1.0 INTRODUCTION

1.1 Facility Description

Past Department of Defense (DOD) activities at the Ravenna Army Ammunition Plant (RVAAP) date back to 1940 and include the manufacturing, loading, handling and storage of military explosives and ammunition. Up until 1999, the RVAAP was identified as a 21,419-acre installation. The property boundary was resurveyed by the Ohio Army National Guard (OHARNG) over a two year period 2002 and 2003 and the actual total acreage of the property was found to be 21,683.289 acres. As of February 2006, a total of 20,403 acres of the former 21,683 acre RVAAP have been transferred to the United States Property and Fiscal Officer (USP&FO) for Ohio for use by the OHARNG as a military training site. The current RVAAP consists of 1,280 acres in several distinct parcels scattered throughout the confines of the OHARNG Ravenna Training and Logistics Site (RTLS). The RVAAP and the RTLS are collocated on contiguous parcels of property and the RTLS perimeter fence completely encloses the remaining parcels of the RVAAP. The RTLS is in northeastern Ohio within Portage and Trumbull Counties, approximately 4.8 kilometers (3 miles) east northeast of the city of Ravenna and approximately 1.6 kilometers (1 mile) northwest of the city of Newton Falls (Figure 1-1). The RVAAP portions of the property are solely located within Portage County. The RTLS (inclusive of the RVAAP) is a parcel of property approximately 17.7 kilometers (11 miles) long and 5.6 kilometers (3.5 miles) wide bounded by State Route 5, the Michael J. Kirwan Reservoir, and the CSX System Railroad on the south; Garret, McCormick, and Berry roads on the west; the Norfolk Southern Railroad on the north; and State Route 534 on the east (see Figures 1-1 and 1-2). The RTLS is surrounded by several communities: Windham on the north; Garrettsville 9.6 kilometers (6 miles) to the northwest; Newton Falls 1.6 kilometers (1 mile) to the southeast; Charlestown to the southwest; and Wayland 4.8 kilometers (3 miles) to the south. When the RVAAP was operational the RTLS did not exist and the entire 21,683-acre parcel was a government-owned, contractor-operated (GOCO) industrial facility. The RVAAP Installation Restoration Program (IRP) encompasses investigation and cleanup of past activities over the entire 21,683 acres of the former RVAAP and therefore references to the RVAAP in this document are considered to be inclusive of the historical extent of the RVAAP, which is inclusive of the combined acreages of the current RTLS and RVAAP, unless otherwise specifically stated.

1.2 Project Description

In 2004 the U.S. Army and the Ohio EPA finalized the Facility-Wide Groundwater Monitoring Program (FWGWMP) Plan which details the requirements of the program. The FWGWMP was initiated in 2005 with three consecutive quarters of

FWGWMP well sampling. The first quarter of FWGWMP 2006 sampling took place in March 2006. The May 2006 sampling event represents the second quarter of 2006 FWGWMP sampling. All FWGWMP wells are to be sampled once every quarter during 2006, with the exception of the Ramsdell Quarry Landfill wells RQLmw -007, -008, and -009, and two Demolition Area 2 wells, DA2mw-DET3 and –DET4. The RQL and DA2 wells will be sampled twice a year, during the second and fourth sampling events.

Details of the program design and requirements are contained in the *RVAAP Facility-Wide Groundwater Monitoring Program Plan, Portage Environmental, September 2004*. This document contains the Sampling and Analysis, Site Safety and Health and Quality Assurance Project Plan addenda that pertain to the proposed work. Additional details pertaining to performance of field and laboratory activities are contained in the *RVAAP Facility Wide Sampling and Analysis Plan/Quality Assurance Project Plan (FWSAP)*, SAIC, March 2001. As detailed in the FWGWMPP, the initial monitoring program consists of the sampling of 36 wells specified in Table 4-1 of the FWGWMPP. Fourteen of these wells are "Background Wells" and the remainder are wells situated at various AOCs at RVAAP. The first sampling event for this project was conducted in April 2005, the second in July 2005 and the third in October 2005. The first sampling event for 2006 was conducted in March 2006. The results of these sampling events are reported in the following:

