1. INTRODUCTION

Science Applications International Corporation (SAIC) conducted a Phase I Remedial Investigation (RI) of High Priority Areas of Concern (AOCs) at the Ravenna Army Ammunition Plant (RVAAP), in Ravenna, Ohio, in support of RVAAP's Installation Restoration Program. The Phase I RI was performed for the U.S. Army Corps of Engineers (USACE), Nashville District, under Contract DACA62-94-D-0029, Delivery Orders Nos. 0010 and 0022. The Phase I RI was conducted in compliance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and work plans reviewed and commented on by the Ohio Environmental Protection Agency (OEPA).

Investigative activities conducted during the Phase I RI resulted in the generation of investigation-derived waste (IDW) consisting of soil, sediment, water, and spent personal protective equipment (PPE). The IDW was generated in the course of drilling, sampling, and equipment decontamination activities. The objectives of this plan are to characterize the IDW for future management and disposal. The plan includes a summary of the IDW generated and its origin (Section 2); an overview of the current IDW management (Section 3); the analytical results available for waste characterization (Section 4); and classification of the IDW and recommendations for disposal (Section 5). This document has been revised pursuant to comments provided by the OEPA in letters dated February 10, 1997 and August 5, 1997. In addition, appropriate revisions have been made to this document pursuant to the guidance issued by the OEPA (November 1997) to the U.S. Army regarding IDW disposition.

2. OPERATIONAL HISTORY AND WASTE GENERATION

Eleven high-priority AOCs were investigated during the Phase I RI at RVAAP. These AOCs are as follows:

- Demolition Area #2 (RVAAP-04),
- Winklepeck Burning Grounds (RVAAP-05),
- Load Line 1 and Dilution/Settling Pond (RVAAP-08),
- Load Line 2 and Dilution/Settling Pond (RVAAP-09),
- Load Line 3 and Dilution/Settling Pond (RVAAP-10),
- Load Line 4 and Dilution/Settling Pond (RVAAP-11),
- Load Line 12 and Dilution/Settling Pond (RVAAP-12),
- Building 1200 and Dilution/Settling Pond (RVAAP-13),
- Load Line 12 Pink Wastewater Treatment Plant (RVAAP-18),
- Landfill North of Winklepeck Burning Grounds (RVAAP-19), and
- Upper and Lower Cobbs Ponds (RVAAP-29).

Information regarding the operational history and suspected contaminants at the eleven AOCs is presented in Section 1 of the *RVAAP Phase I RI Sampling and Analysis Plan (SAP) Addendum* (USACE 1996a). The investigative activities conducted at each AOC are presented in the *Phase I RI SAP Addendum* along with the sampling methods and procedures. The *Phase I RI SAP Addendum* is tiered under the *RVAAP Facility-wide SAP* (USACE 1996b), which contains additional investigative methods and procedures used for sampling and managing IDW at RVAAP.

Soil, sediment, water (groundwater and decontamination soap and rinse water), and spent PPE IDW generated during the Phase I RI are listed, by container, in Table 2-1.

3. MANAGEMENT OF ENVIRONMENTAL MEDIA

All environmental media were managed in a manner that minimized potential risk to human health and the environment and as nonhazardous materials pending waste characterization and classification based on analytical results. The *Facility-Wide SAP* (USACE 1996b) and the *Phase I RI SAP Addendum* (USACE 1996a) contain the procedures used for containerizing and handling IDW.

3.1 SOILS

Excess soil and rock cuttings from monitoring well boreholes (> 4 feet) were segregated by borehole, additionally, on the basis of unsaturated or saturated (groundwater) materials. Excess soil from surface soil sampling stations and shallow (<4 ft) soil borings were segregated by AOC. All soil IDW was placed in lined, open-top 55-gallon drums and the container was labeled to indicate a description of the medium (e.g., soil, sediment, PPE), the origin of the material, the starting and ending dates that material was placed in the container, and other pertinent information as noted in Table 2-1. The containers were additionally marked using a paint pen or other indelible marker to indicate the container number and origin. Each container was sealed after soil was placed in it and was kept closed except when wastes were being added to the containers to prevent the introduction of rainwater. At the end of field activity, all containers were sealed using the manufacturer's bung-top lid.

Soil drums were staged within the AOC where they were generated in designated field staging areas located near the entrance of each AOC. All containers were placed on wooden pallets to reduce contact with standing water and covered with plastic sheeting, where necessary, to protect them from exposure to weather.

