L.; K=2)
1	o-Toluidine	95-53-4	99%	100.000 ug/ml	+/-0.72 %
Solvent:	Acetone	67-64-1	99%		

Column:
30m x .25mm x .25um
Rtx-5 (cat.#10223)

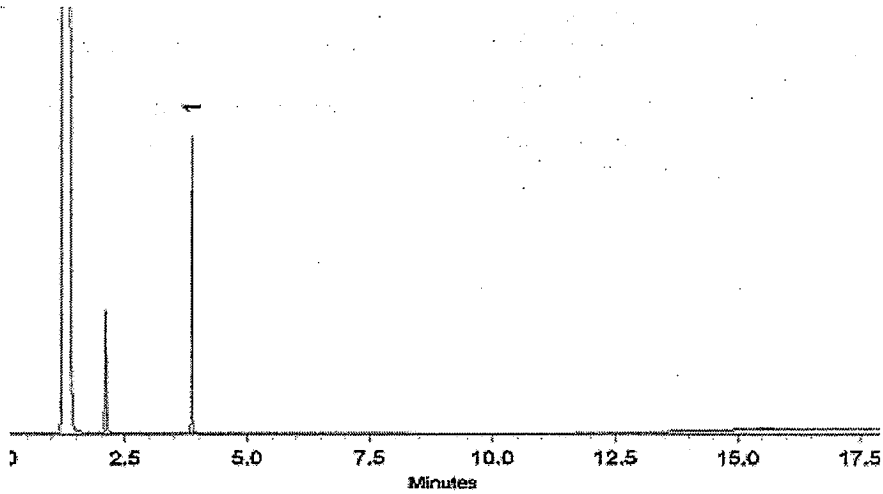
Carrier Gas:
hydrogen-constant pressure 10 psi.

Temp. Program:
75°C (hold 1 min.) to 330°C
@ 20°C/min. (hold 5 min.)

Inj. Temp:
250°C

Det. Temp:
330°C

Det. Type:
FID



Sara Eyster QA Analyst Date Passed: 09/23/2009 Balance: 1128342314

Manufactured under Restek's ISO 9001-2000
Registered Quality System
Certificate #FMB0397

1 Expiration date of the unopened ampule stored at recommended temperature.
2A Purity was determined by one or more of the following techniques: GC/FID, HPLC, GC/ECD, GC/MS. Value rounded to the nearest whole number. In addition to detectors listed above, chemical identity and purity are confirmed using one or more of the following: MS, DSC, solid probe MS, GC/FPD, GC/NPD, GC/TC, FTIR, melting point, refractive index, and Karl Fisher. See data pack or contact Restek for further details.
2B Compounds with a listed purity of less than 99% have been weight corrected to compensate for impurities.
2C Compounds with a listed purity of less than 99% may be salts, derivatives, or hydrates. The listed purity is actually a correction factor that was used to calculate the amount of compound necessary to achieve the desired concentration of the parent compound.
2D Purity of isomeric compounds is reported as the sum of the isomers. Value is rounded to the nearest whole number after summation.
3 Based upon gravimetric preparation with balance calibration verified using NIST traceable weights (seven mass levels).
4 Uncertainties determined using repeatability and reproducibility data for balances and glassware from measurement systems analysis methodology, balance and glassware tolerances, raw material purity, and, where applicable, eccentricity and linearity values from an accredited calibration laboratory.

MATRIX SPIKE SAMPLE DATA REPORT

GC Semivolatiles

Client Lot #...: A0B250453 **Work Order #...:** LV3JM1A8-MS **Matrix.....:** SO
MS Lot-Sample #: A0B250453-002 LV3JM1A9-MSD

SURROGATE	PERCENT RECOVERY	RECOVERY LIMITS
Tetrachloro-m-xylene	85	(70 - 125)
	85	(70 - 125)
Decachlorobiphenyl	89	(55 - 130)
	85	(55 - 130)

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Bold print denotes control parameters

Results and reporting limits have been adjusted for dry weight.

NOTE(S):

Results and reporting limits have been adjusted for dry weight.

J Estimated Result: Result is less than RL and greater than or equal to the MDL.

B Blank contamination: Target analyte was detected at a reportable level.