- "*Facility-Wide Groundwater Monitoring Program, Report on the April 2005 Sampling Event, Ravenna Training and Logistics Site/Ravenna Army Ammunition Plant, Ravenna, Ohio*", dated August 2005,
- "*Facility-Wide Groundwater Monitoring Program, Report on the July 2005 Sampling Event, Ravenna Training and Logistics Site/Ravenna Army Ammunition Plant, Ravenna, Ohio*", dated November 2005,
- "*Facility-Wide Groundwater Monitoring Program, Annual Report for 2005, Ravenna Training and Logistics Site/Ravenna Army Ammunition Plant, Ravenna, Ohio*", dated May 2006.
- "*Facility-Wide Groundwater Monitoring Program, Report on the March 2006 Sampling Event, Ravenna Training and Logistics Site/Ravenna Army Ammunition Plant, Ravenna, Ohio*", dated August 2006.

This report presents the results for the 2006 second quarter sampling event.

1.3 Scope of Work for the 2006 Sampling Events

SpecPro, Inc. was contracted (GSA Contract No. GS-10F-0448P) by the U.S. Army Corps of Engineers, Louisville District (USACE) to conduct the 2006 FWGWMP monitoring program. The objective of this project is to continue quarterly monitoring under the RVAAP Facility-Wide Groundwater Monitoring Program for an additional period of one (1) year, consisting of four quarterly monitoring events and related activities. The following tasks were performed in accordance with specifications contained in the FWGWMPP, the FWSAP, and the Scope of Work written by the USACE in December 2005:

Task 1. Perform groundwater sampling of select wells (36) for four consecutive quarters including the requisite IDW characterization, reporting and disposal. Sample the RQL (3 wells) and the DA2 wells (2 wells) only during two quarterly events in 2006. Obtain water level elevations in 241 on-site monitoring wells and analyze groundwater flow conditions during one of the quarterly monitoring events. For a one time event, clear brush around wells and along access pathways.

Task 2. Perform select laboratory analyses and data validation for collected samples;

Task 3. Reduce quarterly data and preparation of individual sampling event reports;

Task 4. Prepare an annual report including the overall program review requirement, and

Task 5. Perform maintenance on selected groundwater monitoring wells.

The 2006 second quarter sampling event consisted of the following subtasks:

- Inspect all RVAAP facility groundwater monitoring wells and measure groundwater levels in all RVAAP facility wells,
- Collect and analyze groundwater samples from the 41 FWGWMP wells,
- Verify, validate, and reduce the laboratory analytical data produced for the event,
- Prepare and submit a report on the sampling event.

1.4 Report Presentation

This report presents the results of the 2006 second quarter sampling event, which was performed in May 2006. The report is structured in the following way:

- Section 1.0 – Introduction
- Section 2.0 – Description of Project Activities. This section describes project-specific details not contained in the FWSAP and FWGWMPP on how the tasks described above were performed.
- Section 3.0 – Results of Investigation. The results of the second event sampling are summarized, groundwater elevation measurements, analytical results, data verification/validation information.
- Section 4.0 - References

The appendices contain the following items:

- Appendix A – Field Log Book Sheets, including daily activities, water level measurements, and purge records.
- Appendix B – Laboratory Data Sheets, including all Quality Control (QC) data and information.
- Appendix C – Data Verification/Validation Reports.

2.0 PROJECT ACTIVITIES

2.1 Groundwater Level Monitoring

Depth to water from the top of the inner casing was measured in all RVAAP facility wells on April 24 through 27, 2006. Water level measurements were taken with a Herron Dipper-T electronic water level indicator. The depth to the bottom of the well from the top of the inner casing was also measured with the electronic water level indicator. Depth to water and depth to bottom measurements and groundwater elevations for all RVAAP monitoring wells will be presented in the FWGWMP 2006 Annual report. Depth to water and depth to bottom measurements and groundwater elevations for the FWGWMP monitoring wells are presented in Table 3-1. The results of the groundwater level monitoring for the FWGWMP wells are presented in Section 3.1.

2.2 Groundwater Sampling

All wells were sampled for this event between May 1 and 4, 2006. All wells, with the exception of DA2mw-DET4, were sampled using Micropurge techniques in accordance with the specifications contained in the FWGWMPP and FWSAP. The wells were micropurged until certain groundwater parameters (temperature, specific conductivity, pH, and dissolved oxygen) had stabilized. The groundwater parameters were measured with a Horiba U-22 Flow Cell. Groundwater parameter measurements obtained during micropurging are presented Appendix A.