3.2 SEDIMENT

Excess sediment from sampling stations was segregated by AOC and placed in lined, open-top 55-gallon drums. Excess sediment from sampling stations collected within an AOC were commingled to fill the drums. As IDW was placed in a drum, the container was labeled to indicate a description of the medium (e.g., soil, sediment, PPE), the origin of the material, the starting and ending dates that material was placed in the container, and other pertinent information as noted in Table 2-1. The containers were marked using a paint pen or other indelible marker to indicate the container number and origin. Each container was sealed after sediment was placed in it and was kept closed except when wastes were being added to it to prevent the introduction of rainwater. At the end of field activity, all containers were sealed using the manufacturer's bung-top lid.

Sediment drums were staged within the AOC where they were generated in designated field staging areas located near the entrance of each AOC. All containers were placed on wooden pallets to reduce contact with standing water and covered with plastic sheeting, where necessary, to protect them from exposure to weather.

Excess sediment from subaqueous settling pond sampling stations was placed back in the pond at the conclusion of the sampling event. These wastes were not containerized because the amount generated (<0.5 lb/sample) was very small and was no greater than the amount of sediment

resuspended in water from retrieving the sample; therefore, the sediment sampler was washed clean with native water at each sampling point allowing re-sedimentation of wastes.

3.3 GROUNDWATER

Excess groundwater from monitoring well development and purging was segregated by the monitoring well from which it was generated and placed into unlined, closed-top 55-gallon drums. As the water was placed in a drum, the container was labeled to describe the medium, the origin of the material, and the dates that material was placed in the container, as well as other pertinent information. All containers were marked using a paint pen or other indelible marker to indicate the container number and origin. At the end of field activity, all containers were sealed using manufacturer's drum caps. Each container was sealed after water was placed in it and kept closed to prevent the introduction of rainwater to the drums. Drums were initially staged at each monitoring well location on wooden pallets, but at the conclusion of sampling activities, the drums were moved to a designated field staging areas within the AOC from which they were generated (Load Lines 1 and 2). All containers were placed on wooden pallets to reduce contact with standing water and covered with plastic sheeting, where necessary, to protect them from exposure to weather.

3.4 DECONTAMINATION FLUIDS

All decontamination wash and rinse liquids were segregated by waste stream and containerized in unlined, closed-top 55-gallon drums. This includes fluids generated in the course of decontamination of drilling equipment as well as decontamination of hand-held sampling equipment. Labels affixed to the drums as they were being filled describe the medium, the origin of the material, and the start and end dates that material was placed in the container. All drums were marked with a paint pen or other indelible marker to indicate the container number and origin. At the end of field activity, all containers were closed to prevent the introduction of rain water to the drums. All drums were initially staged at Building 1047.

Rinse water from the hydrochloric acid rinse of sampling equipment during decontamination are staged in separate unlined, closed-top, labeled drums inside Building 1037. Wash and rinse water from sediment sampling equipment were segregated from soil and groundwater sampling decontamination IDW and containerized in unlined, closed-top 55-gallon drums that are also staged inside Building 1047. These drums were sampled on August 23, 1996 to characterize the waste for disposal.

At the conclusion of field activities, decontamination wash and rinse IDW from soil sampling equipment were commingled from drums (Table 2-1) into a single 1000-gallon polyethylene holding tank that is staged inside the Load Line 12 Pink Wastewater Treatment Plant. This tank contains approximately 495 gallons of liquid decontamination IDW and rests on a wooden skid within a containment structure. A label affixed to the tank describes the contents, generation dates, and the origin of the contents. Decontamination IDW from groundwater sampling equipment is staged in Building 1047. This tank was sampled on August 23, 1996 to characterize the waste for disposal.

3.5 CONTAMINATED PPE

One lined, open-top 55-gallon drum of spent PPE, plastic sheeting, rope, and other solids was generated during Phase I RI. The drum was labeled to describe its contents, the start and end dates of waste generation, and the origin of the waste. A paint pen or indelible marker was used to label the drum. This drum is staged inside Building 1047.

4. DISCUSSION OF ANALYTICAL RESULTS

Per Section 7.4 of the *Facility-Wide SAP* (USACE 1996b), the analytical results from environmental samples collected during Phase I RI are used, where possible, to characterize IDW for each sampling medium. For example, analytical results from the sampling of ditch sediments will be used to characterize the drums containing correlative sediment IDW for waste classification. Saturated soils and purge or development groundwater from monitoring wells will be characterized based on the analyses of groundwater samples collected from each well. Where correlative environmental samples do not exist, waste characterization samples were collected. In the case of unsaturated soils and rock cuttings generated from monitoring well drilling, these materials are classified as non-hazardous and non-contaminated based on composite waste samples collected by SAIC during May 1997 and analyzed for TCLP Metals and Explosives. Samples were also collected from segregated decontamination IDW waste containers. The IDW characterization results are presented in Appendix A. Only the analytical results detected above method detection limits are presented in Appendix A, except for waste samples collected during May 1997 where analytical results are reported on Laboratory Form 1 CLP data sheets.