Groundwater samples were collected with QED micropurge equipment. Equipment and sampling details are contained in Appendix A. Groundwater samples were collected in laboratory supplied containers and stored in iced coolers for shipment in accordance with FWSAP and FWGWMPP specifications.

DA2mw-DET4 was sampled using a dedicated bailer due to the low volume of water present in the well. The well was bailed dry on May 3, 2006. Groundwater parameters (temperature, specific conductivity, pH, and dissolved oxygen) were measured with a Horiba U-22 Flow Cell and recorded in the Field Data Sheets (Appendix A). The groundwater sample from DA2mw-DET4 was collected with the dedicated bailer on May 4, 2006. Groundwater samples were collected in laboratory supplied containers and stored in iced coolers for shipment in accordance with FWSAP and FWGWMPP specifications.

2.3 Laboratory Analysis

Laboratory analyses on all regular, Quality Control (QC) and matrix spike/matrix spike duplicate (MS/MSD) samples were performed by Severn-Trent Laboratories, Inc. (STL) of North Canton, Ohio. A QC sample was collected from each of five wells: BKGmw-008, BKGmw-013, LL1mw-080, LL12mw-183, and WBGmw-006. An MS/MSD sample was collected from each of five wells: BKGmw-004, LL3mw-238, LL11mw-007, DA2mw-107, and RQLmw-008. All samples were picked up from the facility and delivered to the laboratory in iced coolers by a STL courier under proper chain-of-custody procedures (Appendix B).

Laboratory analyses on all Quality Assurance (QA) samples were performed by GPL, LLC of Frederick, Maryland. Five QA samples were collected for this sampling event: BKGmw-008, BKGmw-013, LL1mw-080, LL12mw-183, and WBGmw-006. All QA samples were shipped in iced coolers via overnight delivery service under proper chain-of-custody procedures.

All groundwater samples were analyzed for Explosives, Propellants, Cyanide, Volatile Organic Compounds (VOCs), Semi-Volatile Compounds (SVOCs), Target Analyte List Metals (filtered), Pesticides, and Polychlorinated Biphenyls (PCBs). Additionally, the groundwater samples collected from the monitoring wells at Load Line 12 (LL12mw-153, -182, -183, and -186) were analyzed for Nitrate-Nitrite.

Laboratory results are summarized in Section 3.2. Laboratory data sheets, including QA/QC information is contained in Appendix B.

2.4 Data Verification/Validation

Data from STL and GPL, LLC was verified and validated in accordance with project specifications by an independent contractor, Valerie Mariola of Mariola's Data Validation Services and using the ADR program. Data validation/verification is summarized in Section 3.3. The Data Verification/Validation Summary Reports are presented in Appendix C.

2.5 Investigation Derived Waste

Purge water was collected at each well location in 5-gallon buckets and transferred to 55-gallon drums located behind Building 1036. Drums were designated for storing purge water from each AOC, and drums were designated to store purge water from the background wells. No more than four gallons were purged from any well. Instruments and equipment were decontaminated after

purging and sampling each monitoring well. Decon fluids were collected in separate 55-gallon drums stored behind Building 1036. Pending analysis of the monitoring well samples, IDW fluids will be stored in the 55-gallon drums behind Building 1036 until project completion and final disposal in accordance with FWSAP requirements.

3.0 RESULTS

3.1 Groundwater Elevations

Groundwater elevations for all RVAAP monitoring wells were obtained between April 24 and 27, 2006 as described in Section 2.2. The groundwater elevations for the FWGWMP wells are presented in Table 3-1. The results for all RVAAP monitoring wells measured in April 2006 will be presented in the FWGWMP 2006 Annual Report. A single facility-wide groundwater potentiometric map based on groundwater measurements taken in April 2006 will also be presented in the 2006 Annual Report.

3.2 Summary of Analytical Results

Summaries of laboratory analytical results are presented in Tables 3-2, 3-3, 3-5, 3-6, and 3-7. Compounds and elements that were detected are presented in bold numbers. Appendix B presents the Laboratory Data Sheets. A brief summary of the detected compounds and elements are presented in the following sub-sections. The data presented in the tables is the validated and verified data. Data verification and validation is discussed in Section 3.3 and Appendix C.

3.2.2 Inorganic Elements

Inorganic elements analytical results are presented in Table 3-3. The only inorganics detected in the samples included: antimony, beryllium, lead, silver and vanadium. The inorganic elements that were detected were compared to facility-wide background levels, and against elements that are considered as essential nutrients to determine if they are to be considered as Site Related Contaminants (SRCs). Calcium, magnesium, iron, potassium, and sodium were eliminated as potential SRCs because they are considered as essential nutrients. Background levels for inorganic elements are presented in Table 3-4. The inorganic elements that were detected were compared to the appropriate background criteria to determine if they were SRCs. Elements not detected include beryllium, lead, mercury, selenium, and silver. Inorganic constituent results presented below that are qualified with a "J" indicate that the result is estimated. The following inorganic elements were detected above the appropriate background levels:

3.3 Data Verification/Validation

All data received from STL and GPL was verified and greater than 10% of the data validated. The verification/validation reports for the data are presented in Appendix C. The data was validated using a data validator and the ADR software supplied by the USACE. Data has been validated consistent with the programmed criteria of the ADR software.

Forty-one wells were sampled during a four day sampling event from May 1, 2006 through May 4, 2006. During this event, six trip blanks were submitted for volatile analysis to both STL and GPL. Several low level contaminants including methylene chloride, acetone, 2-butanone, 4-methyl-2-pentanone, and toluene were detected in one or more of the trip blanks submitted. In most cases these compounds were not detected in any associated field samples, therefore data was not qualified.

Six field duplicates were collected on two separate days in order to assess the quality and consistency of sample collection. Project requirements of 10% field duplicates were met for this sampling event. In addition, four laboratory splits were collected and analyzed on two days of sampling in order to assess the quality and consistency of the laboratory analysis. The project requirements of taking 10% laboratory splits were met for this sampling event.

An equipment rinse blank was collected during the sampling event. Positive values of carbon disulfide and calcium were detected in the equipment rinse blank. These values were qualified throughout all samples collected during this event based on standard blank contamination guidelines established by the USACE Louisville Guidance Document.

Laboratory analyses were performed in analytical batches in order to maximize efficiency and group quality control requirements. Method blanks, laboratory control samples, and laboratory control duplicates were analyzed at a frequency of 1:20 (5%) samples, or in each analytical batch whichever was greater. Sufficient volume was provided to the laboratory in order to assess matrix spike analysis on project samples at a frequency of 1:10 (10%) samples. Matrix spike/matrix spike duplicate analysis was performed by the laboratory as batch quality control at a frequency of 1:10 (10%).

Field quality control and laboratory quality control results were evaluated as part of the verification and validation assessment provided in Appendix C. Project requirements were met for the frequency and quality of these samples. Samples have been appropriately identified as trip blanks, field duplicates, and splits in the ADR software, and evaluation of these samples was performed by the validator as well as the ADR software.

All qualified data has been discussed in the Data Verification/Validation Reports contained in Appendix C. Data have been qualified estimated in one or more delivery groups due to method blank contamination, low LCS percent recoveries, low MS/MSD percent recoveries, and greater than 40%D in the confirmation of compounds detected using a GC instrument.

Several semi-volatile samples were re-analyzed due to poor surrogate recoveries. The samples were re-extracted and had acceptable surrogate recovery however; the analysis was performed after the 7 day holding time requirement. The re-analyzed results have been qualified R due to holding time exceedances.

Many samples have rejected values for SVOCs (including hexachlorocyclopentadiene and benzoic acid) due to poor LCS recovery as discussed in Appendix C. There are 66 compounds which are simultaneously analyzed for SVOCs. Occasionally one or more SVOCs are rejected for LCS recovery, which must be greater than 30% to comply with ADR guidelines. Typically between 60 to 64 compounds consistently pass with acceptable LCS percent recoveries. The test method itself consistently has problems with hexachlorocyclopentadiene and benzoic acid passing with acceptable LCS percent recoveries. The protocol for situations when LCS recoveries are not acceptable is to re-extract and re-analyze the sample. Unfortunately in most cases the 7-day holding time for this analysis has been exceeded by the time it becomes apparent that re-analysis is needed. The samples were not re-analyzed because all 66 compounds would be rejected by the ADR program (which is based on USACE Louisville Chemical Guidelines) because of holding times exceedances, even if the LCS recoveries were acceptable in the re-analysis. Therefore, the results of the initial analysis (with several SVOC compounds rejected due to poor LCS percent recoveries) are presented in this report rather than a re-analysis of the SVOCs , which would have had all SVOC compounds rejected due to holding time exceedances.