Appendix A presents the frequency of detects, minimum detected value, maximum detected value, and average value for IDW analyses. Note that the average value is calculated from all reported values, either the detected concentration or, if not detected, the quantitation limit for that sample. For analyses that include nondetects, the average represents an upper bound on the true average. Because quantitation limits vary between samples, the calculated average may exceed the maximum detect in cases where nondetects are included. For example, consider anthracene for drum LL12-10: reported values are 940 U (a nondetect) in L12sd-026(d)-0337-sd and 350 J in L12sd-028(d)-0339-sd, making the maximum detect = 350 and the average = 645.

Because surface soil and sediment drums contain IDW from several boring locations within an AOC, minimum, maximum, and mean concentrations from all samples contained in each drum are presented for characterization of the wastes in each container.

5. RECOMMENDATIONS FOR DISPOSAL

Table 7-1 of the *Facility-Wide SAP* (USACE 1996b) shows the maximum concentration of contaminants for the toxicity characteristic for hazardous wastes per 40 CFR 261.24. Analytical results for the IDW are compared with these criteria to determine whether the wastes are potentially hazardous or non-hazardous.

For the characterization of wastes (e.g., soils, sediments, etc.) as non-hazardous or hazardous, the Resource Conservation and Recovery Act (RCRA) regulatory limit will be compared to the mean contaminant level as presented in Appendix A. Although the analysis conducted on the

materials was a total analysis, the Toxicity Characteristic Leaching Procedure (TCLP) methodology will be used for waste classification by applying a twenty-fold dilution factor to total results for comparison to TCLP. For purposes of hazardous waste determination, if a given analyte is found to exceed 20 times the regulatory limit, it is being considered a RCRA-hazardous waste due to the dilution factor inherent in the TCLP method for solid materials. Analytical results for liquids were directly compared to the regulatory limits to determine hazardous waste applicability.

A portion of the contaminants found within the soils and sediments at the facility are also found listed in 40 CFR 261.33(f) and when unused are considered listed hazardous wastes. Activities at the facility included blending of materials for the purpose of manufacturing munitions. It is unknown whether the materials found within the soils and sediments were derived from the mixed compound or from separate individual use. In addition, materials were used as chemical intermediates within a manufacturing process to produce military specification munitions, as such it is unclear whether these process residuals have in fact been used and no longer meet the listing criteria of 40 CFR Part 261 for unused commercial chemical products or intermediates. It is recognized that even if this is the case, it is not possible to determine whether materials resulted from process releases before, during, or after the manufacturing process making the determination of the waste listing application unclear. It is because of these uncertainties that the approach used was to base all IDW characterization on TCLP results.

In addition to the RCRA concern, low levels of polychlorinated biphenyls (PCBs) were detected in some samples at less than 10 ppm (most samples were less than 1 ppm PCBs). Due to limitations regarding facility history it was not possible to clearly identify the source(s) of the PCB contamination to determine whether the material is subject to Toxic Substances Control Act (TSCA) for disposal as a PCB waste. As such, the analytical results are being used for TSCA characterization. As no results exceeded the 50 ppm limit, the IDW is not considered a TSCA waste. Non-RCRA and non-TSCA IDW are also classified as contaminated or non-contaminated on the basis of elevated levels of contaminants detected above analytical method detection limits (organics) or background levels (inorganics). IDW exceeding these levels are classified as contaminated. Recommendations for disposal have been revised to reflect the most recent guidance provided by the OEPA in a letter dated November 3, 1997, to the U.S. Army regarding IDW disposition.

5.1 SOILS

As previously discussed, excess soils were generated as a result of the monitoring well installation and from locations where surface soil samples were collected. The results of correlative environmental samples were used to characterize soil IDW where possible. Where no correlative environmental soil samples existed (e.g., monitoring well soil IDW), waste samples were collected to characterize IDW.

IDW Soil Hazardous Waste Determination and Disposal

Utilizing the criteria from 40 CFR Part 261, three drums of soil generated during the sampling activities exceed the regulatory limit (based on total analysis) for lead (drums LL1-001, LL12-01, and LL3-001). These drums of materials are tentatively classified as hazardous waste (D008) and are recommended for disposal accordingly. Prior to disposal, it is recommended that RCRA TCLP testing be performed in conjunction with the permitted disposal facility to ensure appropriate

classification and disposal of these wastes. It is recommended that compatible RCRA wastes be commingled so as to reduce the number of partially filled containers requiring disposal. Applicable waste codes must appear on all hazardous waste containers.