The lab incorrectly prepared the pesticide LCS and MS spiking solution at a concentration which exceeds the linear range of the instrument. This solution had been used throughout this four day sampling event. In many cases elevated LCS and MS percent recoveries were reported for all pesticide compounds. Corrective action has been taken at the lab; however, no data was qualified based on this.

All qualified data is further discussed in the Data Verification/Validation Reports contained in Appendix C.

MS/MSD analysis performed on sample FWGRQLmw-008C-0247-GW from analytical batch 6128234 had percent recoveries outside of control limits for vinyl chloride (85%,84% [88—126%]), bromodichloromethane (77%, 76% [80-146%]), cis-1,3-dichloropropene (79%, 79% [82-130%]), dibromochloromethane (66%, 70% [71-158%]), and bromoform (57% [58-176%]). No data was qualified based on MS/MSD percent recoveries.

Low LCS recovery was reported for carbon tetrachloride (69% [75-149%]), bromodioromethane (81%[87-130%]), dibromochloromethane (71%[81-138%]), bromoform (62% [76-150%]) in batch 6128234. All sample results in the associated batch have been qualified estimated (J/UJ).

Methylene chloride (11 ug/L), Acetone (13 ug/L), and toluene (0.24 J ug/L) were detected in the trip blank. All samples had undetectable levels of these compounds, therefore no data was qualified based on this.

SEMI-VOLATILES (EPA 8270C, Prep method 3520)
The following were reviewed and found acceptable:

- Holding times, preservation, sample handling
- Tuning criteria
- Initial Calibration Criteria including SPCC and CCC compounds

Low surrogate recovery of 2-fluorophenol (19-108%) was reported for sample FWGBKGmw-012C-0213-GW (15%) and for the spike performed on sample FWGRQLmw-008C-0247-GW (17%). The remaining five surrogates were acceptable for these samples. No data was qualified based on one acid phenol surrogate out of acceptable limits.

Low LCS recovery was reported for benoic acid (6% [10-127%]) in analytical batch 6125042. Low LCS recovery was reported for hexachlorocyclopentadiene (4% [10-95%]), and benzoic acid (8% [10-127%]) in analytical batch 6128050. These low LCS recoveries are both lower than the LCL and rejection criteria of 30%. Results for these two compounds have been rejected (R) in all associated samples in the analytical batch.

Low MS/MSD percent recoveries were reported in the MS performed on sample FWGRQLmw-008C-0247-GW for 1,4-dichlorobenzene (27%, [32-98%]), 2-chlorophenol (33%, [37-106%]), bis(2-chloroethoxy)methane (53%, [57-114%]), 2,2'-oxybis (51% [53-122%]), 2-chloronaphthalene (50% [51-119%]), 1,2-dichlorobenzene (31% [43-112%]), 1,3-dichlorobenzene (29%[35-114%], 3,3'-dichlorobenzidine (0%, 0% [19-111%]), hexachlorobutadiene (27%[35-118%]), hexachlorocyclopentadiene (9%[10-95%]), naphthalene (44%[50-175%]), nitrobenzene (53% [56-125%]), 2-nitrophenol (48%[51-131%]), and caprolactam (202%, 229% [30-120%]). Data was not qualified based on MS/MSD data alone.

Elevated RPD values were also reported for 1,2,4-trichlorobenzene (40%), n-nitrosodi-n-propylamine (37%), 1,4-dichlorobenzene (56%), phenol (52%), 2-chlorophneol (56%), benzaldehyde (44%), acetophenone (41%), and 1,1-biphenyl (26%). Since all associated samples had undetectable levels of these compounds no data was qualified based on elevated MS/MSD RPD values.

PESTICIDES (EPA 8081A, Prep method 3520)
The following were reviewed and found acceptable:

- Holding times, preservation, sample handling
- Instrument performance, Breakdown criteria
- Initial Calibration Criteria
- ICV 2nd source and MRL criteria
- CCV criteria

- Surrogate percent recoveries
- MS/MSD RPD values
- The method blank was free from contamination

Elevated surrogate recovery was reported for tetrachloro-m-xylene (145%[39-130%]) in sample FWGLL2mw-263C-0227-GW. This sample had undetectable levels of all pesticides. Other samples mainly the LCS and MS/MSDs were diluted and brought the concentration of surrogate spike compounds out of detectable range of the instrument. No data was qualified based on this.

Elevated LCS percent recoveries were reported for all compounds in the LCS which ranged from 177% to 471% recovery. It appears that the spiking solution was improperly prepared by the laboratory. Since all samples had undetectable levels of pesticides, no data was qualified based on this.

Low MS/MSD percent recoveries were reported in the MS performed on sample FWGRQLmw-008C-0247-GW which ranged from 5% -12% in the MS and from 5% - 13% in the MSD. In another QC MS/MSD spiked sample from another project, elevated MS recoveries were reported for all compounds which ranged from 115% to 494% and MSD recoveries ranged from 122% - 562%. All samples were diluted at a 10x range to bring the concentration of spike solution within range of the instrument. It appears that these samples may have suffered from the same spiking solution preparation error that was used in the LCS. The dilution is what caused one spike to be elevated, and the other to be low. No data was qualified based on this.

PCBs (EPA 8082, Prep method 3520)
The following were reviewed and found acceptable:
- Holding times, preservation, sample handling
- Initial Calibration Criteria

- Holding times, preservation, sample handling
- Initial Calibration Criteria
- MRL criteria
- Confirmation of positive values using second column
- Surrogate recoveries
- LCS percent recoveries
- The method blank was free from contamination
- The filter blank was free from contamination

Due to high solid content, several samples were filtered prior to analysis. A filter blank was prepared and analyzed with this analytical batch. No contamination was noted on the filter blank.

Positive values reported for explosives have been confirmed on two columns. In one sample, results for 1,3,5-Trinitrobenzene have been qualified (P) due to a greater than 40% D between the original column and the second confirmation column.

Low MS/MSD percent recoveries were reported in the MSD performed on sample FWGRQLmw-008C-0247-GW 2-amino-4,6-dinitrotoluene (79%[82-125%]), 4-amino-2,6-dinitrotoluene (79%[85-123%]), 1,3-dinitrobenzene (87%[89-130%]), 2,4-dinitrotoluene (86%, [86-128%]), 2,6-dintrotoluene(80% [86-127%]), 2-nitrotoluene (83% [90-120%]), 3-nitrotoluene (80% [87-122%]), 4-nitrotoluene (83% [87-124%]), RDX (78% [94-124%]), tetryl (80% [81-126%]), 1,3,5-trinitrobenzene (77% [81-132%]), and 2,4,6-trinitrotoluene (86%[86-126%]). Positive results for 1,3,5-trinitrobenzene have been qualified estimated, all other compounds had undetectable levels at the standard reporting limit, and no further data has been qualified based on low MSD percent recoveries.

Elevated RPD values were reported for many of the same compounds reported above due to low MSD percent recoveries and acceptable MS percent recoveries. All compounds with elevated RPD values had undetectable levels of explosives, therefore no data was qualified based on these elevated RPD values which were between 16 and 23%.

METALS (EPA 6010B, 6020, 7470A,Prep method 3010)

- ICB criteria
- CCV and CCB criteria
- Interference check compounds (ICSA) criteria
- LCS percent recoveries
- Serial dilution criteria
- Post digestion spike criteria

MS percent recoveries were not reported for iron due to the concentration of iron in the sample relative to the spiking concentration of iron used (4x rule). No data was qualified based on this.

Elevated RPD values were reported in the sample duplicate for selenium and nickel. Concentrations of these compounds in the sample were less than 5x the reporting limit and therefore, within acceptable reproducible levels. No data was qualified based on this.

Low surrogate recovery of 2-fluorobiphenyl was reported in three samples in this analytical batch with recoveries of 17% for all three samples [19-108%]. Since the other five surrogate recoveries were within acceptable limits, no data was qualified based on this.

Low LCS recovery was reported for benzoic acid (8%) and hexachlorocyclopentadiene (4%) which are both lower than the LCL and rejection criteria of 30%. Results for these two compounds have been rejected (R) in all associated samples in the analytical batch.