IDW Contaminated Soil Determination and Disposal

In addition to determining whether IDW should be considered a hazardous waste, analytical data were compared to background values for metals and reviewed to identify other contaminants that would cause the wastes to be classified as contaminated. Background soil concentrations established during the Phase I RI were used for comparison and are presented in Appendix B of this document for reference. Drums found to be contaminated due to the presence of explosives or metals that exceeded background values include B12ss-01, DA2-001, DA2-002, LL4-001, LL2-001SO, LNWtr-001, LL1mw-63-01A, LL1mw-63-02, WBG-002, and WBG-001SO. It is recommended that these wastes be disposed either (1) at an appropriate permitted facility or (2) temporarily stored on site pending treatment in conjunction with AOC remediation. Under OEPA (November 1997) guidance, Option 2 is only available where an AOL is to be remediated.

IDW Non-Hazardous and Non-Contaminated Soil Determination and Disposal

Soil IDW was classified as non-hazardous and non-contaminated using the previously outlined characterization methods. In accordance with OEPA (November 1997) guidance, it is recommended that all non-hazardous and non-contaminated soil IDW be permanently stored at RVAAP by spreading, seeding, and mulching.

5.2 SEDIMENT

Similar to soil sampling, IDW was generated as a result of sediment sampling. Analytical results were compared to the TCLP regulatory limits found in 40 CFR Part 261 for the purpose of determining if the material should be considered a potential hazardous waste.

IDW Sediment Hazardous Waste Determination and Disposal

Analytical data indicate that elevated levels of lead are present in one drum (LL1-002). As such, these materials are considered as the RCRA characteristic hazardous waste D008 and are recommended for disposal, accordingly, at a hazardous waste disposal facility. Prior to disposal, it is recommended that RCRA TCLP testing be performed in conjunction with the disposal facility to ensure appropriate classification and disposal of these wastes. It is recommended that hazardous sediment IDW be commingled with compatible hazardous soil IDW to reduce the number of partially filled containers requiring disposal. Applicable waste codes must appear on all hazardous waste containers.

5.3 GROUNDWATER

A review of the analytical data from groundwater sampling activities indicated that no regulatory criteria for RCRA-hazardous waste determinations were exceeded. As such, liquid IDW and saturated soil from each monitoring well are classified as non-hazardous. Furthermore, the analytical results indicate that these wastes are non-contaminated except for trace volatile and semi-

volatile organics in some samples. Liquid IDW is recommended for disposal through the RVAAP wastewater treatment plant. Saturated soil IDW is recommended for disposal either (1) at an appropriate permitted facility; or (2) temporarily stored on site pending treatment in conjunction with AOC remediation; or (3) permanently stored at RVAAP by spreading, seeding, and mulching.

5.4 DECONTAMINATION FLUIDS

Waste samples collected from decontamination fluids (soil and sediment wash/rinse water) indicated all analytes are well below the 40 CFR 261.24 maximum concentration for toxicity characteristic and, therefore, are classified as non-hazardous. Further, as no concentrations of explosives or other analytes were found at significant levels, these wastes are also considered non-contaminated for the purpose of disposal. These wastes are recommended for disposal through the RVAAP wastewater treatment plant.

In addition to aqueous decontamination fluids, an acid rinse was generated from the field activities. Field pH measurements indicate an acidic pH of 3 which is above the RCRA D003 criteria of ≤ 2 . As only trace contaminants were found in the material it is recommended that the acid rinse be pretreated through neutralization and disposed of through the RVAAP wastewater treatment plant.

5.5 CONTAMINATED PPE

PPE generated during the sampling event is not considered a hazardous waste based upon analytical results from the sampling of decontamination fluids. These analyses were used for comparative purposes as PPE is decontaminated prior to disposal. As such, the PPE generated by the sampling event is recommended for disposal as sanitary solid waste.

5.6 SUMMARY OF RECOMMENDED DISPOSAL OPTIONS

Table 5-1 presents a summary of the waste classification and recommended disposal options presented in Section 5.