Low MS/MSD percent recoveries were reported in the MS performed on sample FWGLL3mw-238C-0228-GW for 3,3-dichlorobenzidine (16%, 14% [30-160%]), n-nitrosodiphenylamine (46%[49-117%]). The spiked sample has been qualified estimated for these compounds.

PESTICIDES (EPA 8081A, Prep method 3520)
The following were reviewed and found acceptable:

- Holding times, preservation, sample handling
- Instrument performance, Breakdown criteria
- Initial Calibration Criteria
- ICV 2nd source and MRL criteria

- The method blank was free from contamination

Low surrogate recovery was reported for sample FWGWBGmw-006C-0243-GW for tetrachloro-m-xylene (9.5% [39-130%]), and for decachlorobiphenyl (9.1% [10-147%]). The sample was re-extracted and re-analyzed with elevated recoveries of 204% and 159% respectively.

Due to concentrations of pesticides in several samples, dilutions were performed to bring concentrations within the linear range of the instrument. Several surrogates have been qualified (D)- diluted out due to these standard laboratory practices.

Positive results have been confirmed on a secondary column. If a greater than 40% difference between the primary and confirmation column exists, the results have been qualified P.

Elevated LCS percent recoveries were reported for all compounds in the LCS which ranged from 177% to 471% recovery in analytical batch 6126060. Elevated LCS percent recoveries were also reported in batch 6126063 with recoveries ranging from 184% - 497%. Acceptable LCS and LCSD percent recoveries were reported for analytical batch 6136022. It appears that the spiking solution was improperly prepared by the laboratory.

Low MS/MSD percent recoveries were reported in the MS performed on a site specific sample from another delivery group which ranged from 5% -12% in the MS and from 5% - 13% in the MSD. In another QC MS/MSD spiked sample from another project, elevated MS recoveries were reported for all compounds which ranged from 115% to 494% and MSD recoveries ranged from 122% - 562%. All samples were diluted at a 10x range to bring the concentration of spike solution within range of the instrument. It appears that these samples may have suffered from the same spiking solution preparation error that was used in the LCS. The dilution is what caused one spike to be elevated, and the other to be low. No data was qualified based on this.

- LCS percent recoveries
- MS/MSD RPD values
- The filter blank was free from contamination

Due to high solid content, several samples were filtered prior to analysis. A filter blank was prepared and analyzed with this analytical batch. No contamination was noted on the filter blank.

Due to concentrations of pesticides in several samples, dilutions were performed to bring concentrations within the linear range of the instrument. Several surrogates have been qualified (D)- diluted out due to these standard laboratory practices.

Method blank contamination was reported in batch 6127042 for 4-amino-2,6-dinitrotoluene (0.056 ug/L), HMX (0.089 ug/L), nitrobenzene (0.061 ug/L), and 3-nitrotoluene (0.072 ug/L). All samples associated with this analytical batch have had these compounds qualified (B) found in blank at concentrations within 5 times the values found in the blank.

MS/MSD percent recoveries could not be calculated due to the concentration of explosives initially in the sample relative to the spiking concentration and the subsequent dilution necessary to bring the concentration of explosives within linear range of the instrument.

Low surrogate recovery of 2-fluorobiphenyl was reported in three samples in this analytical batch with recoveries of 17% for all three samples [19-108%]. Since the other five surrogate recoveries were within acceptable limits, no data was qualified based on this.

Low LCS recovery was reported for benzoic acid (8%) and hexachlorocyclopentadiene (4%, 2%) which are both lower than the LCL and rejection criteria of 30%. Results for these two compounds have been rejected (R) in all associated samples in the analytical batch.

Low MS/MSD percent recoveries were reported in the MS performed on batch QC sample for 3,3-dichlorobenzidine (16%, 14% [30-160%]) and n-nitrosodiphenylamine (46%[49-117%]). No data was qualified based on this. MS/MSD percent recoveries were reported outside of lab QC limits in the MS performed on FWGWBGmw-009C-0245-GW for hexachlorocyclopentidiene (5%, 5%), 1,2-dichlorobenzene (42% [43-112%]), and caprolactam (568%, 557%). Due to concentrations of pesticides in several samples, dilutions were performed to bring concentrations within the linear range of the instrument. Several surrogates have been qualified (D)- diluted out due to these standard laboratory practices.

Positive results have been confirmed on a secondary column. If a greater than 40% difference between the primary and confirmation column exists, the results have been qualified P.

Elevated LCS percent recoveries were reported for all compounds in batch 6126063 with recoveries ranging from 184% - 497%. Elevated LCS percent recoveries were reported for 4,4'-DDD (145% [56-144%]), and endosulfan sulfate (136%[62-126%]) in batch 6129025. It appears that the spiking solution was improperly prepared by the laboratory for the first analytical batch. Positive results in batch 6129025 have been qualified estimated for these two compounds.

The MS/MSD spiked sample, FWGWBGmw-009C-0245-GW had elevated MS/MSD percent recoveries were reported for all compounds which ranged from 185% to 468% and MSD recoveries ranged from 228% - 445%. In another analytical batch with batch QC, MS recoveries were from 180% - 481% while MSD were between 201% - 508%. All samples were diluted at a 10x range to bring the concentration of spike solution within range of the instrument. It appears that these samples may have suffered from the same spiking solution preparation error that was used in the LCS. No data was qualified based on this.

Low surrogate recovery of 2-fluorobiphenyl was reported in four samples in this analytical batch with recoveries of 16%, 1.8%, 17%, and 1.6% [19-108%]. Since the other five surrogate recoveries were within acceptable limits for three of these samples, no data was qualified based on this. Sample FWGBKGmw-006-0210-GW had low recovery of 2,4,6-tribromophenol as well (34% [42-124%]). This sample was re-extracted and reanalyzed with acceptable percent recoveries for all surrogates. However this extraction took place outside of holding time. The re-analyzed sample results have been reported for this project.

Low LCS recovery was reported for hexachlorocyclopentadiene (2%, 1% , 7%) and benzoic acid(4%) which is lower than the LCL and rejection criteria of 30%. Results for these compounds have been rejected (R) in all associated samples in the analytical batch. Low LCS recovery was also reported for 1,2-dichlorobenzene (39% [44-110%]), 1,3-dichlorobenzene (34% [38-110%]), hexachlorobutadiene (26% [36-113%]), and hexachloroethane (27% [28-94%]). Results for these compounds have been qualified estimated (J/UJ) in all associated samples in the analytical batches. Elevated LCS recovery was reported for bis (2-ethylhexyl)phthalate (152%, 128%, [49-124%]). No data was qualified based on elevated LCS criteria since associated samples had undetectable levels of this compound.

MS/MSD percent recoveries were reported outside of lab QC limits in the MS performed on batch QC sample from batch 6130053 for hexachlorocyclopentidiene (5%, 5%), 1,2-dichlorobenzene (42% [43-112%]), and caprolactam (568%, 557%). No data was qualified based on batch QC results.

Bis(2-ethylhexyl)phthalate was detected in both method blanks (1.5 ug/L J, and 2.4 ug/L J) and diethylphthalate (0.064 ug/L J) was detected in one. Concentrations of these compounds within 5 times the value found in the method blank have been qualified (B) found in the blank based on these results.

Positive results have been confirmed on a secondary column. If a greater than 40% difference between the primary and confirmation column exists, the results have been qualified P.

Elevated LCS percent recoveries were reported for 4,4'-DDD (145% [56-144%]) and endosulfan sulfate (136%[62-126%]). Positive results in batch 6129025 have been qualified estimated for these two compounds. Elevated LCS percent recoveries were reported for all compounds in batch 61299045 with recoveries ranging from 180% - 486%. It appears that the spiking solution was improperly prepared by the laboratory for this analytical batch. No data was qualified based on this.

The MS/MSD spiked sample FWGDA2mw-107C-0240-GW had MS recoveries from 180% - 481% while MSD percent recoveries were between 201% - 508%. All samples were diluted at a 10x range to bring the concentration of spike solution within range of the instrument. It appears that these samples may have suffered from the same spiking solution preparation error that was used in the LCS. No data was qualified based on this.

Method blank contamination was reported for antimony (7.9 ug/L B) and manganese (0.58 ug/L B) at values less than ½ the reporting limit. No data was qualified based on this. Values less than the reporting limit in all associated samples have already been qualified estimated (B) at a value less than the standard reporting limit.

Elevated RPD values were reported for aluminum, antimony, and nickel in the sample duplicate. Values detected in one aliquot were estimated values less than the reporting limit while the second aliquot had undetectable levels of these compounds. Because values were within 5x the reporting limit, no data was qualified based on this.