5.7 SUMMARY OF DISPOSAL ACTIVITIES

Disposal of potentially RCRA hazardous waste drums has been completed at an off-site permitted disposal facility. Prior to disposal, the four potentially hazardous waste drums were additionally tested using the RCRA TCLP methodology and were determined to be nonhazardous. Disposal of all water IDW has also been completed, with the approval of the OEPA, at the RVAAP wastewater treatment plant. In January 1997, 29 drums and the Decon Wash/Rinse Polytank were processed through the Load Line 12 Pink Wastewater Treatment Plant. The acid rinse water contained in drum Decon-02 was additionally neutralized prior to treatment plant processing.

Soil and sediment IDW containers remain staged within the AOC of origin pending further consideration of the recommended disposal options. Following a decision regarding these disposal

options, these containers will be disposed of accordingly and in compliance with applicable state and federal laws and regulations.

Disposal Options:

A = Off-site disposal at appropriately permitted facility.

B = On-site disposal at RVAAP Wastewater Treatment Plant.

C = Temporarily stored on-site pending AOC remediation and IDW treatment.

D = Permanently stored at RVAAP.

E = Dispose as sanitary solid waste.

APPENDIX B

BACKGROUND ANALYTICAL DATA SUMMARY

Ravenna Soils
Summary of Site Results and Comparison to Background
All Analytes Measured

1

----- Media=Soil Area=Building 1200 Group=0 - 2 feet Analysis Type= / Units=MG/KG -----

Analyte	>Detection Limit	Site Background Criteria	Detects		USGS Reference Values	Ohio Values	Site Related?	Justification
			>Site Background Criteria	Minimum Detect				
CYANIDE	1/ 1	-		0.2100	0.2100		Yes	No Background Data Available

----- Media=Soil Area=Building 1200 Group=0 - 2 feet Analysis Type=Metals Units=MG/KG -----

Analyte	>Detection Limit	Site Background Criteria 1	Detects		USGS Reference Values 2	Ohio Values	Site Related?	3 Justification	4
			>Site Background Criteria	Minimum Detect					
ALUMINUM	2/ 2	15600.00	0/ 2	11500.0000	12200.0000	20000 - 100000	No	Below Background	
ANTIMONY	1/ 1	-		1.1000	1.1000		Yes	No Background Data Available	
ARSENIC	2/ 2	19.60	0/ 2	13.8000	13.9000	5.2 - 27.0	No	Below Background	
BARIUM	2/ 2	75.00	1/ 2	69.9000	75.8000	300 - 700	Yes	> 5% Detect Above Background	
BERYLLIUM	1/ 1	-		0.6000	0.6000	1.5 - 2.0	Yes	No Background Data Available	
CADMIUM	2/ 2	0.29	0/ 2	0.1400	0.2800		No	Below Background	
CALCIUM	1/ 1	-		1880.0000	1880.0000	1100 - 31000	No	Essential Element	
CHROMIUM	2/ 2	18.70	0/ 2	14.3000	15.6000	15.0 - 100.0	No	Below Background	
COBALT	1/ 1	-		8.8000	8.8000	7 - 20	Yes	No Background Data Available	
COPPER	1/ 1	-		15.0000	15.0000	7.0 - 70.0	Yes	No Background Data Available	
IRON	1/ 1	-		22800.0000	22800.0000	15000 - 50000	Yes	No Background Data Available	
LEAD	2/ 2	17.90	1/ 2	17.4000	24.7000	15 - 30	Yes	> 5% Detect Above Background	
MAGNESIUM	1/ 1	-		2410.0000	2410.0000	3000 - 15000	No	Essential Element	
MANGANESE	2/ 2	728.00	0/ 2	265.0000	426.0000	150 - 1000	No	Below Background	
NICKEL	1/ 1	-		18.6000	18.6000	15 - 50	Yes	No Background Data Available	
POTASSIUM	1/ 1	-		932.0000	932.0000	11800 - 25100	No	Essential Element	
SELENIUM	2/ 2	2.60	0/ 2	0.6300	0.7600	<0.1 - 1.2	No	Below Background	
SODIUM	1/ 1	-		143.0000	143.0000	5000 - 7000	No	Essential Element	
THALLIUM	1/ 1	-		1.5000	1.5000		Yes	No Background Data Available	
VANADIUM	1/ 1	-		22.1000	22.1000	20 - 150	Yes	No Background Data Available	
ZINC	2/ 2	72.10	0/ 2	51.5000	59.9000	250000-1100000	No	Below Background	

Results less than the detection limit were set to 1/2 the reported detection limit.

1 Site background values established during Phase I RI.

2 Shacklette and Boerngen 1981 and 1984.

3 Chemical occurrence detected above background in >5% of samples analyzed.

4 Rationale for "site-related" classification.

Generated by program sum_so2 at 09:33 on 14NOV96 using rav_exp dataset.
